

This is a digital copy of a book that was preserved for generations on library shelves before it was carefully scanned by Google as part of a project to make the world's books discoverable online.

It has survived long enough for the copyright to expire and the book to enter the public domain. A public domain book is one that was never subject to copyright or whose legal copyright term has expired. Whether a book is in the public domain may vary country to country. Public domain books are our gateways to the past, representing a wealth of history, culture and knowledge that's often difficult to discover.

Marks, notations and other marginalia present in the original volume will appear in this file - a reminder of this book's long journey from the publisher to a library and finally to you.

### Usage guidelines

Google is proud to partner with libraries to digitize public domain materials and make them widely accessible. Public domain books belong to the public and we are merely their custodians. Nevertheless, this work is expensive, so in order to keep providing this resource, we have taken steps to prevent abuse by commercial parties, including placing technical restrictions on automated querying.

We also ask that you:

- + *Make non-commercial use of the files* We designed Google Book Search for use by individuals, and we request that you use these files for personal, non-commercial purposes.
- + *Refrain from automated querying* Do not send automated queries of any sort to Google's system: If you are conducting research on machine translation, optical character recognition or other areas where access to a large amount of text is helpful, please contact us. We encourage the use of public domain materials for these purposes and may be able to help.
- + *Maintain attribution* The Google "watermark" you see on each file is essential for informing people about this project and helping them find additional materials through Google Book Search. Please do not remove it.
- + *Keep it legal* Whatever your use, remember that you are responsible for ensuring that what you are doing is legal. Do not assume that just because we believe a book is in the public domain for users in the United States, that the work is also in the public domain for users in other countries. Whether a book is still in copyright varies from country to country, and we can't offer guidance on whether any specific use of any specific book is allowed. Please do not assume that a book's appearance in Google Book Search means it can be used in any manner anywhere in the world. Copyright infringement liability can be quite severe.

### About Google Book Search

Google's mission is to organize the world's information and to make it universally accessible and useful. Google Book Search helps readers discover the world's books while helping authors and publishers reach new audiences. You can search through the full text of this book on the web at <http://books.google.com/>

# THE AMERICANA

**R**ichelieu, Chamblay, shān-blā, or Sorel, sō-rél', a river in Canada, in the Province of Quebec; the outlet of Lake Champlain, and a tributary of the Saint Lawrence River. It is 80 miles long, from one to two miles wide in some places and from 1,000 to 1,200 feet in other parts. It is navigable its whole length, except a short distance where rapids are an obstruction. A canal has been built around the rapids. In the valley of this river, Chamblay Valley, were made some of the first settlements in Canada. The river was of importance in the discovery and settlement periods in America, as it was part of the great waterway into the interior; and for over two centuries, beginning with Champlain's Iroquois campaign in 1609, it was the scene of many battles.

**Richelin, Jean, zhōn rēsh-pāh**, French poet and dramatist: b. Medéah, Algeria, 4 Feb. 1849. He began the study of medicine with his father, a physician, but gave it up and entered the Ecole Normale in the Department of Literature. After 1870 he engaged in journalism, editing 'L'Est,' and contributing to 'Mot d'Ordre,' the 'Corsaire' and 'Vérité,' in which latter he published 'Les Etapes d'un Refractaire.' Shortly afterward he published 'Chanson des Gueux,' for which he was fined and obliged to spend a month in prison, during which time he wrote 'Morts bizarres.' Works of this character have placed him among the most advanced of the naturalistic school; the boldness of his expression and the license of his subject have brought to him both applause and condemnation. In reply to criticism he admitted in 1881, in defense of his works, that his coarseness was perhaps unnecessary and repugnant, but not immoral. His works include verses under titles such as 'Caresses' (1877); 'Blasphèmes' (1884); 'La Mer' (1886); 'Mes Paradis' (1894), of romances 'Madame Andre' (1874); 'Sophie Monnier' (1884); 'Césarine' (1888); 'Braves Gens' (1888), besides many others; and of dramas 'Nana Sahib' (1882); 'Monsieur Scapin' (1886); 'Le Filibustier' (1888); 'Par le Glaive' (1892); 'Vers la Joie' (1894); 'Chemineau' (1897). He published also a work entitled 'Théâtre Chimérique' (1896) in 27 acts in prose and verse.

**Richfield, rich'fēld**, Utah, county-seat of Sevier County; on Rio Grande Western railroad; 135 miles south of Salt Lake City. It was incorporated in 1878. It is the centre of an agricultural and stock-raising region. The public school system includes a high school founded in 1896; there is also an association library. Pop. (1910) 2,128.

**Richfield Springs, N. Y.**, village in Otsego County; on the Delaware, Lackawanna & Western railroad; about one mile from Schuyler Lake, 25 miles south by east of Utica, and 13 miles north by west of Cooperstown. It is in a productive agricultural region; but the village is a well-known health resort on account of its large number of mineral springs. It is also

a famous summer resort. Nearby are many places of attraction, as Otsego Lake and vicinity. It has several small manufacturing establishments which more than supply local needs. The place was settled about the middle of the 18th century, but a permanent settlement was not made until after the Revolution. It was one of the favorite localities of the Indian tribes of eastern New York. Pop. (1910) 1,503.

**Richford, rich'fōrd**, Vt., village in Franklin County; on the Missisquoi River, and on the Central Vermont and Canadian Pacific R.R.'s; 45 miles northeast of Burlington. It was first settled in 1795 and incorporated as a village in 1878. The village is built on both sides of the river which affords good water power; the lumber interests exceed all others in importance, and there are several lumber, saw, and planing mills. It is also in a maple sugar and agricultural region, and has a good trade, being a port of entry from Canada. It contains a high school. Pop. (1910) 2,907.

**Richibucto, rich-ē-būkt'ō**, formerly Liverpool, Canada, the capital of Kent County, New Brunswick, at the mouth of Richibucto River, 46 miles northeast of Saint John. It is a port of entry and the eastern terminus of a branch line connecting with the Intercolonial Railway at Kent Junction. The river is navigable for 15 miles, and there is a considerable export trade in lumber and fish. Ship-building is carried on.

**Richland (rich'land) Center, Wis.**, city, county-seat of Richland County; on Pine River and on the Chicago, Milwaukee & St. Paul railroad; 55 miles north-northwest of Madison. It was settled in 1849 and was made the county-seat in 1852. It is the centre of an agricultural, stock-raising, and dairying region, and has a large export trade in flour, cheese, etc. The river furnishes water power for manufacturing; and the city contains flour and saw mills, a tannery, and brick kiln. There is a public high school. Pop. (1910) 2,392.

**Richman, rich'man, Irving** **Berdine**, American lawyer and diplomat: b. Muscatine, Iowa, 27 Oct. 1857. He was graduated from the State University of Iowa in 1883 and admitted to the bar in 1885. He was elected to the lower house of the State legislature in 1889 and 1891, and was United States consul-general in Switzerland, with residence at Saint Gall, 1893-8. He has published: 'John Brown Among the Quakers and Other Sketches' (1894); 'Appenzell; Pure Democracy and Pastoral Life in Inner Rhoden' (1895); 'Rhode Island: Its Making and Meaning,' a historical work of much importance (1902).

**Richmond, rich'mōnd**, Countess of. See **BRADFORD, MARGARET**.

**Richmond, Dean**, American capitalist: b. Barnard, Vt., 31 March 1804; d. New York 27 Aug. 1866. He engaged successfully in the refining and selling of salt at 15, was a director in a Syracuse bank before he was of age and afterward engaged as a shipping and produce

## RICHMOND

merchant at Buffalo. He was a leader in the movement which consolidated seven separate corporations into the New York Central Railroad Company in 1853, was its vice-president in 1853-64 and president in 1864-6. He was a recognized political leader but declined public office.

**Richmond, Legh,** English clergyman: b. Liverpool 29 Jan. 1772; d. Turvey, Bedfordshire, 8 May 1827. He was graduated from Cambridge in 1794, took orders in the Church of England in 1797, and in 1798 became curate of Brading in the Isle of Wight. In 1805 he was appointed chaplain in the Lock Hospital, London, and later in the same year became rector at Turvey, where he remained until his death. He was well known as a leader in the evangelical party, and wrote several tracts which were widely circulated, among them: 'The Dairyman's Daughter,' of which more than 4,000,000 copies in 19 different languages were circulated; 'The Negro Servant,' etc. He also published: 'The Fathers of the English Church, or a Selection from the Writings of the Reformers and Early Protestant Divines of the Church of England' (8 vols., 1807-11). Consult: 'Life,' by Grimshawe (1826, edited by Bodell 1846).

**Richmond, Sir William Blake,** English painter: b. London 29 Nov. 1843. He studied in the schools of the Royal Academy, where he received two silver medals in 1857 and had his portrait of his two brothers hung at the exhibition in 1861. He has traveled extensively in Italy, Greece, and Egypt studying the remains of ancient art, whence he has derived many subjects for his work. From 1878 to 1883 he was Stude professor at Oxford. His works include 'The Procession of Bacchus' (1865-8); 'The Life of Women' (1870), a series of frescoes for J. S. Hodgson of Haslemere; 'Electra at the Tomb of Agamemnon' (1877); 'Behold the Bridegroom Cometh' (1881); 'Release of Prometheus' (1882); 'Audience at Athens during the Representation of Agamemnon' (1885), now in the Birmingham Gallery. He has painted portraits of Darwin, Gladstone, Browning, William Morris, Holman Hunt, and Lord Lytton. Most notable of his works are the interior decorations and the glass mosaics of St. Paul's Cathedral. This work was executed by a staff trained under his personal supervision. He is an earnest advocate of the development of mosaic work in England, believing that this art should be applied only in the country and under the conditions of light in which the finished product is to remain. In 1895 he became a Royal Academician, and has been professor of painting at the Royal Academy. Consult his article on Mosaics in Vol. XXXI. of the New Volumes of the 'Encyclopædia Britannica.'

**Richmond, Australia,** a city of Victoria, suburban to Melbourne (q.v.). Pop. 38,000.

**Richmond, Canada,** the capital of Wolfe and Richmond counties, Quebec, 76 miles east of Montreal, on the Saint Francis River, an affluent of the Saint Lawrence. Its chief institution is Saint Francis College, affiliated to McGill University. The town has railway works, machine shops, and other industrial establishments.

**Richmond, England,** an ancient town in the county and 42 miles northwest of York (North Riding), on the left bank of the Swale. In and around the town are numerous interesting remains of antiquity, the most remarkable of which is the castle, comprising an area of nearly six acres, and one of the most majestic ruins in England; its great tower, about 100 feet high, is a fine and very perfect specimen of the Norman keep.

**Richmond, Ind.,** city, county-seat of Wayne County; on the Whitewater River, and on the Pittsburg, C. & St. L., the Grand Rapids & I. R.R.'s; 68 miles east of Indianapolis and 70 miles northwest of Cincinnati. The Richmond Interurban and the Dayton & Western traction lines connect the city with all nearby places. Richmond was settled and platted in 1816 by Friends from North Carolina. It was incorporated in 1834 and chartered as a city in 1840. The city has about 300 manufacturing establishments, employing about 3,500 persons. The chief manufactures are threshers, drills, plows, engines, boilers, carriages, milling machinery, clothing, flour, and dairy products. It is the commercial and industrial centre of a large portion of the county. It has a number of fine public buildings, chief of which are the churches and schools. There are 26 churches, 10 public school buildings, two Roman Catholic parish schools, and one Lutheran parish school. Other educational institutions are Earlham College (Friends), Saint Mary's Academy (R. C.), one business college, and the Morrison-Reeves Free Public Library. The Eastern Indiana Insane Hospital, a State institution, is located here; also other charitable institutions. The three National banks have a combined capital of \$350,000; the annual amount of business is \$2,400,000. The government is vested in a mayor and a council of 14 members elected biennially by the people. The metropolitan police board is appointed by the governor. Pop. (1910) 22,324.

B. F. WISSLER,  
Editor 'Sun-Telegram.'

**Richmond, Ky.,** city, county-seat of Madison County; on the Louisville & N. and the Louisville & A. R.R.'s; about 25 miles south-southeast of Lexington and 135 miles east-southeast of Louisville. It is in an agricultural region; in the vicinity is found an excellent building stone. The chief manufactures are tobacco and dairy products, and the trade is chiefly in farm and tobacco products, cattle, and horses. Its educational institutions are Madison Institute, under the auspices of the Church of the Disciples, Walter's Collegiate Institute, a Presbyterian institution, and public elementary schools. One of the most desperate battles of the Civil War was fought at Richmond. The Confederate forces under E. Kirby Smith defeated a much larger Federal force under Manson and Nelson. Pop. (1890) 5,073; (1900) 4,658; (1910) 5,340.

**Richmond (Ky.), Battle of,** the most decisive Confederate victory of the Civil War. On 14 Aug. 1862 Gen. E. Kirby Smith left Knoxville, Tenn., to unite with Gen. Bragg in northern Kentucky. He passed through Big Creek Gap of the Cumberland Mountains and, leaving Gen. Stevenson's division to observe

## RICHMOND

the Union forces at Cumberland Gap, penetrated Kentucky with about 6,000 men. Preceded by Col. J. S. Scott's cavalry force of 900 men, he moved in the direction of Frankfort, threatening both Louisville and Cincinnati. Gen. Lew Wallace, with a regiment, hastened from Louisville to Lexington, and there found other forces, over which he was placed in command; new regiments came from north of the Ohio; but as Wallace was about to move forward and oppose Smith he was superseded by Gen. Nelson, who had been ordered by Gen. Buell to take charge of affairs in Kentucky. Upon his arrival Nelson organized the troops at Lexington into a division of three brigades, under Gens. M. D. Manson, Charles Cruft, and J. S. Jackson; and hearing that the Confederates were approaching, he sent forward some Kentucky cavalry to oppose them. There were several sharp cavalry affairs, in which the Union cavalry showed such aggression that Kirby Smith determined to make an immediate attack upon the Union forces at Richmond, although his troops were jaded by long and laborious marches, and Gen. Heth's division of 4,000 men was still far to the rear. He had for the attack Cleburne's and Churchill's divisions of 6,000 men and Scott's cavalry brigade of about 850, and the advance was ordered for the morning of 30 August. Scott's cavalry encountered Manson's brigade about half a mile south of Rogersville, and Cleburne, coming up with two brigades, attacked Manson, who, reinforced by a regiment of Cruft's brigade and a battery, endeavored to turn Cleburne's right, but was repulsed. Meanwhile Churchill's division had come to Cleburne's support; a brigade flanked Manson's right and drove it back in disorder; and as the rout became general, another of Cruft's regiments came up, but was quickly repulsed with heavy loss. Another position was taken farther to the rear, where the troops were under partial cover, with artillery on the flanks. This the Confederates soon attacked; Churchill's division struck Cruft's brigade, which was on the right, and drove it back in disorder; and Cleburne advancing in front, Manson's entire line went back, the Confederates in close pursuit. Manson had but partially formed another line in front of Richmond, when Gen. Nelson came on the field and selected a new line near the town and cemetery; and the troops, barely 2,200 in number, had scarcely taken position when the Confederates were upon them in flank and front, fired about three volleys, and the Union troops gave way in utter rout. Early in the day Scott's cavalry had gained the road in rear of Richmond, and the knowledge of the fact increased the demoralization. Nelson, wounded, narrowly escaped to Lexington and thence to Louisville. Manson was wounded and taken prisoner, with over 4,000 of his men, while nine guns, over 6,000 muskets, and the entire wagon-train were lost. The fragments of the army made their way to Louisville. The Union troops engaged numbered 6,500 raw men; the Confederates about 6,800 veteran troops. The Union loss was 206 killed, 844 wounded, and 4,303 captured or missing, an aggregate of 5,353. The Confederate loss was 78 killed, 372 wounded, and one missing, an aggregate of 451. Gen. Heth, with his division of 4,000 men, joined Smith after the battle, and marched to Lexington,

where he arrived 2 September, and the legislature, then in session at Frankfort, fled to Louisville. Heth marched northward to Cynthiana, and to within a few miles of Covington, to threaten Cincinnati, which he found too well defended to attack, and being in turn threatened, he withdrew to join Smith, who waited at Lexington to join forces with Gen. Bragg, then operating against Gen. Buell. (See *PERRYVILLE BATTLE OF*. Consult: 'Official Records,' Vol. XVI.; Van Horn, 'History of the Army of the Cumberland,' Vol. I.; The Century Company's 'Battles and Leaders of the Civil War,' Vol. III. E. A. CARMAN.

**Richmond, Maine**, town in Sagadahoc County, on the Kennebec River and on the Maine Central railroad, 37 miles north-northeast of Portland. It was first settled in 1700; in 1719-20 a fort was erected here for the defense of the settlers against the Indians; this fort twice resisted attack, and was finally dismantled in 1754. The town was incorporated in 1823. The chief industries of the town include a cotton mill and shoe factory, ice cutting, and agriculture; there are also saw and planing mills and some trade in lumber. The town has a public high school, with which the Richmond Academy (incorporated 1861) was united, and also a public library. Pop. (1890) 1,394; (1900) 2,097; (1910) 1,858.

**Richmond, Mo.**, city, county-seat of Ray County; on the Atchison, Topeka & Santa Fe railroad; 58 miles southeast of St. Joseph. The county-seat was removed to Richmond from Bluffton in 1827. It is the centre of a fertile agricultural and stock-raising region; and there are coal mines in the vicinity which yield excellent quality of bituminous coal. It also has wagon and plow factories, flour mills, and a foundry. It contains the county court-house, and has electric lights and modern waterworks. It is well provided with educational facilities, having two public high schools, of which one, the Lincoln high, is for colored pupils; and is also the seat of Woodson Institute, a coeducational secondary school under the auspices of the Methodist Episcopal Church, South. Pop. (1910) 3,664.

**Richmond, Va.**, city, port of entry, capital of the State; county-seat of Henrico County; on the James River, the Richmond-Washington Line, the Atlantic Coast Line, the Chesapeake & Ohio, the Seaboard Air Line, and the Southern R.R.'s; about 115 miles almost due south of Washington, D. C., and 90 miles from the mouth of the river at Chesapeake Bay. Area 4.85 square miles, but including the suburbs, 16 square miles. The surface is hilly, rising from the river and the valley of Shockoe Creek in a series of hills, almost terrace-like in formation, until it reaches altitudes of from 170 to 250 feet above sea-level, at which altitudes there are plateaus constituting the principal residential sections. It was originally built on seven hills, and was often called the "Modern Rome." In 1842, when Charles Dickens visited the city, it had extended its limits to another hill, and he wrote of it as "delightfully situated on eight hills overhanging James River."

Regular lines of steamers, the Virginia Navigation Company and Old Dominion, connect

## RICHMOND

the city with Atlantic and Chesapeake ports, and furnish a cheap outlet for shipping products to other parts of the United States and to foreign ports. James River (q.v.) furnishes water power which is used extensively for manufacturing and of the total horse-power 14,000 utilized, 10,000 horse-power being electrically developed, it propels the entire street car system and supplies the electric lights of the city. Several bridges (four railroad and two for vehicles, street cars and foot passengers) cross the river and connect the city with Manchester, and beyond its suburbs with Forest Hill Park, Bonair, Granite, Spring Hill, and other places. A seventh is being constructed especially for the street cars.

There are about 120 miles of streets, 40 miles of which are sewered, and about 30 paved. The streets are all fairly wide. Main, the chief thoroughfare, is a broad, well-built street; Broad is the widest street in the city; Grace and West Franklin, as well as some of the suburbs, are residential sections. The water supply, which when clear is most excellent for domestic and all other purposes, is obtained from the James River at two points above the city. The water is pumped into two reservoirs from which it is piped for distribution throughout the city, and an extensive settling basin and system for insuring its clarification at all times is being pushed to completion. The natural drainage makes the city healthful, and warm winters and temperate summers attract many home seekers who desire a mild climate.

**Industries.**—The chief industries of the city are connected with the preparation of tobacco for local use and for shipment to outside markets. The Federal census of 1900 gives 49 establishments for the manufacturing of tobacco; the amount of capital invested, \$3,054,450, and the value of the products for the year mentioned, \$10,537,803. There were 5,666 employees, to whom were paid \$1,506,090 wages for the same year. The establishments were 17 smoking and chewing tobacco factories, 22 cigarette and cheroot factories, and 10 stemmeries and packing houses. The foundries and machine shops number 18 establishments, with invested capital, \$5,164,103; and the annual value of products \$2,594,186. There were six establishments engaged in preparing fertilizers for market. The invested capital was \$2,163,731, and the value of the products, \$1,045,063. Other manufacturing establishments were wagon and carriage works, lumber mills, railroad car factory, confectionery factory, and baking powder works. In 1900 the city contained 380 manufacturing establishments which represented 100 different industries. The capital invested in manufacturing concerns was \$30,660,000, there were 26,098 persons employed, and the annual wages amounted to \$3,307,000. The amount paid for raw material the same year was \$24,252,000, and the total product for the year was valued at \$47,358,000.

**Commerce.**—The location and the facilities for transportation make Richmond the commercial centre of a large extent of southeastern Virginia, and an important point of distribution for the Carolinas and adjoining Southern States. For the year ending 30 June 1900, the custom house records showed the amount of imports as \$666,984; but these figures are entirely misleading as a measure of its foreign trade, as

its imports and exports are principally cleared through the custom-houses of New York and other northern ports. The amount of trade with the United States Atlantic coast cities and the cities and towns of the interior of the State is very large.

**Banking and Finances.**—The city had over 30 banking institutions in 1910, including 6 national banks. There were also state banks, savings banks, trust companies, private bankers and brokers, and loan and deposit companies. The amount of exchanges of the Richmond clearing house for the year ending Sept. 30, 1910, was \$385,865,200; total resources of State and national banks, about \$35,000,000. The assessed valuations of the city in 1910 were, real, \$44,560,516; personal, \$37,063,705; total, \$137,516,468. The receipts for a single year a decade ago were something over \$1,875,000; and the expenditures a little less. The chief items of expense in the budget for 1904 were, to the sinking fund for interest and redemption, \$473,311.26, a special appropriation of \$20,000 for opening and widening streets and one of \$20,000 for a new gas holder in west end are also in this budget; for schools, \$170,743.74; police department, \$113,100; fire department, \$116,150; waterworks, \$78,385; gas works, \$191,500; streets, \$183,010. The net public debt was (1910) \$8,804,263. The municipal assets, including waterworks, gas plant, city-hall, parks, market-houses, school buildings, etc., were valued at \$8,000,000, and there was to the credit of the sinking fund in bonds and cash something over \$830,000.

**Public Buildings, Parks, and Monuments.**—Richmond is historic ground and her noted public buildings are valued more on account of their association than for the architectural merits which they possess. Capitol Square, on Shockoe Hill, has an area of 12 acres. It takes its name from the State Capitol which is on the square. The Capitol was built after a model procured by Thomas Jefferson when he was in France, and which was patterned after Maison Quarries of Nimes, an ancient Roman temple, only changing the columns from the Corinthian to the Ionic. The corner-stone was laid in 1785, and on 19 Oct. 1789, the eighth anniversary of the surrender of Lord Cornwallis at Yorktown, the Virginia State Legislature convened in the new Capitol. The model for the Capitol sent from France by Jefferson is still in the building. In the rotunda is the most valuable piece of marble in America, Houdon's statue of Washington, modeled from life. The General Assembly of Virginia (1903-1904) appropriated \$250,000 for the purpose of adding wings to the east and west sides of this building, for steps to the imposing portico at the southern end, and for some interior improvements. These additions will be in harmony with the architectural style of the original building, will preserve its most characteristic features and furnish additional room, much needed by the General Assembly and the various State departments.

On the same square is the library building, which contains the parole signed by Lord Cornwallis at Yorktown, the original Virginia Bill of Rights, and the Virginia ordinance of secession. The executive mansion is on this square, on land which was once a part of Nathaniel Bacon's plantation. The old building known as the Bell House has many interesting associations.

## RICHMOND

The old bell, purchased in 1790, was for years a "voice to the people."

Among the famous pieces of statuary on the grounds is the equestrian statue of Washington, by Thomas Crawford (q.v.). Of the statues at the base Crawford completed only Thomas Jefferson and Patrick Henry; the other pieces, George Mason, John Marshall, Thomas Nelson, and Andrew Lewis, were made by Randolph Rogers. Nearby stands a fine marble statue of Henry Clay, by Joel T. Hart; also several other marble statues and a bronze statue of "Stonewall" Jackson, by Foley. Three fountains add to the beauty of the square. The largest park of the city has an area of 300 acres. It has a lake, a fine boulevard, and the chief reservoir. Monroe Park has many fine trees and some good pieces of statuary. Libby Park is on Libby Hill. It is terraced from Main Street to the summit, and a monument in honor of the Confederate soldiers and sailors stands on the highest point. Chimborazo Hill Park has an area of 36 acres. A Government road leads from the park to the National Cemetery where are buried 6,547 Federal soldiers who fell in the attempts to capture the city during the Civil War. Jefferson Park is between Pleasant and Marshall streets; Gamble's Hill Park is on a relic of the James River and Kanawha Canal, still used as a race to a number of important water-power plants. It also overlooks the famous Tredegar works where cannon were made, and the no less famous Belle Isle, the site of the Old Dominion Iron and Nail Works, where a number of Federal prisoners were confined during the war between the States. Lee Circle, in the western part of the city, has a bronze equestrian statue of Robert E. Lee (q.v.), by Mercie, a French sculptor. It represents the General on "Traveller," his well-known war-horse. In Howitzer Park is a monument in memory of the Richmond Howitzer battalion. A favorite drive is the one to Hollywood, where sleep 12,000 Confederate soldiers. A monument of granite, pyramidal in form, 90 feet high and softened by a covering of Virginia creeper and ivy, has been erected to the memory of the Confederate dead soldiers. Many of Virginia's famous men are buried here. Tyler and Monroe, Presidents of the United States; John R. Thompson, the poet; Matthew F. Maury, "Pathfinder of the Seas"; John Randolph; Jefferson Davis, president of the Confederacy, and a number of Confederate Generals. The most noted parks and squares have a combined area of 358 acres; but the little squares and circles, not mentioned as noted, ornament the city, and give it an artistic air.

Other historic and prominent landmarks are the residence occupied by General Lee and his family, now the home of the Virginia Historical Society; the house occupied by Jefferson Davis while he was president of the Confederate States; and the famous Monumental Church on Broad Street, formerly called Academy Square. At one time a large wooden building, built for an Academy of Fine Arts, occupied the present site of the church. In 1788 the old building saw a brilliant gathering of "history makers," who met to discuss the document proposed as the Constitution of the United States of America. Madison, Mason, Marshall, Pendleton, Randolph, Lee, Wythe, and others were

there, and finally the Constitution as framed at Philadelphia was ratified by Virginia. Only 23 years afterward occurred in the same building at a theatre the terrible disaster which resulted in the death of 72 persons, among whom was the Governor of the State. The present church is their monument; the portico extends over their tombs and the charred remains. The house once the home of Chief Justice Marshall stands on the street named in his honor. Saint John's Episcopal Church, built in 1740, is in an excellent state of preservation and is still used for religious services. Richard Randolph, who superintended the building of the church, was a descendant of Pocahontas. In the quaint old churchyard surrounding it is the grave of George Wythe, one of the signers of the Declaration of Independence. In this church, on 20 March 1775, was held the famous Virginia Convention which met to hear a report of the first Continental Congress, and to discuss the political situation of the country. The convention feared to hold a session in Williamsburg, the capital, on account of the hostility of Lord Dunmore. The church was the only place in Richmond large enough to contain the convention. It was at this convention that Patrick Henry made his famous speech, ending with the words: "Is life so dear, or peace so sweet, as to be purchased at the price of chains and slavery? Forbid it, Almighty God! I know not what course others may take, but as for me, give me liberty or give me death." The place where the patriotic orator stood is pointed out to strangers. Another remarkable event occurred on 6 Jan. 1781, when Benedict Arnold, at the head of a British force of 900, entered the city, and a number of the soldiers were quartered in this old church. The oldest house in Richmond, a stone building on Main Street, was built in 1737 by Jacob Ege. It is now used as a historical museum. The Valentine Museum contains over 100,000 archaeological specimens, also many fine pictures and statues. This valuable museum was given to the city by Mann S. Valentine. His brother, Edward V. Valentine, the sculptor, has given to the museum several valuable pieces of statuary.

The most costly and the most ornate building in the city of Richmond is the City-Hall, completed about 10 years ago, at an outlay of over \$1,400,000. It is built of Richmond granite, dressed and quarry-faced, is completely fire-proof, commodious in all its appointments and should fully meet all of the requirements of the city for the next hundred years or more.

**Education.**—The city has an excellent school system; there are public and parish elementary schools for white and similar ones for colored pupils, a high school, normal school for whites and one for colored, Virginia Mechanics' Institute, which has evening classes, kindergartens, and a number of private schools. The secondary schools and colleges are the Richmond Female Institute (Baptist), founded in 1854; Richmond Female Seminary (P. E.); Hartshorn Memorial College for Colored Girls (Baptist), opened in 1883; Visitation Academy (R. C.), founded in 1860; Saint Peter's Academy (R. C.); Saint Joseph's Academy (R. C.); Saint Patrick's Academy (R. C.); Sacred Heart Academy (R. C.); Saint Mary's Benedictine Institute (R. C.); Training School for Kindergartners; Art School.

## RICHMOND

of Art Club, and Saint Andrew's School, the Medical College of Virginia (1837); University College of Medicine (1893); Richmond Theological Seminary (Baptist), opened in 1867; Richmond College (Baptist), opened in 1832; and beyond the city limits, Hartshorn and two others. There are five public libraries with an aggregate of 60,000 volumes.

**Churches.**—The city has 130 religious organizations and 90 church edifices; 65 for white people and the others for colored. The different denominations rank according to church edifices and organizations as follows: Baptists, Protestant Episcopalians, Methodists, Presbyterians, Roman Catholics, Lutherans, Jews, Christians, Friends. The Roman Catholic Cathedral, being built with means supplied through the munificence of Mrs. Thomas F. Ryan of New York, will be the finest church edifice in the city.

**Charitable Institutions.**—There are here Saint Sophia's Home for the Aged; the Sheltering Arms; the Home for Incurables; Foundling Asylum; Retreat for the Sick; City Orphan Asylum; Lee Camp Soldiers' Home; and Saint Joseph's Orphan Asylum. There are a number of public and church aid societies and various charitable organizations.

**Hospitals.**—Saint Luke's Hospital is one of the best equipped institutions in the city.

**History.**—In May 1607, John Smith, Captain Newport, and others ascended the James River as far as the place where Richmond now stands. In September, 1609, Smith, who was the president at Jamestown, again ascended the river to find a better location for the colony than Jamestown. He purchased from the Indians some land near the present site of Richmond, and so pleased was he with the place that he called it "None Such."

"Forte Charles" was built below the falls, in 1645. In 1675 and in 1687 a further grant of 950 acres, which tracts included the land upon which Richmond now stands; but the city was not founded until some years later by his son, Colonel William Evelyn Byrd. This founder of Richmond seems to have been versed in methods of founding cities which are now called modern. He established two cities "on paper," one at Sohocco's, to be called Richmond, and at the "Point of Appamattuck River," to be called Petersburg. He engaged Major Mayo to lay out the squares, streets, etc. Then he proceeded to advertise his cities, inserting a notice in the Virginia 'Gazette,' April 1737, "that on the north side of James River, near the uppermost landing and a little below the falls, is lately built by Major Mayo a town called Richmond, with streets 60 feet wide, in a pleasant and healthy situation, and well supplied with springs of good water." Byrd was a learned man as well as a good advertiser. He brought to the New World a large and well selected library, a catalogue of which is in the Franklin Library in Philadelphia. He proceeded to build a mill, a warehouse, and such other buildings as were necessary. In its early days the place was called Byrd's Warehouse. In 1742 the Assembly of Virginia established the town, and the wide streets and squares were at last laid out. In 1779 the capital of the commonwealth was removed from Williamsburg to Richmond. Then the place was only a number of disconnected houses in small groups, with rough ground and

rocks intervening. Benedict Arnold entered the city in 1781 and burned a portion of it, as has been mentioned above.

In 1782 Richmond was incorporated as a city, and in 1785 the foundation of the Capitol was begun. This Capitol, from its opening in 1789 down to the present, has been the scene of many stirring historical events. In 1798-9 took place the famous debates which ended in the adoption of the resolutions, drafted by James Madison, regarding the interpretation of the Federal compact. What powerful conventions were held here when such men as Monroe, Madison, John Randolph, and Marshall were members. The convention of 1851 extended the privilege of suffrage, and here in 1861 the Act of Secession was adopted; and in June of the same year, Richmond was made the capital of the Confederate States. In July 1862, the Congress of the Confederacy convened here, and remained in session until April 1865. During the Civil War the city was the great objective point of the chief operations of the Union Army in the East. Again and again the Union forces marched to the battle cry "On to Richmond," and again and again were they repulsed. For three years, from May 1862 to April 1865, the city was almost in a state of siege; the records tell of 15 pitched battles and 25 skirmishes and sharp engagements which were fought in efforts to capture the city. When its defenders yielded, and left the city, they set fire to the arsenals and large tobacco warehouses, and burned the bridges directly after crossing them, which caused a most extensive conflagration in the principal business sections of the city. On 27 April 1870, at a contest over the mayoralty before the Supreme Court of Appeals, over 60 persons were killed by the giving away of the floor of the court room. A large number of people were in the building.

The suburbs of Richmond contribute to the charms of the city and to its history pages. The lines of earth work defenses and the marks of shot and shell are still visible. The broad, shady avenues of stately, beautiful trees lead out to battle grounds now covered with the houses and business establishments of busy, peaceful people.

Pop. (1890) 81,388; (1900) 85,050. But these figures to no extent marked the growth and prosperity of the city. With the exception of the annexation of Lee District, which was just beginning to be built up, the corporate limits had not been extended since 1867, and in many quarters the suburbs were quite quickly settled, and were undistinguishable from the adjacent districts of the city.

The rural free delivery of the Richmond post-office served a suburban population of from 25,000 to 30,000, most of which was added to the city population when the much needed expansion of the city limits went into effect. This placed it, where it legitimately belonged, in the ranks of cities beyond the 100,000 limit. Pop. (1910) 127,628.

## RICHMOND

**Richmond (Va.), Kilpatrick's Expedition**  
 28. In February 1864 a cavalry expedition organized to make a dash on Richmond, distribute President Lincoln's amnesty proclamation, and liberate the Union prisoners in the city and on Belle Isle. The expedition was put under command of Gen. Kilpatrick, who, with 4,000 men and a battery of artillery, marched from Stevensburg, crossed the Rapidan at Ely's Ford, early on the night of 28 February, and moved swiftly to Spottsylvania Court House. Here Col. Ulric Dahlgren, with 500 men, was detached from the column, on the morning of the 29th to cross James River and enter Richmond from the south. Kilpatrick continued his course to the Virginia Central Railroad at Beaver Dam Station, thence to Ground Squirrel Bridge over the South Anna, and to a point five miles from Richmond, which was reached on the morning of 1 March. Believing that his approach was unknown, and that a small force of infantry only occupied the intrenchments, he moved on the Brook road toward the interior line of defensive works, driving in a few pickets, and found infantry and artillery in the works—300 men and six guns. He opened with artillery, and was about to attack, when he thought he saw reinforcements of infantry filing into the Confederate works, and, feeling certain that Dahlgren had failed, and that his own attack would be a bloody failure, he withdrew to Atlee Station, north of the Chickahominy, and went into camp. Here he was attacked during the night by Wade Hampton's and Bradley T. Johnson's cavalry, the latter having followed him from Beaver Dam Station. The camp of one of his brigades was captured, and Kilpatrick, retreating, was followed down the Peninsula, being joined near Tunstall's Station next day by nearly 300 of Dahlgren's men. He reached Williamsburg on the night of the 3d.

Col. Dahlgren moved from Spottsylvania Court House across the Virginia Central Railroad, near Fredericksburg, to James River, near Goochland Court House, where he expected to cross the river, release the prisoners on Belle Isle, and enter Richmond from the south, to unite with Kilpatrick at 10 A.M. of 1 March. But he could find no ford, so marched by the north bank of the river, approaching Richmond late in the afternoon, and coming upon cavalry and infantry, with which he skirmished sharply until night. Hearing nothing from Kilpatrick, except his guns, heard early in the afternoon, and rightly believing that he had failed, Dahlgren withdrew, designating Capt. Mitchell, of New York Cavalry, to command the rear guard. In the darkness the column became broken, Dahlgren, with less than 100 men going in one direction, and Mitchell in another. Mitchell succeeded in joining Kilpatrick at Tunstall's with about 260 men. Dahlgren crossed the Pamunkey at Hanover Town, and the Mattaponi at Aylett's Ford, and about midnight 2 March fell into an ambush and was killed. Others were killed and wounded, nearly all were captured. Capt. Mitchell reports that of the 500 men of Dahlgren's command 61 were killed and wounded, and 138 captured. The total loss of Kilpatrick's command, including Dahlgren's, was about 350. Consult: 'Official Records,' Vol. XXXIII.; Humphrey's 'From Gettysburg to the Rapidan'; The Century Company's 'Battles and Leaders of the Civil War,' Vol. IV. E. A. CARMAN.

**Richmond (Va.), Sheridan's Raid on the Communications with,** a movement which included the battle of Yellow Tavern. At day-break 9 May 1864 Gen. Sheridan, with 10,000 cavalry and six batteries, started from near Todd's Tavern to cut the railroads entering Richmond from the north and northwest. He moved on the Telegraph road, Merritt's division crossed the North Anna at Anderson's Ford at dark and encamped; the rest of the column, harassed by a brigade of Stuart's cavalry, halted for the night on the north side of the river. The march was resumed early on the 10th, several miles of the Virginia Central Railroad destroyed, with rolling-stock and supplies, and at night Sheridan crossed the South Anna, halting at daylight of the 11th on the south bank. Early in the day Davies' brigade encountered Munford's cavalry at Ashland, on the Fredericksburg Railroad, drove it from the place, destroyed the depot and several miles of railroad, and joined Sheridan's main body at Allen's Station. Meanwhile Gen. Fitzhugh Lee's cavalry division had been rapidly marching by a circuitous route to interpose between Sheridan and Richmond, and had reached Yellow Tavern, on the Brook road, six miles from Richmond. Lee had barely 4,900 men. Sheridan's whole force advanced, Merritt's division leading, followed by Wilson's and Gregg's. Merritt attacked and gained the Brook road at Yellow Tavern, but Gen. Stuart, in command of the Confederates, seized a position on his flank and enfiladed his line with artillery. Then Custer's brigade, supported by Wilson's division, charged the flanking force, breaking it and capturing two guns. In this encounter Stuart was mortally wounded. Stuart's detached brigade, under Gen. James B. Gordon, fell upon Sheridan's rear, but Gregg drove it back toward Ashland. Fitzhugh Lee's division retreated toward Richmond. The losses on both sides were severe. Sheridan followed Lee's division and entered the most advanced line of works covering Richmond. Sheridan had intended to keep south of the Chickahominy and march by way of Fair Oaks, to make a demonstration on Richmond. Marching during the night, at daylight of the 12th he entered his force at Meadow Bridge, overlooking the line of the Virginia Central Railroad and the Mechanicsville pike. After demonstrating on the Confederate works, which were found too strong to be attacked, he determined to recross the Chickahominy at Meadow Bridge. The bridge, which had been partially destroyed, was held by some of Gordon's cavalry and a battery on the north side. Merritt's division crossed after a severe engagement, in which Gen. James B. Gordon, commanding the Confederate cavalry, was killed. Meanwhile, Wilson's division could not pass the second line of the Richmond defenses, on the Mechanicsville road, and was attacked by Barton's and Gracie's infantry brigades and some dismounted cavalry, who, advancing from the works, attacked both Wilson and Gregg, at first with success, driving Wilson in some disorder. After a severe contest the Confederates were driven back to their works, and between 3 and 4 P.M. Wilson and Gregg crossed the Chickahominy above Mechanicsville bridge, and Sheridan encamped his corps near Gaines' Mill. Next day he crossed to the south side of the Chickahominy by Bottom's bridge, marched through White Oak Swamp and, on the

## RICHMOND

14th, encamped in the vicinity of Hazel's Landing, on James River. He made several demonstrations on the New Market road, in the direction of Richmond, and having drawn supplies from Gen. Butler's army, started on the 17th to rejoin the Army of the Potomac, marching by way of White House, on the Pamunkey. Detachments were sent to destroy the railroad bridges over the South Anna and to demonstrate on Richmond, and 24 May Sheridan rejoined Grant's army near Chesterfield bridge on the North Anna. The Union loss in the movement from 9 May was 64 killed, 337 wounded, and 224 missing. There are no reports of Confederate losses. Consult: 'Official Records,' Vol. XXXVI.; Humphreys, 'The Virginia Campaign of 1864-5'; Sheridan, 'Personal Memoirs,' Vol. II.; McClellan, 'Life and Campaigns of Gen. Stuart'; The Century Company's 'Battles and Leaders of the Civil War,' Vol. IV.

E. A. CARMAN.

**Richmond (Va.), Union Campaigns Against.** As the capital and political centre of the Southern Confederacy, defended by its best army, Richmond became and continued to be the objective point of the Union armies. The first campaign against it was that of Gen. McDowell, which ended in Union defeat at Bull Run, 21 July 1861. (See BULL RUN, FIRST BATTLE OF.) The next campaign had its base at Fort Monroe, from which, 4 April 1862, Gen. McClellan advanced with the Army of the Potomac up the York Peninsula. After the siege and capture of Yorktown and the battle of Williamsburg (qq.v.), McClellan crossed the Chickahominy, and 30 May his outposts were within five miles of Richmond. Meanwhile, after the destruction, by her commander, of the Confederate ram Merrimac, Capt. John Rodgers, with three Union gunboats, ascended James River until he reached Fort Darling (q.v.), on Drewry's Bluff, eight miles below Richmond, where, 15 May, he was stopped by the fire of heavy guns. Com. Goldsborough, commanding the navy in those waters, now proposed to McClellan to cooperate with him in a joint naval and land attack on Fort Darling, but McClellan declined, preferring to wait until after he should have crossed the Chickahominy. The Confederate authorities were so much impressed with the gravity of the situation, when they heard that the fleet was ascending the river, that the government archives were shipped to Columbia, S. C., and the public funds were kept on cars ready for transportation.

The Confederate defense at Fort Darling was looked upon as the salvation of the Confederate capital. Strong works were now constructed by the Confederates on Drewry's Bluff and on the opposite side of the river, and to the end of the war they barred advance on Richmond by water. Elaborate works were constructed to defend the city from the land side. On 31 May Gen. J. E. Johnston, commanding the Confederate army, advanced from his works around Richmond and attacked McClellan. The battle continued two days, at the end of which the relative positions of the two armies were unchanged (See FAIR OAKS, BATTLE OF.) On 25 June McClellan, in view of a general advance, threw forward a part of his force toward Richmond, gaining some ground, but Gen. R. E. Lee, commanding the Army of Northern Vir-

ginia, assumed the offensive on the 26th by crossing the Chickahominy and attacking McClellan's right, forcing McClellan to retreat to Harrison's Landing, on James River, after a series of hard-fought, bloody battles. (See PENINSULA CAMPAIGN OF 1862; SEVEN DAYS' BATTLES.) Richmond now had some respite. Lee invaded Maryland, and upon his return defended Richmond on the line of the Rappahannock, from which Burnside, in December 1862, and Hooker, in April 1863, unsuccessfully endeavored to force him. Lee again assumed the offensive and marched northward for an invasion of Maryland and Pennsylvania, leaving but a small force at Richmond, and Hooker, 10 June, proposed to march immediately upon the city, capture it, and then send the disposable part of his force to any threatened point north of the Potomac, but the proposition was negated by Gen. Halleck, and Hooker was informed by President Lincoln that Lee's army, and not Richmond, was his true objective. On 14 June Halleck ordered Gen. Dix, commanding at Fort Monroe, to send an expedition to threaten Richmond, and destroy the railroad bridges over the South and North Anna rivers. Dix drew troops from Suffolk and Norfolk, and on the 24th Col. Spear, with about 1,200 men of the 11th Pennsylvania, 2d Massachusetts and 12th Illinois cavalry, was sent by water up York River, landed at White House on the 25th, marched through Hanover Court House, and on the 26th attacked and captured about 100 men of the 44th North Carolina at the bridge of the Virginia Central Railroad over the South Anna, burned the bridge, and returned to White House on the morning of the 27th. Upon Spear's return Dix organized an expedition of 10,000 men, under Gen. Getty, to destroy the bridge of the Fredericksburg and Richmond Railroad over the South Anna, and an expedition of 6,000 men and 14 guns, under Gen. Keyes, to threaten Richmond by seizing Bottom's bridge over the Chickahominy. Both expeditions moved from White House on 1 July. Keyes failed to accomplish anything, being held in check by a small force under Gen. D. H. Hill. Getty, preceded by Spear's cavalry, marched from White House to Hanover Court House, which he occupied on the 4th, his advance reaching the bridge over the South Anna late in the day and making an attack, which was repulsed by Gen. John R. Cooke, who had about 4,000 men. Gen. Foster, who was in command of Getty's advance, destroyed some of the railroad track, and during the night was recalled to Hanover Court House. The depot and track at Ashland Station were destroyed, and on the 5th Getty took up the return march to White House, which was reached on the 7th, his loss being 16 killed, wounded, and missing. Dix returned to Fort Monroe and sent part of his command to the Army of the Potomac.

After the Gettysburg campaign (see GETTYSBURG, CAMPAIGN AND BATTLE OF), Gen. Lee fell back beyond the upper Rappahannock, and Gen. Meade followed. Meade was forced back to Centreville, and, renewing the offensive, pushed Lee beyond the Rappahannock and then beyond the Rapidan. Meade now essayed an advance on Richmond by passing Lee's right, but was checked at Mine Run (q.v.), 28-9 Nov. 1863.

## RICHMOND—RICHTER

On the morning of 6 Feb. 1864 Gen. L. I. Wistar, with 2,200 cavalry and 4,000 infantry, left Williamsburg to make a dash on Richmond and release the Union prisoners there. The cavalry advance arrived at Bottom's bridge, on the Chickahominy, about 13 miles from Richmond, before daylight of the 7th, and found the Confederates in force under Gen. Epps Hunton, and reinforcements coming up by railroad from Richmond. A deserter from the Union army had given information of the proposed movement, troops had been sent from Richmond, Bottom's bridge taken up, and the fords obstructed. The cavalry charged one of the fords and was repulsed by canister fire with some loss, and Wistar desisted from further effort and returned to Williamsburg. To cover this movement and divert Lee's attention from it, the cavalry and two corps of the Army of the Potomac made a demonstration on the 6th upon Lee's army at Morton's Ford, the demonstration continuing on the 7th, with considerable loss. Later in the month Gen. Kilpatrick made a movement on Richmond which resulted in a lamentable failure. (See RICHMOND, KILPATRICK'S EXPEDITION TO.)

The next and final campaign against Richmond was conducted by Gen. Grant, beginning in May 1864. With the Army of the Potomac he advanced from the north, while Gen. Butler, with the Army of the James, crossed to the south side of James River and marched up its right bank. Butler was defeated at Drewry's Bluff (q.v.), 16 May, and confined to his intrenchments at Bermuda Hundred (q.v.). The Army of the Potomac began the campaign by the battle of the Wilderness (q.v.), 5-7 May, and on the 9th Gen. Sheridan set out on his raid, elsewhere described. (See RICHMOND, SHERIDAN'S RAID ON, and the BATTLE OF YELLOW TAVERN.) Grant continued his campaign in a series of sanguinary battles, and after the bloody repulse of Cold Harbor (q.v.) he abandoned the campaign north of the James, crossed to the south side of the river, 14-16 June, and invested Petersburg and Richmond from that side. (See PETERSBURG, MILITARY OPERATIONS AGAINST.) The siege began on 19 June 1864, and continued until 2 April 1865, when Petersburg was assaulted and taken, and that night Richmond was evacuated, the Union troops under Gen. Weitzel occupying it 3 April.

E. A. CARMAN.

**Richmond, Borough of.** See NEW YORK CITY.

**Richmond College,** located at Richmond, Va. It was founded in 1832 by the Baptists under the name of the Virginia Baptist Seminary; the name was changed to Richmond College in 1840. The college was closed during the Civil War; the buildings were used as a hospital by the Confederates, and as barracks by the Federals after their occupation of Richmond. The equipment was largely destroyed and much of the endowment rendered worthless, but the college was reopened in 1866, a new endowment was obtained, and it has since then had a prosperous career and has taken a leading part in Southern educational life. The work of the collegiate department is divided into nine schools, as follows: (1) Latin language and literature; (2) Greek language and literature;

(3) French and German; (4) English language and literature; (5) mathematics; (6) physics; (7) chemistry; (8) philosophy; (9) history. Courses are elected in accordance with the group system, there being three groups; the degree of A.B. and B.S. are conferred; and A.M. for graduate work. There is also a School of Law, which confers the degree of B.L. Women were admitted to the college in 1898. The campus contains 13 acres; the ground and buildings in 1910 were valued at \$600,000; the library contained 15,000 volumes, and the annual income in 1910 amounted to more than \$100,000. The students numbered 343, and the faculty 28.

**Richter, rin'ter, Adrian Ludwig,** German painter and designer: b. Dresden 28 Sept. 1803; d. there 19 June 1884. His father, Carl August Richter, the well-known copperplate engraver, was his first teacher, as he was his father's collaborator in the production of landscapes in black and white. In 1820 he accompanied Prince Nariachkin in a journey through France as draughtsman to illustrate that nobleman's travels; subsequently he spent three years, ending 1826, in Italy. He next applied himself to study the masters of the North Holland School, and chose J. Schnorr as his especial model and standard of excellence. Returning to Germany he was appointed in 1828 to a position in the School of Design at Meissen, which he held for 10 years, meanwhile acquiring a popular reputation as illustrator of 'The Vicar of Wakefield' and 'Popular Books of Germany.' He inaugurated an epoch in German illustrative art by his sympathetic interpretation of common life in Germany, his tender humor and refined fancy. While he drew on wood for book illustration, he also executed numerous etchings, mostly of Italian landscapes. The most important of his landscapes in oil, which, however, are marred by a certain coldness of treatment, are: 'Storm on Mount Gerone' (1830, in the Museum, Frankfurt-on-Main); 'Harvest Time on the Roman Campagna' (1833, Leipzig Museum); 'Schreckenstein near Aussig'; 'Landscape in the Riesen Mountains'; etc. After working for some years as professor of landscape painting in the Dresden Academy, he retired in 1876 on a pension provided by the German emperor. Consult: his autobiography, 'Lebenserinnerung eines deutschen Malers' (1885); Hoff, 'Adrian Ludwig Richter, Maler und Radierer' (1877).

**Richter, Gustav,** German painter: b. Berlin 31 Aug. 1823; d. there 3 April 1884. He studied under Eduard Holbein in Berlin and Cogniet at Paris, also studied at Rome. He was professor of the Berlin Academy and honorary member of the academies of Munich and Vienna. His first work to attract attention was the 'Raising of Jairus' Daughter' (1856). In 1864 he received the Grand Medal at Berlin, other medals have been conferred on him at Paris, Brussels, Vienna, and Philadelphia. His works are reproduced in vivid colored chromos. He painted many European celebrities, and of Americans a notable portrait of George Bancroft, the historian.

**Richter, Henry Joseph,** American Roman Catholic bishop: b. Neunkirchen, Oldenburg, Germany, 9 April 1838. He came to the United States in 1854, studied at Saint Xavier's College, New York, at Mount Saint Mary's Sem-

inary, Cincinnati, and in 1860 entered the American College at Rome, where he was graduated in 1865. He was ordained in that year, was vice-president and professor of dogma, philosophy, and literature at Mount Saint Mary's Seminary in 1865-70, and in 1870-83 was rector at Saint Lawrence and chaplain of Mount Saint Vincent Academy. In 1883 he was consecrated first bishop of Grand Rapids.

**Richter, Jean Paul Friedrich**, generally known as **JEAN PAUL**, German author: b. Wandsiedel, near Baireuth, Bavaria, 21 March 1763; d. Baireuth 14 Nov. 1825. He was educated at Leipsic, and became a tutor and schoolmaster. In 1794 he turned from this to a general literary activity. The prince-primate Dalberg gave him in 1809 an annual pension of 1,000 florins, continued by the king of Bavaria. The fantastic quality of his genius was at first disconcerting, but gradually, says Carlyle, he became considered "not a strange crack-brained mixture of enthusiast and buffoon, but a man of infinite humor, sensibility, force, and penetration." His style is perhaps one of the most barbarous of mediums, and his books are quite without structure. His humor, however, is genuine, though frequently clumsy. He affected boldly to despise all literary proportion and technique, and is recompensed by having the bulk of his work pronounced difficult or unreadable. Yet scattered through his writings are the best of aphorisms and some of the most finely imagined passages in German literature. These may serve to account for the interest Carlyle and De Quincy took in him. Outside of Germany he has not been greatly read, though there are various English renderings of his volumes, such as 'Walt and Vult' by Lee (1846); 'Titan' by Brooks (1863); 'Flower, Fruit, and Thorn Pieces' by Ewing (1877); and 'Levana' by Wood (1887). His first novel, 'Die unsichtbare Loge' ('The Invisible Lodge') appeared in 1793. It was followed by 'Hesperus' (1794); 'Biographische Belustigungen unter der Gehirnschale einer Riesin' ('Biographical Recreations under the Skull of a Giantess,' 1796); 'Leben des Quintus Fixlein' (1796); 'Blumen, Frucht und Dornenstücke' ('Flower, Fruit, and Thorn Pieces,' 1796); 'Der Jubelsenor' ('Parson in Jubilee,' 1797); 'Das Kampaner Thal' (1797); 'Titan' (1800); 'Flegeljahre' (translated by Carlyle, 'Wild Oats,' 1804). The two last are regarded as among his best productions. 'Das heimliche Klaglied der jetzigen Männer' appeared in 1801; 'Dr. Katzenberger's Badereise' (1809); 'Des Feldpredigers Schmelzle Reise nach Flätz' (1809); 'Leben Fibels' (1812); 'Der Komet, oder Nicolaus Markgraf' (1820-2); 'Die Vorschule der Aesthetik,' his first important philosophical work, appeared in 1804, followed by 'Levana, oder Erziehungslehre' (1807), a work on education. Further titles are: 'Friedenspredigt' (1808); 'Dämmerungen für Deutschland' (1809); 'Mars und Phöbus' Thronwechsel im Jahr 1814' (1814); 'Politische Fastenpredigten' (1817). A collection of his works, 'Sämmtliche Werke,' edited by him before his death, was published in 65 volumes (1826-38). 'Der Papierdrache,' his last work, was published in 1845. Consult Spazier, 'Jean Paul Friedrich Richter, ein biographisches Commentar zu dessen Werken' (1833); Carlyle's two essays on Richter; Förster, 'Derkwürdigkeiten

aus dem Leben Richters' (1863); and Nerrlich, 'Jean Paul und seine Zeitgenossen' (1889).

**Richthofen, rīst'hōf-ēn, Ferdinand, BARON VON**, German geologist: b. Karlsruhe 5 May 1833; d. Berlin 7 Oct. 1905. He was educated at the universities of Breslau and Berlin; and went to Austria in 1856 to study the geology of Tyrol, Siebenbürgen and northern Hungary. In 1860 he joined a Prussian expedition to the East and spent 12 years in China, Japan, Siam, Java, the Philippine Islands, Formosa, California, and Nevada. Returning to Europe in 1872 he accepted professorships at Bonn, Leipsic, and Berlin, successively. He published 'China, Ergebnisse eigener Reisen und darauf gegründeter Studien' (1877-83), and the following which have appeared in English: 'The Comstock Lode' (1865); 'Principles of the Natural System of Volcanic Rocks' (1867); 'Letters to the Shanghai Chamber of Commerce' (1869-72).

**Rich'wood**, Ohio, village in Union County; on the Erie railroad; 34 miles northwest of Columbus. It was settled in 1832, and its growth during the first 30 years was slow; since 1870 it has become the second town of the county in size and importance. It is the centre of an agricultural region; contains flour and planing mills, tile mills, and several large grain elevators, and has a considerable trade. It has a public high school with a school library. Pop. (1910) 1,782.

**Ricimer, rīst'mēr**, Roman general of the 5th century A.D.; d. 472. He was a barbarian, and received his training under Aëtius. For a long time he was "kingmaker" in the West. He deposed Avitus, and elevated successively Flavius Anitus (454-6), Majorianus (457-61), Libius Severus (461). After Libius' death, he himself ruled for a time as Patricius, until in 467 the danger of a Vandal invasion compelled an alliance of East and West, and the elevation of Procopius Anthemius. Ricimer later grew openly hostile to the monarch, whom he murdered 11 July 472 during a sack of Rome. He then made Olybrius emperor, and died soon afterward.

**Richards, rīk'ārdz, Marcus Samuel Cam**, English poet and naturalist: b. Exeter 28 April 1840. He was educated at Oxford, admitted a solicitor in 1862, and practised for many years in Bristol. In 1876 he took priest's orders in the English Church, was curate of Holy Trinity at Clifton, near Bristol, till 1889, and since that date has been vicar of Twigworth, Gloucestershire. Among his many published works, mainly in verse, are: 'Creation's Hope' (1890); 'Poems of Life and Death' (1895); 'Poems of a Naturalist' (1896); 'Musings and Melodies' (1902).

**Rickets**, a disease of children in which there is an affection of the general nutrition of the whole body, dependent chiefly upon improper feeding and want of fresh air and exercise. The disease commonly appears after the age of nine months and before that of two years, producing its most obvious effects on the growth of the bones. It is characterized by enlargement of the head, prominent forehead, projecting breast-bone, flattened ribs, big belly, and emaciated limbs, with great debility. The bones and spine of the back are variously distorted. Nature fre-

## RICKETSON — RIDDLE

quently restores the general health, and leaves the limbs in a state of distortion. In the treatment of rickets tonic medicines, the cold bath, etc., are beneficial. The child should be kept clean and dry, regularly exercised, and allowed to enjoy a pure bracing air, that of the seaside being specially beneficial. The food should be nutritious and easily digestible.

**Ricketson**, rik'et-són, Walton, American sculptor: b. New Bedford, Mass., 27 May 1839. He took up sculpture in 1870, and has since produced portrait busts of Bronson Alcott, Louisa M. Alcott, Thoreau, and George William Curtis, besides intaglios and bas-reliefs.

**Ricketts**, rik'ets, James Brewerton, American military officer: b. New York 21 June 1817; d. Washington, D. C., 22 Sept. 1887. He was graduated from West Point in 1839, served in the Mexican War, where he was engaged at Monterey and at Buena Vista, was promoted captain in 1853, and fought in the Seminole War in Florida. He afterward served on the Texas frontier until the outbreak of the Civil War, when he assisted in the defense of Washington and the capture of Alexandria. He participated in the first battle of Bull Run, and was brevetted lieutenant-colonel and brigadier-general of volunteers. He commanded a division at Chantilly, South Mountain, and Antietam, in 1863 he received promotion as major of artillery in the regular army, was in command of a division in the Richmond campaign, and fought in the engagements from the battles of the Wilderness to the investment of Petersburg. In 1864 he served under Sheridan in the pursuit of Early's army. He was brevetted major-general in the regular army in 1865, and in 1865-6 was in command of a district in Virginia. He was mustered out of the volunteer service in 1866, and in 1867 retired from active duty.

**Rickman**, rik'man, Thomas, English architect: b. Maidenhead, Berkshire, 1776; d. March 1841. He developed a taste for architectural drawing, and having sent in a design for a church that proved successful in a government competition, he settled at Birmingham as an architect. He built a number of Gothic churches and chapels in Birmingham; Hampton, Lucy, Bristol, Preston, Carlisle, etc., many country houses, and the new buildings of St. John's College, Cambridge. He is the author of 'Attempt to Discriminate the Styles of Architecture in England from the Conquest to the Reformation' (1817).

**Rico**, ré'kô, Colo., town, county-seat of Dolores County; on the Rio Grande Southern railroad; 140 miles southwest of Leadville. The first settlement was made in 1867 and a new settlement in 1877, both by mining prospectors; the town was incorporated in 1879, and became the county-seat on the organization of the county in 1881. It is in a region rich in gold, silver, copper, and iron, and the chief industry is the mining and milling of these ores. The town contains a bank with a capital of \$50,000; and the county court-house. It has a graded public school. The government is vested in a mayor, elected annually, and a council of six members, three elected each year. Population in 1910, 1,208.

GEORGE H. HUTT,  
Editor 'Rico News.'

**Ricord**, ré-kôr, Philippe, French physician: b. Baltimore, Md., 10 Dec. 1800; d. Paris, France, 22 Oct. 1889. He went to Paris in 1820, where he was granted his medical degree in 1826, practised in the provinces for two years, and on his return to Paris passed the Concours examination, and was appointed a surgeon at the Pitié Hospital. In 1831 his lectures in surgery secured his appointment as surgeon-in-chief at Hôpital des Veneriens du Midi, an office he continued to fill until 1860, when he resigned and engaged in private practice. In 1862 he was appointed physician in ordinary to Prince Napoleon, and in 1869 consulting surgeon to Napoleon III. He was made commander of the Legion of Honor in 1860, and for his services in the ambulance corps during the siege of Paris was made grand-officer of the Legion in 1871. He was the author of various valuable surgical treatises, and invented several surgical instruments.

**Riddell**, rid-dél' or rid'l, Charlotte Eliza Lawson Cowan, English novelist: b. 30 Sept. 1832. She was the daughter of a high sheriff of Carrickfergus, Ireland, and was married to J. H. Riddell of Staffordshire in 1857. Her earliest novel was 'The Ruling Passion' (1858); and among her many later fictions are 'George Geith,' one of her best known works (1865); 'Maxwell Drewitt' (1865); 'Far Above Rubies' (1868); 'The Senior Partner' (1881); 'The Head of the Firm' (1892); 'A Rich Man's Daughter' (1897). Her stories are well constructed, wholesome tales, and have been popular in this country as well as in England.

**Riddell**, Mrs. J. H. See RIDDELL, CHARLOTTE ELIZA LAWSON COWAN.

**Riddle**, rid'l, Matthew Brown, American theologian: b. Pittsburg, Pa., 17 Oct. 1836. He was graduated from Jefferson College, Pa., in 1852, and from the New Brunswick Theological Seminary in 1859. He was adjunct professor of Greek at Jefferson College in 1857-8, was pastor of the Dutch Reformed Church, Hoboken, N. J., 1861-5, and of the Second Reformed Church, Newark, N. J., 1865-9. In 1871-87 he occupied the chair of New Testament exegesis at Hartford Theological Seminary, Conn., and since 1887 has filled that chair at the Western Theological Seminary, Allegheny, Pa. He was a member of the American Committee for New Testament revision, an editor of the Standard edition of the Revised Version, and was a revising editor on the Standard American Revised Version of the New Testament (1901). He was one of the editors of Lange's 'Commentary'; 'International Commentary'; 'International Revision Commentary'; and Myer's 'Commentary'; edited Robinson's 'Greek Harmony of the Gospels' (1885); Vols. VII., VIII., 'Ante-Nicene Fathers' and Vols. VI., X., 'Nicene and Post-Nicene Fathers' (1886).

**Riddle**, any sentence or composition with a double or veiled meaning, which is propounded with a view to the discovery of that meaning, which is designedly obscured by the terms of the riddle. A riddle may either have an apparent sense which serves as a disguise to the real one, or it may be in the form of a question, the terms of which do not directly indicate the na-

## RIDEAU — RIDGEWOOD

ture of the answer required. Riddles naturally divide themselves into two classes: plays upon words, which are otherwise called conundrums; and allegorical or fanciful descriptions of or allusions to the subject on which the riddle is founded. The latter is called an enigma. It is the more ancient and serious form of the riddle. Enigmas, or dark sayings, were frequently used by the ancients to disguise important truths, which it was not deemed safe or advisable that every one should know. Kings sent enigmas to each other, ambassadors delivered their messages in this form, and the oracles of the gods were frequently conveyed in the form of an enigma. In modern times serious enigmas have been elaborated in prose and verse, particularly the latter, in all civilized languages. They are in general mere elaborate trifling, and are commonly as dull as they deserve to be.

Among the most celebrated examples of ancient riddles is that propounded by the Sphinx, and answered by Oedipus. What animal is that which goes on four feet in the morning, on two at midday, and on three in the evening? The answer is Man, because he goes on all fours as a child, on two feet as a young man, and with a staff in old age. The punning variety of riddle, though sometimes indulged in by the Greeks and Romans, is comparatively of modern growth. It is a great favorite in festive gatherings of juveniles. Sometimes strings of puns are linked together with considerable ingenuity in the more complex riddles of this description, as in the following instance: What wind does a hungry sailor like best? One that blows fowl and chops, and then comes in little puffs. The earliest collection of riddles known to have been published is entitled 'Demands Joyous,' printed in 1511. The first French collection was published in Paris by Gille Beys in 1582. See also ENIGMA.

**Rideau** (ré-dô') Canal, a Canadian canal constructed between Kingston on Lake Ontario and Ottawa as a through waterway by means of the River Ottawa to Montreal, the Saint Lawrence route being interrupted by rapids. Canals have since been built along the Saint Lawrence to avoid these, and the Rideau is now little used.

**Riding**, rid'ing, William Henry, American editor: b. Liverpool, England, 17 Feb. 1853. He came to the United States and lived in Chicago until 1870, after which he was engaged in journalism in various American cities. Since 1881 he has been associate editor of the 'Youth's Companion,' and in 1887-99 was associate editor of the 'North American Review.' He has published: 'Scenery of Pacific Railways' (1878); 'Thackeray's London' (1885); 'In the Land of Lorna Doone' (1895); 'At Hawarden with Mr. Gladstone' (1896); 'How Tyson Came Home' (1904); etc.

**Riders**, in national or state legislation, the additional provisions of a bill under the consideration of a legislative assembly, having little connection with the subject-matter of the bill. Sometimes riders are attached to important bills, in order to gain the chance of passage, since by themselves they are likely to incur an executive veto, but as a part or proviso of an important bill they are absorbed in the main subject, and so dodge the "veto" and the "table." It has been proposed frequently that the Constitution of the United States be so amended that the

President could veto single objectionable items without affecting the main purpose of bills.

**Ridge**, ridj, Major, Cherokee chief: b. Highwassee, present State of Georgia, about 1771; d. Cherokee reservation 22 June 1839. He became a councillor and one of the leaders of the Cherokee nation. He favored the deportation of the Cherokees from the Georgia reservation to one westward of the Mississippi, and was murdered, presumably, by some of the opposing party.

**Ridge**, William Pett, English novelist: b. Chatham, Kent. He was educated at the Birbeck Institute in London. He began to write in 1890, and among his published works are: 'The Second Opportunity of Mr. Staplehurst' (1896); 'A Son of the State' (1889); 'A Breaker of Laws' (1900); 'Outside the Radius' (1900); 'Lost Property' (1902).

**Ridgefield**, ridj'fild, Conn., town in Fairfield County, on the New York, New Haven & Hartford railroad; about 60 miles northwest of New York, and 13 miles north by west of Norwalk. It is in an agricultural region, and is a favorite resort for residents of New York. The chief industries which contribute to the prosperity of the town are farming, dairying, the grinding of feldspar, and the manufacturing of ice-cutting tools. The most prominent public building is the public library, presented to the town by James Morris of New York, in memory of his wife, Elizabeth W. Morris. There are four churches, good public schools, and one private school. The National Bank has \$25,000 capital; the savings bank has \$502,268.52 deposits. The government is administered by a board consisting of a warden and burgesses, six members, elected annually in May. Pop. (1900) 2,606; (1910) 3,118. W. A. WHITE,

Editor 'Ridgefield Press.'

**Ridge'town**, Canada, town in the County of Elgin, Province of Ontario; on the Michigan Central railroad; about eight miles from Lake Erie and 65 miles east of Windsor. It is in an agricultural region, and has some manufacturing interests.

**Ridgeville**, ridj'vil, Ind., town in Randolph County; on the Mississinewa River, and on the Pittsburg, C. & St. L. and the Grand Rapids & Indiana R.R.'s.; about 60 miles south of Fort Wayne, and 90 miles northeast of Indianapolis. It is in a fertile agricultural region, and is the trade centre for the northern part of the county. It has several industries connected chiefly with farm products and stock raising. It has good public schools, several private schools, and a public library. Pop. (1910) 1,178.

**Ridge'wood**, N. J., village in Bergen County; on the Erie railroad; about 22 miles north of New York. The railroad divides the village into eastern and western sections. The village is in a residential locality; the western side is built up with fine residences, most of them the homes of men doing business in the city. The eastern section of the village spreads out into the Paramus Valley, through which flows the Saddle River. In this part are substantial dwellings with extensive grounds. There are no manufactories. The business blocks and fraternal society buildings are mostly of limestone and pressed brick.

There are nine churches, public schools, and one private school for boys. Located here is the House of Divine Providence for Incurable Patients, in charge of Sisters of Charity. The water supply is obtained from artesian wells. The roads in the vicinity are excellent, and the scenery in general, together with the numerous groves and small streams, make it a most charming locality. In the vicinity are many points of historic interest, their histories dating back to pre-Revolutionary days. Pop. (1890) 1,047; (1900) 2,685; (1910) 5,416.

**Ridgway, ridj'wā, Robert**, American naturalist: b. Mount Carmel, Ill., 2 July 1830. He was zoologist to the United States geological exploration of the fortieth parallel under Clarence King in 1867-9, and since 1880 has been curator of the division of birds in the National Museum at Washington. He was one of the founders in 1883 of the American Ornithologists' Union, of which he later became president. He served as a member of the committee at the first International Ornithological Congress at Vienna in 1885, and of that at Budapest in 1891. He is author of: 'A Nomenclature of Colors for Naturalists' (1896); 'Manual of North American Birds' (1887); 'Birds of North and Middle America' (1901-2); etc.

**Ridgway, Pa.**, borough, capital of Elk County; on the Clarion River, and on the Buffalo, R. & P. and the Pennsylvania R.R.'s; about 150 miles northeast of Pittsburgh and 115 miles southeast of Erie. It is in a region devoted mainly to lumbering and agriculture. The chief industrial establishments are lumber mills, sash, door, and blind factories, flour and grist mills, machine shops, engine and boiler works, and dry kilns. There are other manufactories whose products are mining materials, proprietary medicines, and tobacco products. The educational institutions are public and parish elementary schools, a public library, and a private business school. Pop. (1910) 5,408.

**Riding and Driving.** See HORSES, RIDING AND DRIVING.

**Ridley, rid'li, Nicholas**, English ecclesiastic and martyr: b. about 1500; d. Oxford 16 Oct. 1555. He was graduated from Cambridge in 1521-2, later studied at the Sorbonne, Paris, and at the University of Louvain. Returning to Cambridge as proctor to the university, as such he advocated the claims of King Henry VIII. to the supreme ecclesiastical jurisdiction in the realm. Through the patronage of Archbishop Cranmer he became one of the king's chaplains; in 1540 he became master of Pembroke Hall, in 1541 canon of Canterbury, and in 1545 an additional canonry of Westminster was conferred upon him. In 1547 he was elevated to the see of Rochester. In 1550, on the deprivation of Bonner, Ridley was made bishop of London, and distinguished himself by his tempered zeal in favor of Protestantism, and especially by his liberality and kindness toward the family of his predecessor. In 1553 in a sermon before Edward VI. he made an appeal for the destitute London poor, and as a result of subsequent conferences the king and corporation of London determined to build Christ's Hospital, St. Thomas' Hospital, and Bethlehem Hospital. On the death of Edward he was induced to listen to those who

attempted to secure the Protestant ascendancy by placing the Lady Jane Grey upon the throne. The defeat of this scheme, the active part he had taken in the establishment in the new discipline and the construction of the liturgy, together with his connection with Cranmer, marked Ridley out as one of the most prominent opponents of Queen Mary. He was arrested and sent to the Tower 20 July 1553. In the spring of 1554 he was removed to Oxford, and being brought before the royal commissioners and refusing to recant he was excommunicated. His further trial progressed slowly. The next year parliament passed penal laws against heretics and under these he was summoned to trial. His condemnation followed upon his admitting the truth of the principal charges against him, and he was burnt at the stake in company with Hugh Latimer.

**Rid'path, John Clark**, American educator and historian: b. Putnam County, Indiana, 26 April 1840; d. New York 1 Aug. 1900. He was graduated from Asbury University, Indiana, in 1863, and in 1864 was appointed principal of the academy at Thornton, Ind. In 1866 he was superintendent of public instruction for Lawrenceburg, Ind., and in 1867-9 professor of languages at Baker University, Baldwin City, Kan. In 1869 he was appointed to the chair of English at Asbury, and in 1879 became vice-president of the university. The endowment of \$2,000,000 bestowed upon the university by Mr. De Pauw, was secured largely through Ridpath's efforts, and under his management it received its new name of De Pauw. After his resignation from the university he devoted himself to literature. He was one of the editors of the 'People's Cyclopaedia' (1881), and published 'Academic History of the United States' (1874-5); 'Popular History of the United States' (1877); 'Life of James A. Garfield' (1882); 'Cyclopaedia of Universal History' (1880-4); 'Great Races of Mankind' (1893); 'Life and Times of Gladstone' (1898); 'History of the United States' (1900); etc.

**Riedesel, rê'dê-zêl, Frederica Charlotte Louisa (VON MASSOW)**: b. Brandenburg 1746; d. Berlin 29 March 1808. She was the wife of Baron Riedesel (q.v.), and accompanied her husband to America. After Burgoyne's surrender she resided for a year at Cambridge, Mass., where a street has since been named in her honor; and later at Charlottesville, Va. She wrote graphic descriptions of the campaign and subsequent events, published after her death by her son-in-law, Count von Reuss, and translated inadequately into English in 1827 ('Letters and Memoirs Relating to the War of American Independence, and the Capture of the British Troops at Saratoga'), and worthily by W. L. Stone in 1867 ('Letters and Journals Relating to the War of the American Revolution').

**Riedesel, Friedrich Adolph, FRIEDRICH VON EISENBACH**, German soldier: b. Lauterbach, Rhine Hesse, 3 June 1738; d. Brunswick 6 Jan. 1800. He studied at the Marburg law school, but before the completion of his course enlisted in a regiment of Hessian infantry as vice-ensign, and soon afterward went to England with his regiment, which had been made part of the British army, and was billeted on a town near London. There he became fairly pro-

## RIEL—RIEL'S REBELLION

ficient in English. On the outbreak of the Seven Years' war in 1756, the regiment was summoned to Germany, and Riedesel was assigned to the immediate staff of Duke Ferdinand of Brunswick. Shortly after the outbreak of the American Revolution, England negotiated with several of the petty sovereigns of Germany for some 20,000 troops. Of these about 4,000 were from Brunswick. Riedesel was promoted major-general and placed in command of the Brunswick contingent, and on 1 June 1776 he reached Quebec. A thorough disciplinarian, he practised his troops in the American mode of fighting, particularly in rapidity of firing, in which the Continentals were much more efficient. He accompanied Burgoyne (q.v.) on the ill-fated expedition of 1777, distinguished himself at Ti-conderoga, and at Hubbardton brought up reinforcements and dispersed the Americans. At Freeman's Farm 19 Sept. 1777, he saved the British from rout by arriving with his Brunswickers; and, after the action on 7 October, had his counsels prevailed, Burgoyne would probably have made a successful retreat to Canada. He was taken prisoner at Saratoga 17 October, exchanged in 1779, and in that year appointed to a command on Long Island. In 1783 he returned to Germany, in 1787 was promoted lieutenant-general, and in 1788 commanded the Brunswick portion of the army sent from Germany to Holland to assist the Stadtholder. From 1794 until his death he was commandant of the town of Brunswick. The 'Leben und Wirken des General-Lieutenants F. A. Riedesel, nebst vielen Original-Correspondenzen und historischen Aktenstücken,' by von Eelking, appeared in 1856. An abridged translation into English by W. L. Stone was published in 1868. It affords a most complete and accurate account of Burgoyne's expedition, as well as a clear view of contemporary affairs in Canada.

Riel, ré-él', Louis, Canadian insurgent: b. St. Boniface, Manitoba, 23 Oct. 1844; d. Regina, Northwest Territory, 16 Nov. 1885. He belonged to the Métis race of Franco-Indians, and as protégé of Archbishop Taché, was educated at the Jesuit College at Montreal. In 1869 he took part in the protest raised by the native tribes against the establishment of Canadian authority in the territories lately acquired from the Hudson Bay Company, and was elected president of a provisional government established at Fort Garry. The rebellion was suppressed the next year by a force under Sir Garnet Wolseley and Riel fled from the territory. In 1873 he was elected to the Dominion parliament for Provencher, but was not permitted to take his seat, and after two subsequent re-elections a warrant of outlawry was issued against him and he was sentenced in 1875 to five years' banishment with forfeiture of political rights. In 1884-5 he headed a party of half-breeds in another insurrection, which was soon suppressed. Riel was taken prisoner, convicted of treason, and executed. See RIEL'S REBELLION.

Riel's Rebellion, or the Northwest Rebellion, was an outbreak of the half-breeds and Indians of the valley of the Saskatchewan, in the spring of 1885, promptly suppressed by the Canadian militia. For some time past discontent had been rife among the half-breeds, or métis, of that district, who feared that the surveying of the

country by the Dominion government and the government sales of land to incoming settlers would dispossess them of their homesteads. In June 1884 Louis Riel, the half-breed leader of the abortive outbreak of 1869-70, returned by invitation from Montana and put himself at the head of the movement. At a gathering at Saint Laurent, on the Saskatchewan, September 1884, a "Bill of Rights" was adopted asking that the half-breeds should receive the same grant of 240 acres per capita that had already been given (1870) to their kinsmen in the province of Manitoba. With this demand were coupled more extravagant pretensions to further reservations of land and grants of money. Various petitions had already been sent to the Dominion government in behalf of the half-breed claims. A commission had been appointed to consider them, but the whole matter aroused so little public attention in Canada that the news of the actual revolt in March 1885 came with alarming suddenness. On the 17th of that month the métis formed a provincial government, with Louis Riel (q.v.) as president, Gabriel Dumont as adjutant-general, and a numerous council. All obtainable stores were seized, supplies on the way to Prince Albert intercepted, and the telegraph wires cut. At the same time every effort was made to arouse the Indians of the Saskatchewan district, detachments of whom, under Beaudy and One-Arrow, at once joined the rebels. The only forces immediately available to cope with the outbreak were about 500 mounted police, scattered in small detachments over the Northwest Territory, of whom some 200 men of all ranks were distributed between Prince Albert, Fort Carlton, Battleford, and Fort Pitt. The rebels demanded the surrender of Fort Carlton, a mounted police post on the North Saskatchewan, 40 miles above Prince Albert, held by Major Crozier with a handful of men. Crozier refused, and succeeded in communicating with Prince Albert, and obtaining a reinforcement of 40 volunteers. With the help of these he attempted (26 March) to secure the stores from Duck Lake, a post a few miles distant. Here occurred the first bloodshed of the rising. The rebels attacked Crozier near Duck Lake, and forced him to retire to Carlton with a loss of 12 killed and 12 wounded. The mounted police burned the fort at Carlton and retired to Prince Albert. The news of the fight at Duck Lake occasioned intense excitement throughout Canada. Immediate steps were taken to despatch an adequate force of militia to the northwest. General Sir Frederick Middleton, the commander-in-chief, was already on his way. On the 28th of March there was a general call to arms of the militia forces, picked troops from the different regiments being at once forwarded to the front. Various corps of scouts, rangers, cavalry, etc., were specially organized. Eighteen hundred troops started from Ontario and Quebec within six days of the call to arms, and within a month 3,000 men had been transported to the northwest and 1,500 raised in Manitoba and the territories. The area of operations was the valley of the Saskatchewan River, whose north branch runs from west to east through the district of the same name at a distance of about 200 miles north of the Canadian Pacific Railroad and roughly parallel with its course. On this river were the important posts of Prince Albert, Battleford, sit-

meted about 160 miles farther up the river, and Fort Pitt, also on the river, 120 miles northwest of Battleford. The main body of rebels had established themselves at Batoche, on the South Saskatchewan, a river flowing from the southwest to meet its confluent on a long V-shaped angle. Mustering his forces at Qu'Appelle and Swift Current, Middleton resolved to strike into the rebel territory in two columns. The main column, under Middleton, was to move northward on Clark's Crossing, a ferry station on the Saskatchewan about 40 miles by trail from Batoche. A second, under Lieutenant Colonel Otter, was to march from Swift Current (140 miles west of Qu'Appelle) to the relief of Battleford. A third force, gathered at Calgary, was to descend the route of the North Saskatchewan from Edmonton, thus reaching Fort Pitt. Meantime the position of affairs appeared extremely critical. Some 500 Indians in the neighborhood of Battleford had risen under Poundmaker, a Cree chief, laid siege to the stockade fort in which the whites had taken refuge, and plundered the stores of the town. Near Fort Pitt the Indians had also risen under Big Bear, and at Frog Lake, a post about 30 miles distant, on Good Friday (3 April), they plundered the stores and shot down nine persons in cold blood. The news of the massacre spread terror throughout the unprotected valley of the upper river, the settlers fleeing toward Edmonton. Many of the deserted houses were looted and burned. The advance was carried out with admirable success. The main column, the Royal Grenadiers, A Battery and other troops, traversing in forced marches 177 miles of prairie, struck the South Saskatchewan at Clark's Crossing. Advancing northwards down the river, they came upon the rebels strongly posted in a wooded ravine called Fish Creek, in which they had constructed rifle pits. A sanguinary contest ensued (23 April). The rebels, led by Gabriel Dumont, defended themselves stubbornly, but were ultimately dislodged. The loss of the militia was 10 killed and 40 wounded. The second column, under Otter, consisting chiefly of Queen's Own men, left Swift Current 13 April, and after a march of 202 miles successfully relieved the beleaguered fort at Battleford. From there Colonel Otter determined to strike at Poundmaker's reserve, against which he moved on 1 May, with a force of 325 men and three guns. They came upon the Indians in force at Cut Knife Hill, and after a severe engagement were compelled to retire on Battleford, with a loss of 8 killed and 14 wounded. At the same time General Strange, with the third division, marched from Calgary to Edmonton (2 May), and thence directed his forces against Big Bear. Meanwhile General Middleton decided to move forward against the main body of the half-breeds at Batoche. The advanced season rendered possible the navigation of the South Saskatchewan, down which the steamer Northcote, with supplies and munitions, was despatched to join Middleton's column. Batoche was invested by the militia on 9 May, and a four days' fight ensued. The rebels were entrenched in rifle pits along the banks of the river. During the first three days the fighting was desultory, Middleton using his artillery and throwing up earthworks in order to exhaust the ammunition of the half-breeds without unduly exposing his men. The Northcote, that was to

have aided in the attack, steamed down the river under a hot fire on the 9th, but its steering gear being disabled, it drifted past Batoche. On the fourth day a general charge of the militia resulted in a complete victory. The rifle pits and the village of Batoche were taken by storm and Riel and many of his council captured. Dumont escaped to the United States. The loss of the Canadian forces in the four days was 8 killed and 46 wounded; that of the rebels, 51 killed and 173 wounded. With the storming of Batoche the rebellion was virtually at an end. Poundmaker capitulated, and Big Bear fleeing to the north, though offering fight at Frenchman's Butte and Loon Lake, was ultimately captured (2 July). Riel was taken to Regina, where he was tried for treason-felony (July 1885). His counsel attempted to defend him on the ground of insanity, but the plea was unavailing, and he was sentenced to be hanged. Numerous petitions were sent from French Canada in favor of commutation of his sentence, with equally urgent petitions to the contrary from various parts of the Dominion. He was hanged at Regina 16 Nov. 1885, meeting his death with great fortitude. Eight Indians were shortly afterwards hanged at Battleford for complicity in the murders at Frog Lake, Fort Pitt and other places. Poundmaker, sentenced to three years' imprisonment, died in the Manitoba penitentiary. For further information consult the 'Official Report on the Suppression of the Rebellion,' Ottawa, 1886; 'Dominion Annual Register' (1885); 'Reminiscences Lieut.-Col. Bolton' (1886). STEPHEN LEACOCK,  
McGill University.

Rienzi, rē-nē-zē, Cola di, Roman popular leader: b. about 1313; d. 8 Oct. 1354. The son of an innkeeper, he became imbued with a passionate desire to re-establish the glory of ancient Rome on the ruins of the oligarchy under whose rule the people suffered. In 1343 he went to the Pope at Avignon, as the representative of the Roman people, and entreated him to return to Rome and end the misrule of the nobles. The Pope made Rienzi apostolic notary, and the latter returned to Rome, where he began the organization of a widespread movement for the overthrow of the aristocracy. On 20 May 1347, Rienzi summoned an assembly of the people at the Capitol, and there proposed a new constitution for the state, providing for the arming of the people and the garrisoning of the walls by them, the reform of justice and the equitable distributing of taxes. He became head of the new republic with the title of Tribune of the People, and by means of the popular levies forced the nobles to leave the city. Rienzi's plans included not merely the restoration of the municipal liberties of Rome, but the re-establishment of the ancient Roman state, and to that end he invited the Italian cities to send representatives to Rome for the consideration of the welfare of Italy. Though few cities responded, Rienzi, carried away by power and his own eloquence, caused himself to be crowned tribune 15 August, and bestowed the Roman citizenship on all inhabitants of Italy. The Pope's hostility, however, was aroused by Rienzi's vainglorious attempt to act as arbitrator in the dispute for the imperial throne that was then in progress, and he stirred up the Roman nobles against Rienzi. The nobles were defeated, but, Rienzi, dazzled by success, began to play the tyrant, and a second insurrection compelled him to flee the city (13

December). Later he went to Bohemia to secure the aid of Emperor Charles II. for the execution of his plans. The emperor handed Rienzi over to Pope Innocent VI., who, however, recognized how useful the tribune might be to him in crushing the Roman nobility and therefore sent him to Rome with Cardinal Alborno in 1354. Rienzi's popularity was still great and he easily regained power, once more, however, he fell a victim to excess, perpetrated acts of outrage and oppression, and aroused the hatred of the people. An insurrection, stirred up by the nobles of the house of Colonna and Sarelli, broke out on 8 Oct. 1354. The mob stormed the Capitol, and Rienzi, seized as he was escaping in disguise, was murdered, and his body dragged through the streets. The career of Rienzi is the subject of one of Bulwer-Lytton's novels, 'Rienzi' (1835) and of Wagner's opera, 'Rienzi,' first produced at Dresden on Oct. 1842. Consult: Pappencordt, 'Cola di Rienzo und seine Zeit' (1841); Auriac, 'Etude historique sur Nicolo Rienzo' (1888); Rodocanachi, 'Cola di Rienzi' (1888).

**Rienzi, The Last of the Roman Tribunes,** a historical romance by Sir Edward Bulwer-Lytton, published in 1835. It is founded on the career of Cola di Rienzi (q.v.). Bulwer was so impressed with the heroism and force of character of his hero, that at first he meditated writing his biography, instead of a romance founded on his life. The story adheres very closely to the historical facts. Many of the situations and scenes are very strong. The treatment is epic rather than dramatic; and the splendid yet comfortless civilization of the Middle Ages, so picturesque and so squalid, so ecstatic and so base, is vividly delineated. Rienzi is also the subject of a once popular tragedy by Mary Russell Mitford, first published in 1828.

**Riesengebirge, rē'zē-gē-bēr'gē** (the Giants' Mountains), part of the Sudetic chain, separating Silesia from Bohemia and Moravia, till it joins the Carpathians. It contains the loftiest mountains of the north or central parts of Germany. Some of the principal summits are Schneekoppe, 5,257 feet high; the Borenberg and the Grand Rad, each 5,156 feet high.

**Riet-bok, rēt'bōk**, the Dutch name of a South African species of antelope, *Antelope* (or *Tragelaphus*) *arundinaceus*. It is nearly five feet in length and about three feet high at the shoulder; the horns, about a foot long, are boldly annulated at the base. In color it is of a dull ashy gray, sometimes tinged with red on the upper parts and silvery-gray beneath. As its name (*riet-bok*, reed-buck) implies, it is found mostly among reeds or coarse long grass.

**Rif**, a name given to the coast districts of northern Morocco extending from Ceuta to the western frontier of Algiers, and forming a line of steep cliffs with few harbors. Its Berber inhabitants were formerly much addicted to piracy, and are still noted for smuggling.

**Riffe.** See SMALL ARMS.

**Rifleman, or Rifle Bird**, an Australian forest-bird (*Phlorhis paradisus*), closely related to the birds of paradise and so called because its colors and ornaments reminded the colonists of the old uniform of the British Rifle Brigade. The male is regarded as more splen-

did in plumage than any other Australian bird. The upper parts are velvety black, tinged with purple; the under parts velvety black, diversified with olive-green. The crown of the head and the throat are covered with innumerable little specks of emerald green of most brilliant lustre. The tail is black, the two central feathers rich metallic green. The female, as is often the case, is much duller colored than her mate. They obtain their insect food largely from beneath the loose bark of trees, about which they scramble like woodpeckers. Consult Newton, 'Dictionary of Birds' (1893-6).

**Riffing.** See ORDNANCE.

**Rig Veda, rīg vā'dā**, the oldest of the four Vedas, and therefore the oldest literary monument of the Indo-European races. The term Veda is the ancient Hindu Sanskrit word for knowledge, and the Vedas compose the great body of sacred scripture of the older Hindus, written in an ancient form of Sanskrit. The precise time of composition of the Vedas can not be determined, but it is probable that the Rig Veda was in course of composition as early as 1200 B.C., and some authorities contend that some of the verses must have been composed as early as 1500 B.C., the latest date of composition given for any of the verses being 600 B.C. It is known that the Rig Veda was composed by many different generations, and Max Müller believes that for a long period after its composition it was transmitted orally from one to another, and that it was not set down in writing until a much later date, since it contains no allusion to writing or writing materials. Of the four Vedas the Rig Veda is by far the most important, not only on account of its greater antiquity but also because of the information which it contains. The most authoritative writers state that the sacred hymns of the Rig Veda are repeated in a modified form in the Sama Veda, or chants, and in another form in the Yajur Veda, or ritual, while the fourth and latest of the Vedas, the inferior Atharva Veda, shows great modifications from the hymns of the Rig Veda, due to the introduction of superstitions, magic chants and vulgar charms. The hymns of the Rig Veda, in common with those of the three succeeding ones, are of four classes; the first and most important are the mantras, or sacred utterances, usually in metrical form; the next are the Brahmanas, or explanatory inspired utterances, being the oldest Indo-European bodies of prose; last come the Sutras, or rules of the sacrifice. The Rig Veda consists of 1,017 hymns or short lyric poems, with 10,580 verses. It is written in ten books, of which books ii.-viii. contain each the record of a single family or clan; book i., 15 collections, each attributed to a different poet-sage; book ix. glorifies the sacred drink "Soma," and book x. contains hymns supposed to have been composed by many different authors. The religion was nature worship, the chief objects of adoration being Agni, the god of fire, and Indra or Jupiter Pluvius, the cloud-compeller. The Hindu Triad had not yet arisen. The Rig Veda does not recognize the institution of caste. Beef was eaten. Women held a high position, and some of the hymns were composed by them. The rite of suttee was unknown; the conquest of Indra had

only begun, and the Ganges, incidentally mentioned, had not become a sacred stream. "The home of the Rig Veda," says Prof. Hopkins, of Yale University, "has been located in almost as many places as Paradise. Now it is by the Caspian Sea, now it is in Kandahar, but the Punjab is the favorite place, and quite naturally; for the poets are familiar with the Punjab, sing of it, talk of crossing its rivers, and in many ways show that they occupied, in part at least, the country stretching from Peshawar to Delhi." (See *SAṆSKRIT LITERATURE; VEDA*.) Consult: 'India Old and New: The Rig Veda,' by E. W. Hopkins (New York 1901); 'The Religions of India,' by the same author (Boston, 1895); and the translation by Arrowsmith (Boston, 1886) of A. Kaegi's 'Rigveda.'

**Riga**, *rē'gā*, Russia, capital of Livonia on the Dwina, seven miles from the Gulf of Riga, an inlet of the Baltic, is one of the principal seaports of the empire and ranks in trade next to Saint Petersburg and Odessa. Of the four parts into which it is divided, the old town alone preserves the Hanseatic features. It is characterized by high storehouses and spacious granaries; market place; other squares, and busy, winding streets. The Saint Petersburg division of the town is the aristocratic quarter. The "Domkirche" (1204) contains one of the largest organs in the world. Saint Peter's Church has a tower 400 feet high. The Castle (1404-1515), built by Walter von Plettenberg, is a spacious building now occupied by the military authorities. Other places of more recent construction are: The Polytechnic, Exchange, municipal picture gallery, schools, gymnasiums and scientific and professional colleges, bonded warehouses and manufactories. At least half of the population is German, the German element predominating in the life of the city. There is an ever-increasing intellectual and commercial development. Riga is a great mart for timber from the vast White Forest, and the third city of Russia for exports, the chief of which are corn, hemp, oats, tallow, leather, tobacco, rugs, and feathers. Much of the interior trade is carried on by both rail and water communications.

**Riga**, Gulf of, Russia, an inlet on the east side of the Baltic Sea, 105 miles in length from north to south and about 60 in breadth. The islands of Osel, Dagö, Mohn, and Worms, lie across the entrance. The chief river which falls into the gulf is the Dwina; seven miles above its mouth is the important commercial seaport of Riga (q.v.), after which the gulf is named.

**Rigaud**, *rē-gō*, Hyacinthe, French painter: b. Perpignan 20 July 1659; d. Paris 27 Dec. 1743. He arrived at Paris in 1681 and, acting under the advice of Lebrun, began to study portrait painting, taking Van Dyck for his model. In 1700 he became a member of the Académie, of which he was elected Professor in 1710 and Rector in 1733. His portraits are all extraordinarily successful as likenesses, his heads are full of character, and the figures have all the studied nobleness in attitude characteristic of the times; while he paints the gay costumes of the court with remarkable truthfulness and brilliancy. Among his most notable works in

the Louvre are the large portraits of Louis XIV. and Bossuet, of which latter a replica or copy is to be found in the episcopal palace at Meaux.

**Rigdon**, Sidney, Mormon leader: b. Allegheny County, Pa., 19 Feb. 1793; d. Friendship, N. Y., 14 July 1876. He was employed in a printing office in Pittsburg in 1812 when a manuscript entitled 'The Manuscript Found, or the Book of Mormon' was offered for publication by Samuel Spaulding (q.v.). The work impressed Rigdon so much that he made a copy of the manuscript before it was returned to the author who died soon after. In 1819 Rigdon became a Baptist preacher and in 1829 made the acquaintance of Joseph Smith, with whom (according to a story denied by the Mormons) he published 'The Book of Mormon,' transforming it by the addition of various pious phrases from an innocent historical romance into a new bible intended as the foundation of a new sect. He accompanied Smith to the West, assisted in founding the Mormon Church and became one of its presidents. He was one of the originators of the "new revelation" authorizing polygamy, and in 1844 on the death of Smith aspired to the leadership. He refused to acknowledge the authority of Brigham Young, was excommunicated, and returned to the East where he lived quietly until his death.

**Rigg**, James Harrison, English Wesleyan clergyman and educator: b. Newcastle-on-Tyne 16 Jan. 1821. He was educated at Kingswood School and in 1845 entered the Wesleyan ministry. He was a member of the London school-board 1870-6; principal of the Westminster Training College 1868-1903; and a member of the Royal Commission on Education 1886-8. He edited the 'Quarterly Review' for 15 years and wrote: 'Principles of Wesleyan Methodism' (1850-1); 'The Churchmanship of John Wesley' (1868-78-86); 'Dr. Pusey: His Character and Life-work' (1883); 'Scenes and Studies in the Ministry of Our Lord' (1902); etc.

**Riggs**, *rigz*, Elihu, American missionary and linguist: b. New Providence, N. J., 10 Nov. 1810; d. Scutari, Turkey, 17 Jan. 1901. He was graduated from Amherst in 1829, from Andover Theological Seminary in 1832, was ordained to the ministry and sailed for Greece as a missionary in the same year. He continued his work in Greece from 1832-8, in Smyrna from 1838-53, and from that time was engaged in Turkey. He returned to the United States once, in 1856, for the purpose of publishing his Armenian Bible, and while waiting for the completion of the work taught Hebrew in Union Theological Seminary in 1857-8. The remainder of his life was spent in Turkey. He translated the Bible into Bulgarian, Armenian, and Turkish, and published: 'Manual of the Chaldean Language' (1832); 'Grammar of the Modern Armenian Language' (1847); 'Grammar of the Turkish Language as Written in the Armenian Character' (1856); 'Notes on Difficult Passages in the New Testament' (1889); etc.

**Riggs**, John Davis Seaton, American educator: b. Washington, Pa., 29 Jan. 1851. He was graduated from the University of Chicago in 1878, after engaging in business in Rockford,

Ill., in 1869-73. He was principal of the commercial department in Salt Lake Academy, Utah, in 1878-9, of the preparatory department in the old University of Chicago in 1879-86, and joint principal of University Academy, Chicago, in 1886-7. In 1887 he organized the Granville (now Doane) Academy of Denison University, Ohio, and was its principal until 1896, since when he has been president of Ottawa University, Kansas. He has published: 'In Latinum' (Cæsar) (1890); 'In Latinum' (Cicero) (1892); etc.

**Riggs, Kate Douglas (Smith) (Wiggin),** American author: b. Philadelphia 28 Sept. 1857. She was graduated at Abbott Academy (Andover, Mass.) in 1878; was the first to organize free kindergartens for the poor of the Pacific coast. She was married to G. C. Riggs in 1895, but continues to use the name "Kate Douglas Wiggin" as a literary signature. Her reputation as a humorist was made by the sketch 'The Birds' Christmas Carol' (1888), and has been well sustained by the cleverness in description and dialogue of her succeeding volumes, among them: 'The Story of Patsy' (1889); 'Timothy's Quest' (1890); 'Polly Oliver's Problem' (1893); 'Marm Lisa' (1896); 'Penelope's Progress' (1898); 'Penelope's Experiences in Ireland' (1901); and 'The Diary of a Goose Girl' (1902). She also edited the anthology 'Golden Numbers' (with N. A. Smith, 1902).

**Right, ré-gl.** See **RAIG.**

**Right** is a claim or a title to anything whatever that can be enforced, or a claim to act, possess, or enjoy anything, or the use thereof, or it may exist in the nature of a privilege or power. Right has also been legally defined "as that which one has a legal claim to do; legal power; authority, immunity granted by authority." A legal right is one which is protected by law, and the means of protection is the remedy. The existence of a legal right implies the existence of legal remedy, for one does not exist without the other.

**Right-handedness**, the property or condition of being right-handed. The propensity in man to use the right hand in preference to the left is generally attributed to the lack of perfect symmetry in the body. If the body could be folded over from a medial line so that each organ of the one side should lie exactly on a corresponding organ of the other, the bodily structure would be highly fitted, in a mechanical sense, for the equal use of either limb, and ambidextral individuals would be the rule. The centre of gravity in the body is a little to the right of such a medial line. This makes the right side the heavier. From a series of experiments the greater weight has been estimated at about 15 ounces. On this fact is founded the mechanical theory of right-handedness, the predominance of the right hand over the left; or, more generally, of the limbs of the right side over those of the left. The three-lobed right lung is more capacious and receives more air during an inspiration than the two-lobed left lung. The liver during inspiration swings toward the right side, shifting the centre of gravity farther to that side. In violent muscular exertion there is more air proportionally inhaled by the lung of the side which

sustains the exertion. Under exertion of the right side the larger lung is better filled than the smaller, and the centre of gravity is removed till it is found in a line passing through the right foot; so that the right leg and foot afford a steadier basis of support than the left would do under similar circumstances. Through the greater use of the right lower limb the right upper limb comes to be preferred. In the case of a light weight, slung on the arm, the equilibrium of the body is better maintained by carrying it on the left side. If the weight be a heavy one, borne on the left shoulder, the burden is really being supported very much by the right limb, owing to the natural curve of the body toward the right side, while sustaining the pressure.

In a very few cases left-handedness has been found to accompany transposition of the viscera. But cases of genuine left-handedness far exceed in number such instances of transposition. Ferrier's researches have proved that when we see with the right eye we see with the left side of the brain. Hereditary left-handedness may be due to the greater development of the right side of the brain. "It is practically certain," says Bastian, "that the great preponderance of right-handed movements in ordinary individuals must tend to produce a more complex organization of the left than the right hemisphere."

In the evolution of man right-handedness has probably been a late acquisition. The oldest discovered records of the human race, however, prove man to have been right-handed. Prehistoric weapons are those of right-handed individuals. Nearly all tools, etc., now in use are made for the right hand.

Right-handedness in man appears to be more persistent than the corresponding quality in lower animals. Naturalists, who observe that adult monkeys catch nuts more with the right hand, that the African elephant digs more with the right tusk, or that the Carolina parrot has a preferential claw for grasping, tell us that these habits are subject to exceptions more numerous than those of left-handedness in human beings.

**Right of Way**, the right to pass over a certain route or track in going from one place to another. Such a right is a public right of way if enjoyed by everybody; private if enjoyed by a certain person or description of persons (as the residents of a particular farm). Whenever there is a public right of way there is technically a highway, though the phrase is not used in connection with regularly-kept-up public roads, but generally with mere paths, tracts, or by-roads. The origin of a public right of way is generally said to be by dedication of it to the public by the owner of the soil.

**Right Whale**, the most important of the baleen whales. See **WHALE.**

**Rights of Man**, Declaration of the, a famous statement of the constitution and principles of civil society and government adopted by the French National Assembly in August, 1789. It suggested the title for Paine's defense of the French Revolution against Burke (1791-2); which was followed by Mary Wollstonecraft Godwin's 'Vindication of the Rights of Women.'

**Rights, Declaration and Bill of.** See BILL.

**Rigi, ré'gi, or Righi,** Switzerland, in the canton of Schwyz, an isolated mountain rising precipitously between Lakes Zug and Lucerne to a height of 5,905 feet. It may be approached by two railways of special type, and affords fine views, much visited by travelers. Ample accommodation is provided visitors in the way of hotels.

**Rig'or Mor'tia,** the rigidity of the body which comes on after death. It varies in the time of its appearance and also of its duration, sometimes setting in within a few minutes after the cessation of life, at other times not for many hours, and lasting in some cases but a very brief period, in others for several days. It is believed to be due to the coagulation of fluid substance in the muscular system which occurs after the withdrawal of nutrition from the tissues. Decomposition begins when relaxation of the body follows the passing off of the rigor.

**Riis, réa, Jacob Augustus,** American journalist, author, and social reformer: b. Ribe, Denmark, 3 May 1849. He came to the United States in 1869, and worked at different trades, until he became a reporter on the *New York Sun*. In this work he gained a thorough knowledge of the conditions in the slums of the city, and by his lectures and writings aroused interest in the reforms in the tenement house district, and became a leader in the reform movement. When Theodore Roosevelt was police commissioner, Riis' thorough knowledge of the city was of the greatest aid to him, and the commissioner was usually accompanied on his all-night tours of investigation by Riis. Under the leadership of the latter police station lodging houses were abolished, small parks in crowded districts opened, playgrounds equipped, and many tenement house evils done away with. He, however, has held but one official position in connection with this reform work, that of secretary of the New York Small Parks Commission in 1897. His first book was 'How the Other Half Lives,' published in 1890; other writings are 'The Children of the Poor' (1892); 'Nibsy's Christmas' (1893); 'Out of Mulberry Street' (1898); 'A Ten Years' War' (1900); 'The Making of an American,' an autobiography (1901); 'Battle with the Slums' (1902); 'Peril and Preservation of the Home' (1903); 'Theodore Roosevelt, the Citizen' (1904).

**Riley, ri'll, Charles Valentine,** American entomologist: b. London, England, 18 Sept. 1843; d. Washington, D. C., 14 Sept. 1895. He was educated at Dieppe and Bonn, and in 1860 came to the United States where he spent three years in studying practical agriculture. He then engaged in newspaper work and in 1864 went to the front in the Union army. In 1868 he was appointed State entomologist of Missouri and in that year assisted in founding the 'American Entomologist.' He was president of the Academy of Science at Saint Louis in 1876-7, chief of the United States entomological expedition under the Interior department in 1877, and in 1878 became United States entomologist in the department of agriculture, an office which he occupied until 1894 with the exception of 1879-80 when conducting the cot-

ton-worm investigation. In 1881 he was appointed curator of the National Museum and also became general secretary of the American Association for the Advancement of Science. He invented the 'cyclone' or eddy chamber in nozzles for spraying purposes and made numerous discoveries of methods to control insect pests. His publications include: 'Annual Reports on the Insects of Missouri' (9 vols. 1868-77); 'Annual Reports as Entomologist of the Department of Agriculture'; 'Potato Pests' (1876); 'Locust Plague in the United States' (1877); 'The San Jose Scale' (1895); etc.

**Riley, James Whitcomb,** American poet: b. Greenfield, Ind., 1833. After a public-school education, he became a sign-painter, and, when he deemed himself suitably proficient in art, turned strolling player, and composed songs and remodeled plays for the company of which he was a member. Still later, he was an editorial writer on the staff of the *Indianapolis Journal*. He began to contribute poems to Indiana papers in 1873. His verses in the Indiana dialect won for him instant success and the sobriquet of "The Hoosier Poet," by which he has been generally known. This work is quite unique in American literature. Riley is not, however, limited to this, but has written with melody and imagination in literary English. His public readings from his books became very popular, particularly in the Western States. The poem 'Leonainie,' written by him in imitation of Poe, proved one of the most successful of literary hoaxes. He found a wide public, and at the beginning of the 20th century was among the most familiarly known litterateurs of the United States. His earlier verse and his first book, 'The Old Swimmin' Hole' (1883), appeared over the signature of "Benjamin F. Johnson of Boone." Subsequent volumes are: 'Character Sketches and Poems' (1887); 'Afterwhiles' (1888); 'Pipes o' Pan at Zekesbury' (1889); 'Old-Fashioned Roses' (1891); 'Neighborly Poems' (1891); 'Armazindy' (1894); 'Rubaiyat of Doc Sifers' (1897); 'Home-Folks' (1900); and 'Out to Old Aunt Mary's' (1903).

**Riley, John,** English painter: b. Bishopsgate, London, 1646; d. there 1691. He did not rise into notice until the death of Sir Peter Lely and remained unsurpassed until the appearance of Sir Joshua Reynolds. He was an imitator of Van Dyck, and in both drawing and coloring must be reckoned one of the best portrait painters of his time. He painted the portrait of Charles II., who rather disconcerted the artist by exclaiming: "Is this like me? Then, odd's fish, I am an ugly fellow." He also painted James II. and his queen, William and Mary, Bishop Burnet, Dr. Busby of Westminster, and Lord Keeper North.

**Rimini, ré'mé-né** (ancient ARIMINUM), Italy, on the Adriatic, in the province of Forlì, celebrated for its mineral springs, the sea-bathing of the adjacent Porta Marina, and for the massive and elegant architecture of its chief buildings. Its fisheries are extensive. It was the seat of the celebrated Malatesta family. Pop. 50,000.

**Rim'mon.** See RAMMON.

**Rimouski, ré-moos-ké,** Canada, town in the county of Rimouski in the Province of

## RIMU — RINDERPEST

Quebec; on the right bank of the Saint Lawrence River, and on the Intercolonial railroad; 185 miles northeast of the city of Quebec. The principal occupations are lumbering and fishing; trout and salmon are abundant. It is a favorite summer resort on account of its cool climate and the opportunities for hunting and fishing. Communications by water are cut off about half the year, when the river is frozen. Pop. about 1,500.

**Rim'u, or Red Pine**, a New Zealand tree (*Decrydium cupressinum*) of the yew family. It grows to a height of 40 to 80 feet, and from 2 to 6 feet in diameter. The branches are pendulous and feathery, and the leaves slender and needle-like. Its brown wood is valued for general building purposes. The young branches make good spruce beer.

**Rin'derpest**, a general term covering various malignant diseases of neat cattle. Rinderpest proper is an acute infectious disease of cattle and sometimes of other ruminants, characterized by high fever, rapid pulse and cessation of milk-production during the first few days of the attack, followed by congestion and subsequently ulceration of the visible mucous membranes. The mortality is often as high as 90 per cent. This disease is on record since the 4th century. It was first known in eastern Russia and central Asia, whence it has periodically emerged, causing havoc in the herds of cattle and heavy losses to the various European nations. From Europe it spread to Egypt. It appeared in Somaliland in 1889 and spread southward, reaching the Zambesi in 1896. It caused great loss to South African farmers and led to troubles with the natives whose cattle were affected. Inoculation with a prepared virus has given encouraging results as a means of securing immunity. The stamping out process is the only way to combat the disease.

**Pleuro-Pneumonia**—This "lung-fever" is a contagious malignant disease of cattle attended by inflammation of and exudation on the pleura and in the lungs. A disease, somewhat similar, has recently attacked goats. This disease has been recognized since the close of the 18th century, and at present occurs in Europe, Asia, Africa and Australia, but is under control in Great Britain. It was introduced into the United States in 1843, and outbreaks were reported at intervals. By 1883 the disease was distributed throughout the Eastern States and as far west as Chicago, and constituted a serious menace to the live-stock interests of the country. No temporary measures could be used in dealing with this scourge. The only ones practicable were quarantine, restriction of movement of cattle, slaughter of affected animals and disinfection. The wisdom of such measures is vouched for by the results. Less than five years of time and the expenditure of \$1,500,000, under the auspices of the Bureau of Animal Industry of the Department of Agriculture at Washington, sufficed to place this disease under control, and no case has been reported in the United States since 1892.

**Anthrax**—This is a specific infectious disease of mammals including man, also known as splenic fever, charbon, wool-sorters' disease, etc., due to the presence in the blood of the micro-organism *Bacillus anthracis*. The dis-

eased animal may suddenly fall to the ground as in apoplexy and die, or it may live 10 to 24 hours or more in a sub-acute case. The symptoms are a high temperature, muscular trembling and labored breathing with prostration. The presence of the germ in the blood is proof of the disease. All carcasses should be burned, as if buried the germs may remain in the soil or be carried in the soil water. Cattle may be immunized by inoculating with attenuated virus, with toxins or antitoxin serums. Anthrax vaccine is on sale.

Blackleg, quarter-ill, etc., called also symptomatic anthrax, usually attacks young cattle. It is due to a bacillus. Immunity to this disease is conferred by vaccination with black-leg vaccine.

**Texas, Southern, or Spanish Fever**—Texas fever is a contagious fever of cattle caused by a parasitic protozoan (*Pyrosoma bigeminum*), and is carried from southern cattle to northern cattle by the southern cattle-tick (*Boophilus bovis*). Adult ticks fall from the cattle, lay eggs, and thus infest the soil with young ticks that carry the germs. Northern cattle passing over the ground, get the ticks and subsequently the fever. When the ticks fasten themselves to the skin of cattle, they inoculate them with the parasites, which, in an unimmune animal, rapidly multiply, enter and destroy the red corpuscles of the blood, causing high fever and a temperature of 106° F. or more, general weakness and finally death. In the later stages the urine is highly colored, showing the great loss of red blood cells, giving rise to the name "red-water" for the disease. These symptoms and the presence of the ticks enable the disease to be recognized. Post-mortem examination reveals an enlarged spleen, containing a dark tarry substance instead of normal pulp. The ticks can be destroyed by dipping the cattle in a light lubricating oil containing dissolved sulphur. In the South cattle may be kept free from the fever by keeping them free from ticks in an uninfected enclosure. Young calves may be rendered immune by keeping ticks on them, and a considerable degree of immunity can be conferred on animals by inoculating them with the blood of southern cattle, thus producing the fever. This disease is thoroughly disseminated throughout the southern parts of the United States, and in 1899 regulations were promulgated establishing a Federal quarantine line from Virginia to California, and controlling the movement of southern cattle into the Northern States.

**Foot and Mouth Disease or Aphthous Fever**.—This is a contagious eruptive fever, attacking cloven-footed animals and communicable to many others, including man. Eruptions occur as blisters in the mouth, on the udder, teats and feet, with an elevation of temperature of from 2 to 6 degrees. Although in mild attacks only 2 to 3 per cent of the animals attacked succumb, it depreciates the value of the survivors from 20 to 50 per cent. When present in a malignant form, 5 to 50 per cent of the adults die, and 50 to 80 per cent of the calves. It is more to be feared than pleuro-pneumonia. The milk from diseased cows may transmit the disease to those partaking of it, and the disease produced in this manner is, especially when it attacks children, serious and sometimes fatal. The disease was first seen and recognized in

England in 1839 where it continued with more or less prevalence until 1886, when it abated only to reappear in 1892, 1894 and again in 1902, although no cattle were imported into the United Kingdom during this period. In 1870 it was introduced into the United States from Canada. In 1886 it was very prevalent in Europe and has continued its ravages to the present time. The introduction of the disease into New England in 1902 drew attention to the dangers of the malady. Isolation and quarantining of diseased animals is futile, and slaughter of diseased animals and prohibition of movement of stock in the infected areas are looked upon as the most efficacious method of eradicating the disease.

**Tuberculosis.**—One of the most insidious diseases affecting cattle and other animals. Like human tuberculosis, it is due to a germ, the tubercle bacillus which may affect any part of the body where it can secure a lodgment. Recent investigations show that the same bacillus may cause human and bovine tuberculosis, hence there is need to guard against human infection with bovine tuberculosis, and particularly to guard children from tuberculous milk. Plenty of good food, fresh air and sunlight, rigid cleanliness, the use of disinfectants, and the determination and isolation of affected animals are now viewed as the best means of checking the disease. The tuberculin test is a ready means of determining whether or not cattle are tuberculous. Tuberculin is made by growing the bacterium for two or three weeks in bouillon to which glycerine is added. The germs are then killed by heating and their remains removed by filtration. Carbolic acid is added to prevent decomposition and the fluid is packed in sealed sterilized bottles. Inoculation with this fluid causes a rise in temperature in the case of diseased animals.

**Bibliography.**—Consult 'Reports' of Bureau of Animal Industry, Washington, D. C.; Fleming, 'Manual of Veterinary Science and Police' (London, 1875); Friedberger and Frohner, 'Lehrbuch der speciellen Pathologie und Therapie der Haustiere' (Stuttgart, 1900); 'Report' of Seventh International Congress of Veterinary Surgeons (Baden Baden, 1899); 'Bulletins' 53 and 63 (Texas fever), Agricultural Experiment Station, Texas; 'Special Report on Diseases of Cattle and Cattle Feeding,' U. S. Department of Agriculture, (Washington, 1892); Law, 'The Farmer's Veterinary Adviser' (Ithaca, N. Y., 1892).

S. FRASER.

**Rinehart, rin'hart, William Henry,** American sculptor: b. Carroll County, Md., 13 Sept. 1825; d. Rome 28 Oct. 1874. He apprenticed himself at 21 to a marble-worker of Baltimore, and 10 years later went to Italy where he remained two years. On his return to Baltimore he executed several busts, and a fountain for the U. S. general post-office. He did not stay long in the United States, though his success as a sculptor met with much appreciation here, but established himself in Rome in 1858. Among his best known works are the reliefs 'Night' and 'Morning'; his highly poetic and well-wrought 'Clytie' and 'Love Reconciles with Death'; 'Latona and her Children'; 'Antigone'; 'Athluta'; and 'Endymion.' He fin-

ished the bronze doors for the national Capitol, a work bequeathed to him by Crawford.

**Rinea, George Edwin,** American editor: b. Maitland, Hants County, N. S., 28 Dec. 1860. Coming to the United States when 11 years old his early education was obtained in the public schools of Brooklyn, N. Y. For several years after graduating from the high school there he engaged in mercantile life, but in 1887 resumed his studies at Colgate University, Hamilton, N. Y. In 1890 he entered the full Hebrew and Greek course in theology, and graduated from the Hamilton Theological Seminary in 1893. He was for two years pastor at Binghamton, N. Y., afterwards accepting a call to the pastorate of the First Baptist Church of Ridgewood, N. J., where he remained for three years. He resigned from the ministry to devote himself to literary work, and has been a frequent contributor to religious and other periodicals. In 1903 he was appointed managing editor of the 'Encyclopedia Americana,' to which he has contributed many articles.

**Ring,** an ornament for the fingers which has been worn from the most ancient period of civilization. Among the ancient nations who are known to have attached special importance to the wearing of rings are the Assyrians, Egyptians, Hebrews, Greeks, and Romans. From the earliest period rings are associated with signets, and appear to have been worn as ornaments, especially by females, on various parts of the body besides the hand. The nose, ears, arms, and even the legs and toes have, among various peoples, been decorated with them. Rings have also from a very early period been reckoned as symbols of authority, and that in a double aspect. As a mere ornament rings would serve to represent dignity and honor, and as signets they were early used officially to delegate authority. Rings and bracelets are mentioned among the presents made by Abraham's servant to Rebecca. Among the Egyptians rings were worn in great profusion. They were made of gold, with an engraved stone or scarabæus, and were often very massive. The Egyptian rings were often of great size, so as to cover the space from one joint to another of the finger. In Sparta only iron rings were used. The Romans are variously said to have adopted the use of rings from the Sabines, the Etruscans, and the Greeks. For long they were made chiefly of iron, though sometimes of stone, and every free Roman had the right to use a seal-ring. The association of rings with marriage may have come down to us from the Romans, the bridal-ring being regarded as a pledge for the fulfilment of a contract. At first ring-wearing was confined to men among the Romans and was practised only to a limited extent, but growing luxury led to the excessive use of rings by both sexes. The right of wearing gold rings was at first accorded only to ambassadors, chief magistrates, senators, and finally to persons of the equestrian order, while silver began to supersede iron among ordinary citizens. Till the close of the republic the use of gold rings was a privilege of the equestrian order. A ring appears from an early period to have been one of the insignia of the office of a bishop and was often worn. The restoration of a deposed bishop was effected at the Council of Toledo (633) by returning to him the episcopal ring. Rings have always been in great demand among savage tribes when they have either had ingenuity enough to invent them, or have

## RING AND THE BOOK—RINGGOLD GAP

come in contact with civilized nations who use them. Superstitious as well as sentimental feelings have often been associated with rings, and especially with the precious stones worn in them, to which particular characters were assigned. Rings were also used as charms against demons, evil eye, and other ills and inconveniences. Motto rings date from the time of the Romans; they appear also to have been in use among the Jews. They were long popular in Great Britain under the name of posies. See JEWELRY.

**Ring and the Book, The**, a poem of 21,000 lines by Robert Browning. This dramatic monologue, the longest and best sustained of Browning's poems, was published in four volumes in 1868-9, and is his greatest constructive achievement. It contains ten versions of the same occurrence, besides the poet's prelude, and presents from these diverse points of view the history of a tragedy which took place in Rome 170 years before.

**Ring-bone**, a bony excrescence on the pastern of a horse. It is a morbid growth, callus or exostosis, commonly due to inflammation, and in some cases extending to toe-joints with disabling effect. It is one of the more frequent ailments of horses and, although ordinarily affecting animals of inferior condition or injured by overwork, it sometimes appears in very young colts. While not always visibly impairing the serviceableness of a horse, ring-bone usually depreciates the market value of animals affected with it, and as cure is practically impossible it is a defect which calls for particular preventive methods in the care and breeding of horses, and for cautious scrutiny in the purchase of them.

**Ring-dove**, or **Cushat**. See DOVE; PIGEON.

**Ring-money**, in numismatics, an ancient metallic currency in the form of rings. This seems to have originated with the Egyptians, with whom rings were freely used as ornaments, and the same rings appear to have answered both purposes. The use of ring-money in Africa subsists to this day. A form of ring-money was also anciently used in Ceylon.

**Ring-ousel**, oo'z'l, a European thrush (*Turdus torquatus*), rather larger than a blackbird and of shy habits, preferring mountain slopes, heaths, and wild land to cultivated districts, but it often makes raids on fruit gardens and in vine countries feeds largely on grapes. In some parts of Scotland it is known as the moor blackbird. The song consists of a few loud, clear, and plaintive notes, and is somewhat monotonous. It is dark-brown with grayish wings and has a broad crescentic white gorget, whence the name. See OUSEL.

**Ring Plover**, or **Ringneck**, a common plover or dotterel (q.v.) of the whole northern hemisphere (*Ægialitis hiaticula*), distinguished by its black collar and its brilliant, gold-colored eyes. This bird was formerly celebrated in European folk-medicine. To be cured of the jaundice it was held to be only necessary to look fixedly at the bird's eyes with a firm faith in the success of the experiment. See PLOVER.

**Ring Snake**, the name of various serpents with a band encircling the body, especially

at the neck. In the United States the name belongs especially to a small harmless serpent of the warmer States (*Diadophis punctatus*), which is found "coiled up under stones, logs or the bark of fallen trees, chiefly in forests." It is bluish black above, yellowish orange beneath and has a whitish collar. In Great Britain the common grass-snake (q.v.) is often so called; in South America, the many-banded coral-snakes and in South Africa a large black and yellowish venomous hooded snake (*Sepeidon hamachates*) known to the Dutch as "ringhals," and differing from the cobras only in anatomical peculiarities. Consult Gadow, 'Amphibia and Reptiles' (1901).

**Ring-tailed Lemur**. See LEMUR.

**Ringgold Gap, Battle of**. After the expulsion of the Confederates from Missionary Ridge 23 Nov. 1863 they retreated on Dalton (see CHATTANOOGA, BATTLE OF). To intercept the retreat, Gen. Thomas, on the morning of the 26th, ordered Gen. Hooker to push on Graysville, from near Rossville, and directed Gen. Palmer, commanding Fourteenth corps, to report to Hooker and join in the movement. On reaching Pea Vine Creek Palmer was ordered to move directly on Graysville, while Hooker, with his three divisions—Osterhaus', Geary's, and Cruft's—moved on Ringgold to strike the Confederate line of retreat six miles farther south. At 9 p.m. Palmer struck the Confederate rearguard, capturing three guns and some prisoners. Pushing on to Graysville, which was reached at 11 p.m., he captured more prisoners and another gun, and bivouacked for the night. Hooker advanced to within six miles of Ringgold, and late in the night bivouacked a short distance to the right of Palmer. At daybreak of the 27th Hooker renewed the pursuit, Osterhaus' division, in the advance, capturing many prisoners, and pursuing the Confederates into Ringgold. At 3 a.m. of the 27th Gen. Cleburne, whose division was acting as rear-guard to Hardie's corps, received an order from Gen. Bragg to hold Ringgold Gap, in Taylor's Ridge, near the town, until the trains and rear of the retreating troops could get well advanced. Cleburne disposed his four brigades of about 4,200 men on the ridge, on each side of the gap, and as a support two guns in it, and in less than half an hour Hooker came up and Wood's brigade of Osterhaus' division was ordered to attack. Cleburne's skirmishers were soon driven in; but Cleburne, assuming the offensive, attacked Wood's main line and was repulsed, Wood's men following to the gap. Meanwhile Williamson's brigade had made a lodgment on a spur of Taylor's Ridge, half a mile to the left of the gap, but found the Confederates so strongly posted that it could make no headway, and Creighton's brigade of Geary's division was ordered to ascend the ridge still farther to the left. Cleburne had anticipated the movement, by still farther extending his right. Col. Creighton, making a gallant assault, was badly repulsed, and in falling back he carried part of Williamson's brigade with him. While Creighton was preparing for another assault he was killed, and operations on that part of the field were suspended. Meanwhile sharp work was going on in the gap and on the line on either side of it, without any material advantage to

## RINGWORM—RIO GRANDE DO NORTE

Hooker. Between 12 and 1 o'clock Hooker's artillery came up and opened a furious fire upon Cleburne's position, but Cleburne had gone, leaving only a few skirmishers in the gap. These were closely followed by some of Geary's men to the bridges beyond the gap. Gen Grant arrived on the field early in the afternoon, and ordered pursuit discontinued; later in the day Grose's brigade went forward, but encountering cavalry, supported by infantry, it returned to Ringgold. The Union loss at Ringgold Gap was 65 killed and 377 wounded. The Confederate loss, as reported by Cleburne, was 20 killed, 100 wounded, and 11 missing. Consult 'Official Records,' Vol. XXXI.; and Van Horne, 'History of the Army of the Cumberland,' Vol. I.

E. A. CARMAN.

**Ringworm**, a disease occurring in three varieties, in one of which it attacks the scalp, in another the beard, and in the third some other part of the body. In all cases it is due to the presence of a vegetable parasite, consisting of minute round bodies, and of thread-like structures formed of rows of rod-shaped bodies of a beaded appearance. This is the growing fungus (*Trichophyton tonsurans*) and its spores, and wherever ringworm occurs this is present between the layers of cells of the scarf-skin, in hairs and hair-sheaths. Ringworm of the body (*Tinea circinata*) is the name given to the disease when it occurs on non-hairy parts of the body. It is most common on the face, neck, and trunk, but it also occurs on the hands, arms, and wrists. It consists of small circular patches, rose-colored and slightly raised, covered with small branny scales. Usually round the margin is a ring of very small blisters. The spot is the seat of a tingling and itching sensation. It spreads round the margins, and as it spreads the centre heals up, so that a large red ring with a pale centre is formed. Ringworm of the scalp (*Tinea tonsurans*), identical with favus (*Tinea favosa*), begins with small red patches like those described above and spreads at the margins. It involves the hairs, which become penetrated by the fungus, and are dry, dull, and twisted. They are easily pulled out and become very brittle. The affected patch becomes covered with a grayish-white powder. Inflammation may be produced and crusts formed. This variety of ringworm is commonest in children. Ringworm of the beard (*Tinea sycosis*) is similar to the scalp variety. A lotion of bichloride of mercury is often sufficient to kill the fungus, but if it prove ineffectual glacial acetic acid may be painted all round the spreading margins of the ring. In ringworm of the head and beard the hair of the diseased patches and for a little distance beyond should be cut short, and crusts should be removed by poulticing, washing with water and soft soap, etc. The general health should be maintained by the use of tonics and otherwise. Ringworm is very contagious.

**Rio Branco**, *rê'ô brâng'kô*, a large river of Brazil, entirely in the state of Amazonas. It rises on the eastern slopes of the Serra Parima, near the sources of the Orinoco, flows eastward parallel to the Serra de Pacaraimo, turns southward before reaching British Guiana, and joins the Rio Negro about lat. 1° 25' S, lon. 61° 10' W. It has a length of about 830 miles, and receives numerous affluents.

**Rio Cuarto**, *koo-âr'tô*, Argentina, a town of Córdoba province, near the source of the Cuarto River, on the railroad midway between Belleville and Villa Mercedes, 179 miles south of Córdoba. It is the distributing centre of a large agricultural region. Pop. 14,000.

**Rio Grande**, *rê'ô grând* (Sp. *grân'dá*), or **Rio Grande del Norte**, a river which has its rise in the southwestern part of Colorado, flows south and southeast until it enters New Mexico, when its general course about half way across the Territory is south by west, then south by east to El Paso (q.v.), whence it forms the irregular boundary between Texas and Mexico. It enters the Gulf of Mexico after a course of nearly 1,900 miles. It is navigable for small boats only to Kingsbury Rapids, near Presidio, about 460 miles from its mouth. In the upper course the banks are generally high, and the irregular rocky beds form rapids and waterfalls. In the lower part of its course, the stream is shallow, and it is subject to periodical inundations. The largest tributary is the Pecos River, which enters the Rio Grande from Texas. A number of U. S. forts are on this river. The most important places are Brownsville, Eagle Pass, Laredo, and El Paso in Texas; and Matamoros and Nuevo Laredo in Mexico. A few villages and towns of importance are on the banks of the river in New Mexico.

**Rio Grande de Cagayan**, *rê'ô grân'dá dá kâ-gâ-yan'*, the largest river of the island of Luzon, Philippines. It rises on the northeastern slope of Carabellos Sur, and flows north in a winding course to the China Sea. It drains a large territory, and has numerous tributaries, the chief of which are the Magat and the Chico de Cagayan; its valley is very fertile, the land being used mainly for the cultivation of tobacco. The river is navigable for vessels drawing 12 feet as far as Lal-lo, 13 miles from its mouth; and for light draft vessels for 200 miles in the wet season. Freshets occur at times with a rise of several feet in a few hours.

**Rio Grande College**, located at Rio Grande, Ohio; founded in 1876 under the auspices of the Free Baptists. It offers a classical and a scientific course, and confers the degrees of bachelor of arts and bachelor of science. There is also a preparatory department. The college is co-educational, and women constitute fully one half of the student body. The grounds and buildings in 1910 were valued at \$40,000; the library contained 3,500 volumes; the productive funds amounted to \$76,000; and the annual income to \$6,000. The students numbered 175 and the faculty 10.

**Rio Grande de Mindanao**, *rê'ô grân'dá dá mên-dá-now'*. See MINDANAO, GRANDE DE.

**Rio Grande do Norte**, *rê'ô grân'dá doo nôr'tá*, an important maritime state in the northeast of Brazil; area, 22,196 square miles. The surface is mountainous in the south and southwest, where it is covered by several mountain ranges. The principal rivers have all either a north or an east direction. The proximity to the equator makes the climate intensely hot; it is said, however, not to be unhealthful, the air being remarkably pure. The soil is generally good, but not remarkable for its fertility. For a long time the sugarcane was the principal cultivated crop, but considerable tracts formerly

## RIO GRANDE DE LA PAMPANGA —RIO DE JANEIRO

devoted to it are now occupied by cotton, which may be regarded as the staple of the province. The other leading crops are manioc, millet, and haricots. Many of the plains are grazed by large herds of horses and cattle. The minerals include gold, silver, iron, salt, amethysts and rock-crystals, limestone, sandstone, and granite. The forests are not very extensive. Pop. 268,273.

**Rio Grande de la Pampanga, rê'ô grân'dâ dâ là pâm-pân'gâ.** See PAMPANGA, RIO GRANDE DE LA.

**Rio Grande do Sul, rê'ô grân'dâ doo sool,** a southern maritime state of Brazil; area, 91,336 square miles. Along the coast for more than half the extent of the coast-line of this state stretches the great Lago dos Patos, which communicates with Lake Mirim, and which receives the rivers of the southeastern part of the territory. Those to the southwest belong to the basins of the Paraná and Uruguay, and flow west. The mountain chain called Serra Geral divides the state into two unequal parts. The sea-coast is flat and sandy, and is lined by a series of reefs, which make the navigation dangerous. The interior is partly occupied by arid serras, but is mostly fertile. The climate is temperate, and the productions are more like those of Europe than of the rest of Brazil. Maize, rice, and flax, particularly the first, are largely cultivated. The finer European fruits, especially figs and peaches, find a genial soil. The minerals include gold, iron, sulphur, and porcelain clay of the finest quality. The chief occupation of the inhabitants is the rearing of cattle and the preparation of dried beef. Horses and mules are also reared. A number of German colonists and many Italians have settled in the state. There are several railways. Porto Alegre is the capital. Pop. 897,455.

**Rio de Janeiro, rê'ô dâ zhâ-nâ'rô,** Brazil, one of the maritime states on the southeast coast of the republic; area, according to official returns, 26,634 square miles. The central part of this territory is mountainous, being traversed generally from east to west by a series of ranges, of which the loftiest and most conspicuous is the Serra dos Orgãos or Organ Mountains (q.v.). They are almost entirely composed of granite. The mountains slope down on the north and south—in the former direction toward the basin of the Parahyba, to which all the surface of the province on that side belongs; and in the latter to the coast, which receives the drainage from a great number of comparatively small streams, each carrying its waters directly to the ocean. The shore toward the northeast is lined by numerous lakes and lagoons. The soil does not seem to possess much natural fertility. Great part of it consists of a retentive clay, ill adapted for agricultural operations; but the warmth and moisture of the climate are so favorable to vegetation that magnificent forests and valuable crops are found, and there are many tracts of the richest land which are turned to the best account. The crop which attracts the largest share of attention is coffee. The other leading crops are sugar, rice, millet, manioc, and cotton. The forests are rich in timber, both for ordinary and ornamental purposes; in dye-woods, in gums and balsams, and valuable medicines. The domestic

animals, originally imported from Europe, have increased considerably, and immense herds of cattle are reared. This province is not rich in precious metals. Iron, however, abounds, though it is not worked; and the decomposition of granite has formed extensive beds of the finest kaolin. The state assembly used to meet at Nictheroy, but Petropolis is the present capital. Under separate jurisdiction from the state is the federal district of Rio de Janeiro, embracing the city of the same name (q.v.) and its surroundings. The population, inclusive of the federal district, according to the last census was 1,399,535.

**Rio de Janeiro,** capital of the United States of Brazil; socially and commercially the most important city of South America, excepting Buenos Ayres. The name is supposed to perpetuate an error of the discoverers (1 Jan. 1502), who, seeing the great length of the bay, assumed that it was the mouth of a river (*rio*). It is, in fact, a capacious and excellent natural harbor, with an area 68 square miles greater than the combined areas of the lower and upper bays of New York. But the bottom has silted up so much in recent years that the water near the shores has become too shallow for large vessels. Accordingly, some of the old mooring places have been abandoned. Merchant vessels which are unable to reach the docks cast anchor on the north side of the city, and their cargoes are transported in lighters. The future prosperity of Rio depends upon the successful execution of the plan for harbor improvements, which in 1903 was entrusted by the government to a British firm. Modern facilities for handling freights are to be provided in connection with a wide quay of solid masonry, which will extend along the entire northern front to a deep artificial channel. The outer wall of this quay, for about two miles, will be accessible to the largest shipping, and railway trains will run to the same point. This important work will, it is thought, be completed in 1910. The city proper is very compactly built on flat land adjoining the bay, but its suburbs stretch out along the shores for more than 17 miles. Above the crowded central portion rises Sugar Loaf Peak (*Pão d'Açúcar*), and on the same side of the harbor is the fortress called São João—opposite which, on the eastern promontory, is Santa Cruz fortress. A small island, lying in the entrance between São João and Santa Cruz, is also fortified; and other defensive works are located in the bay on an island, which takes its name from the French adventurer Villegaignon, who tried to establish a colony of Huguenots there (1555-60). The main body of the city, covering less than a square mile, is divided into regular squares by narrow streets, along which pass lines of electric or horse cars, furnishing the only available means of transportation. The length of these lines is about 175 miles, and in 1897 the companies carried 83,000,000 passengers. The number of buildings in Rio is approximately 50,000, and its total area is sometimes said to be equal to that of any other capital in the world, but in such reckonings forest-covered hills are included. The most attractive suburban districts are Botafogo and Laranjeiras, the former built around an arm of the bay, the latter in a valley at the foot of

## RIO NEGRO—RIOJA

Mount Corcovado; in both the residences are surrounded by beautiful tropical gardens. The National Museum, formerly the Imperial Palace of Boa Vista, is in the district of São Christovão. Some of the finest buildings—the Senate, City Hall, Mint, Normal School, Quartel-general, etc.—surround the old park, Praça 15 de Novembro, now called Campo de Sant' Anna. The Department of Foreign Relations occupies the old Palace of Itamaraty; the present government palace was formerly the luxurious residence of Conde de São Clemente the Chamber of Deputies, Department of Telegraphs, and Historical Institute are installed in the old Paço Palace. On the other hand, a fine modern building is devoted to the Department of Industry. An especially interesting feature is the Botanical Garden, in which rare exotics from all countries of the globe are cultivated, side by side with specimens of the flora of the various parts of South America. The Cathedral and Church of Santa Cruz stand near the water front, in a large square from which starts the main business street, Primeiro de Março. The rendezvous for men of prominence, an "open-air club," and the active centre of municipal life, is the Rua Ouvidor, a street of restaurants, book-shops, and newspaper offices. The very large wholesale and foreign trade of the city is in the hands of Portuguese, Brazilian, English, German, and French merchants. In the list of exports, coffee is the principal item; imports consist chiefly of food products and manufactured articles. There are at Rio cotton mills, furniture manufactories, foundries, dry docks, a naval arsenal, etc. A system of railways, of which the capital is the centre, covers the state and the southern part of Minas Geraes. The "Brazil Central" system is the most important in the republic, connecting Rio with São Paulo, and having a large number of branch lines, beside controlling the terminal facilities of the port and the suburban traffic. Originally known as the Dom Pedro Segundo Railway, this line was begun by a company in 1857, under a governmental guaranty. In 1860 the imperial government took control of it. Since the establishment of the republic the line has been extended to a length of 759 miles, and the cost of this system to the government has been approximately \$97,300,000 gold, or \$126,000 per mile. The road is moderately well built and equipped. Beside the numerous suburban trains, there are seven daily trains running to Barra do Pirahy, the junction point of the São Paulo and Minas divisions. Vessels entering the port in 1900 numbered 1,703, including 860 coasting vessels; those clearing numbered 1,707 (coastwise 917). The number of inhabitants is more than 800,000. On account of "poor sewerage and lack of hygienic measures," the city is one of the most unhealthy in Brazil. Yellow fever is endemic; smallpox and tuberculosis make great ravages from time to time. In the low-lying central section the heat of summer is exceedingly unpleasant, though elevated places in the vicinity—Corcovado Mountain, Petropolis (q.v.), Nova Friburgo, and other resorts—have an admirable climate. The water supply is regarded as very good. For public instruction see EDUCATION IN LATIN AMERICA. Useful institutions of public charity are the hospitals of the Sociedade de Beneficência and the

very large Santa Casa de Misericórdia, the former supported by the philanthropic Portuguese colony. Some events in the early history of this region are mentioned in the article BRAZIL. In Rio and São Paulo in 1870 was organized the Republican party, which brought to pass the overthrow of the monarchy without bloodshed (15 Nov. 1889); and the bay of Rio de Janeiro was the principal scene of the revolt of the navy, which, from 6 Sept. 1893 to March 1894, menaced the new Brazilian institutions. Compare: 'United States of Brazil: A Geographical Sketch,' Washington, Government Printing Office (1901).

MARRION WILCOX,  
Authority on Latin America.

**Rio Negro**, *rê'ô nê'grô* ("black river"), the name of numerous streams, of which two are important: (1) A river of South America, and principal tributary of the Amazon. It rises in Colombia, and joins the Amazon after a course of about 1,000 miles at Manaus, Brazil. Through its affluent, the Cassiquiare, there is direct communication between the Amazon and Orinoco. (2) A river of South America forming the boundary between the Argentine Republic and Patagonia. It rises in the Andes in Chile, and is about 700 miles long. Its current is very rapid, and its bed obstructed with shoals and sand banks.

**Rio de la Plata**, *rê'ô dâ lâ plâ'tâ*. See PLATA, RIO DE LA.

**Riobamba**, *rê-ô-bâm'bâ*, Ecuador, a town on the Pastaza River, a branch of the Amazon, about 100 miles from Quito. A former town of the same name, at the foot of Chimborazo Mountain, about 9 miles from the present town, was destroyed by an earthquake in 1797. Riobamba has a population of about 17,000, most of them Indians.

**Rioja**, *Francisco de, frân-thês'kô dâ rê-ô'hâ*, Spanish lyric poet: b. Seville about 1600; d. Madrid 8 Aug. 1659. He studied first law and then theology. The minister Olivarez obtained for him a prebend in the cathedral of Seville, and then became royal historiographer, inquisitor at Seville, and lastly, inquisitor of the supreme tribunal of the holy office. The downfall of his patron involved his own: he was imprisoned, and only obtained his liberty after he had undergone a formal trial and completely established his innocence. Philip IV., whose favor he had regained, made him director of the royal library and councillor in the supreme court of the Inquisition. As a poet, he formed himself on the classic and Italian models, particularly Horace and Seneca; kept himself, in style and language, free from the tasteless eccentricities of his contemporaries, and thus preserved the true spirit of the lyric. His 'Silvas' exhibit rich pictures of rural life, remarkable for their truth to nature. His works were published with a biography by D. Cayetano de la Barrera, 'Poesias' (1868); and 'Adiciones a las poesias de D. Francisco de Rioja' (1872). Consult Longfellow, 'Poets and Poetry of Europe' (1843).

**Rioja**, La, Argentina; (1) the capital of a province 118 miles by rail southwest of Catamarca, at the foot of the Sierra Velasco, in the midst of vineyards and orange groves. Pop. about 7,000. (2) A western province north

of San Juan and south of Catamarca, with an area of 69,502 square miles, divided into 18 departments. While in the east and south there are salt and sand deserts, it is well watered on the west, and agriculture and cattle rearing are important industries. Excellent wheat, fruits, and wine are produced. The climate is dry and healthful. Near Chilceto and Famatina are valuable gold, silver, and copper mines. Pop. about 79,000.

**Rion**, *rē-on'*, or **Rioni**, *rē-ō-nē*, from **Phasis**, a river of Colchis (Transcaucasia, Asiatic Russia), anciently regarded as the boundary between Europe and Asia. It was afterward held as the boundary line between Colchis and Asia Minor. It rises in a spur of the Caucasus (Moschici), and after receiving the rivers anciently called the Rhion, the Glaucaus, and the Hippus, it falls into the Euxine near the ancient town of Phasis. In the early part of its course it was called the Boas. Its modern name is Rion or Rioni. Other rivers were sometimes confounded by ancient writers under the same name with this. The Phasis of Xenophon was the Araxes.

**Riordan**, *rē-ōr-dan*, **Patrick William**, American Roman Catholic archbishop: b. New Brunswick 27 Aug. 1841. He was educated at Notre Dame, Ind., and was graduated from Louvain, Belgium in 1864. He then returned to Chicago, accepted the chair of theology at the Seminary of Saint Mary's of the Lake, and in 1868-71 was pastor of Saint Mary's church at Joliet, Ill. From 1871-83 he was in charge of Saint James' Church, Chicago, and in the latter year was consecrated titular archbishop of Cadesa and was made coadjutor. He succeeded to the see of San Francisco in 1884.

**Riordan**, **Roger**, American artist and author: b. Ireland, 1848; d. 1904. He studied art at the Art Students' League in New York, contributed as illustrator and writer on art subjects to various magazines, and served on the international jury of awards at the Paris Exposition, 1900. He published 'Sunrise Stories, a Glance at the Literature of Japan'; 'French Etchers,' and collaborated on the Catalogue of the Marquand collection.

**Riot**, a disturbance of the public peace, attended with circumstances of tumult and commotion, as where an assembly destroys, or in any manner damages, seizes, or invades private or public property, or does any injury whatever by actual or threatened violence to the persons of individuals. By the common law a riot is an unlawful assembly of three or more persons which has actually begun to execute the common purpose for which it assembled by a breach of the peace, and to the terror of the public. A lawful assembly may become a riot if the persons assembled form and proceed to execute an unlawful purpose to the terror of the people, though they had not that purpose when they assembled. In England, every person convicted of riot is liable to be sentenced to hard labor. In Scotch law rioting is termed mobbing. A person may be guilty of mobbing who directs or excites a mob, though he is not actually present in it. Mere presence without participation may constitute mobbing. A majority of the States of the American Union have riot acts somewhat similar to those of England, and the

common law governs where no statutes have been enacted.

**Riouw-Lingga**, *rē'ow līn'ga*, or **Riou Lingga**, an archipelago southeast of the Malay Peninsula, belonging to Netherlands. It is formed of two groups of islands, the northern group is that of Riouw, and the southern, Lingga. There are about 30 islands in the Riouw group, the largest, Bintang, has an area of 400 square miles. Lingga, of the Lingga group, has an area of 320 square miles; Singkep, 204 square miles. The soil of the greater part of the archipelago is fertile, and the whole is well wooded. The principal export is gambir; other exports are pepper, sago, and rice. Tin has been mined and exported for many years. The original inhabitants have nearly all disappeared; the population now is made up of Chinese, Japanese, Javanese, and Kinga. Pop. about 78,000.

**Rip-rap**, a common name applied to broken stones used for beds, walls and foundation in building and construction. See **Masonry**.

**Rip Van Winkle**, *rip vān wīng'kl*, a character in one of Washington Irving's legends of the Hudson Valley. While hunting among the mountains he falls in with the reputed followers of Hendrik Hudson and by drinking the liquor they offer him is cast into a sleep of 20 years. When he awakes and returns to the village of Laughing Water, he finds all things changed, but is chiefly relieved to discover that his wife, the irritating obstacle to his easy-going life is no longer alive. The story was dramatized by Joseph Jefferson (q.v.) and formed one of the important rôles in his repertory.

**Riparian Rights** are those of one who owns the land bounding upon a water course; such owner is the proprietor of that portion of the bed of a river which adjoins his land; such rights upon navigable waters depend largely upon statute and customs of the different jurisdictions. A riparian owner has the right of access to navigable water, and for that purpose to erect a wharf or pier, provided it does not encroach upon the navigable waters sufficiently to interfere therewith. A riparian owner has also a right to the accretions of the soil and to fish in the adjacent waters; he has also the right to have the stream flow naturally without changing it in quantity or otherwise. Such owner is not entitled to the water, but merely to its use, and is without the right to divert, obstruct or corrupt the stream, except to build such lawful obstructions as may be necessary for bridges, wharves and dams. Riparian rights of property are established property, of which the owner cannot be deprived except by due process of law. (See **RIVERS**.)

**Ripley**, *rip'li*, **Eleazar Wheelock**, American soldier: b. Hanover, N. H., 15 April 1782; d. West Feliciana, La., 2 March 1839. He was graduated from Dartmouth College in 1800, engaged in law practice and in 1811 settled at Portland, Maine. In 1810-11 he was a member of the Massachusetts legislature, served as speaker in the latter year and in 1812 was elected State senator. At the outbreak of the War of 1812 he entered the army, became brigadier-general in 1814, and for services at Niagara, Chippewa, and Erie was voted a gold medal

## RIPLEY—RIPON

by Congress. He remained in the army until 1830 when he removed to Louisiana and resumed the practice of law. He afterward served in the State senate and was a member of Congress from 1835 until his death.

**Ripley, George**, American author: b. Greenfield, Mass., 3 Oct. 1802; d. New York 4 July 1880. He was graduated at Harvard in 1823, studied theology at Cambridge and in 1826 was ordained a Unitarian minister in Boston. He became interested in the principles of Fourier, Comte, and St. Simon, and made translations of the writings of modern German and French philosophers and endeavored to introduce their ideas in America. He collaborated with Dr. Hodge on a large work in 14 volumes, 'Specimens of Foreign Standard Literature' (1838-42). His 'Discourses on the Philosophy of Religion' (1839) gave rise to a long and bitter controversy with Professor Andrews Norton of Cambridge. He was a leader in the Transcendental Movement originating in 1836 in association with Emerson and others, wrote frequently for 'The Dial,' the organ of that movement. In 1841 he definitely retired from the ministry and became the prime mover in the communistic enterprise of Brook Farm (q.v.), and in 1844 invested all his small fortune in that settlement in West Roxbury. After the burning of the phalanstery in 1846 and the dispersion of the colony, he went to New York as literary editor of the *Tribune*; contributed also to the literary department of 'Harper's Monthly.' With Bayard Taylor he edited a 'Handbook of Literature and Fine Arts' (1852), and in 1858, with Charles A. Dana (q.v.), began the editing of 'Appleton's New American Encyclopedia.' Consult: Frothingham, 'George Ripley' (1882); Swift, 'Brook Farm' (1909).

**Ripley, James Wolfe**, American soldier: b. Windham, Conn., 10 Dec. 1794; d. Hartford, Conn., 16 March 1870. He was graduated from West Point in 1814, served in the second war with Great Britain, his first engagement being in the defense of Sackett's Harbor. In 1818 he was promoted lieutenant, fought in the Seminole war and was appointed commissioner to establish the boundary line of the Florida reservation in 1823-4. He was captain in command of Charleston Harbor at the time of the Nullification troubles in 1832-3 and in 1841-54 was superintendent of the Springfield Armory. He was brevetted lieutenant-colonel in 1848 for services in the Mexican War, receiving full rank in 1854. He was promoted brigadier-general in 1861, and after 1863 was inspector of fortifications on the coast of New England. He was brevetted major-general in 1865.

**Ripley, William Zebina**, American educator and economist: b. Medford, Mass., 1867. He was graduated from the Massachusetts Institute of Technology in 1890, made a specialty of economics and in 1893 became lecturer at Columbia. In 1895-1901 he was professor of economics at the Massachusetts Institute of Technology and since 1901 has occupied that chair at Harvard. He has published: 'Financial History of Virginia' (1893); 'The Races of Europe' (1899); etc.

**Ripley, Ohio**, village in Brown County, on the Ohio River, and on the Chesapeake & Ohio railroad; 45 miles southeast of Cincinnati. It

was founded about the time of the War of 1812, and was at first called Staunton; later its name was changed in honor of General Ripley, an officer in the war. For a time the county courts were held here, but the county-seat was finally moved to Georgetown. The first station on the "underground railway" for runaway slaves was located in Ripley. It is in a noted tobacco region, and has a number of tobacco packing houses and factories; its other industrial establishments include a piano factory and shoe factories, and it carries on a considerable river trade. Pop. (1910) 1,840.

**Ripon, rip'ôn**, England, a cathedral city in the county of York (West Riding), on the Ure, 22 miles by rail northwest of York. The cathedral of Saints Peter and Wilfrid, restored 1862-76, is one of the finest churches in England; length, east to west, 266 feet; width of transept, 132 feet; the three towers 120 feet high, were crowned by spires prior to 1660. The city has also other fine ecclesiastical, municipal, and benevolent institutions. The principal manufactures are machinery, saddle-trees, leather, and varnish. The abbey of Ripon was founded in the 7th century, and the Saxon crypt of the cathedral was probably built by Wilfrid in 674-678. The see of Ripon was established in 1836.

**Ripon, Wis.**, city in Fond du Lac County; on Silver Creek, an inlet of Green Bay, and on the Chicago & N., the Chicago, M. & St. P. R.R.'s; about 85 miles northwest of Milwaukee, and 18 miles west by north of Fond du Lac.

Ripon was settled in 1844 by the "Wisconsin Phalanx" (q.v.) an organization of 19 members, founded at Southport, Wis. The "Phalanx" was based upon Fourier's principles, but only the best of Fourier's rules were followed; free-love ideas never gained a foothold here. The advantages for farming in the rich Ceresco Valley caused the "Phalanx" to locate in what is now Ripon and the surrounding lands. The name they gave to the valley, Ceres, the goddess of grain, and Co., company, making Ceresco, shows that agriculture was of first interest. The city was named Ripon by John Homer, whose ancestors had lived in Ripon, England. The "Phalanx" prospered and held together as an organization for six years. The reports of gold in California was one of the causes of unrest which led to the voluntary and peaceable disbanding of the organization in 1850. The enterprise had prospered so well that at the final division eight per cent above par was paid on the stock. The city was incorporated in 1849 and chartered in 1858. Ripon claims to be the birthplace of the Republican party, and one of the historic buildings is pointed out as the place where the first meetings were held and where the party received its name. The chief industrial wealth of the city is connected with the products of the rich farms of the valley. Grain, fruit and vegetables are abundant, and the dairy products are of considerable value. The chief manufacturing establishments are knitting works, in which there are 200 employees; glove factory, 50 employees; carriage works, 50; machine shops, 20; and pickling works, creameries, box and crate factories, and flour and feed mills. There are 10 churches, and a number of fine business blocks. The educa-

## RIPON COLLEGE—RITE

tional institutions are Ripon College, organized in 1851, a high school, graded elementary schools, and a free public library. The two banks have a combined capital of \$175,000. The government is vested in a mayor and a council of eight members, who hold office two years, four of whom are elected each year. Ripon is a favorite summer resort on account of its climate, beautiful scenery, and the attractive drives to nearby points of interest. Pop. (1900) 3,818; (1910) 4,090. The population doing business in Ripon is about 7,000.

C. H. ELLSWORTH

Editor 'The Ripon Commonwealth.'

Ripon College, located at Ripon, Wis., organized in 1853. Though the Congregationalists have contributed largely to its support and prosperity, it is not under denominational control. Its organization includes a collegiate department, a preparatory department, and departments of music and of art; normal courses are also given. In 1901 the group system of elective studies was adopted and a new professorship in history and economics established; the collegiate courses are arranged in three general groups, classical, literary and scientific, but only the one degree of A. B. is conferred. Women are admitted to all departments. The campus includes 10 acres; the grounds and buildings in 1910 were valued at \$196,300; the library contained 19,000 volumes, and the annual income was \$62,000. The students for the year 1910 numbered 258, and the faculty 26.

**Ripple-mark**, a furrowed or wavy surface often caused on sand by the motion of water or the action of wind, or by their combined agency. Such marks are seen on sandstone of all ages, where they are considered to have been produced by the ripple of the tide on what was once the sandy shore of an ancient sea. Beach ripple may generally be distinguished from ripples due to currents by the frequent changes which occur in its direction.

**Rise of the Dutch Republic**, *The*, a historical work by John Lothrop Motley, first published in 1856. It proved an immediate popular success; and was followed by a French translation (supervised with an introduction by Guizot) in 1859, and soon after by Dutch, German, and Russian translations.

**Rishia**, rī'shī or r'shī, sages of the Hindu mythology, sprung from the mind of Brahma, and attendants in alternate months on the sun. Seven of them are enumerated. The Rishis were also inspired sages, of whom the Vuhnu Purana enumerates three kinds—royal rishis, or princes, who have adopted a life of devotion; divine rishis, who are both sages and demigods; and Brahman rishis, or sons of Brahma. Rishi afterward came to be applied to all personages distinguished for piety and wisdom.

**Risley**, rīz'li, Richard Voorhees, American novelist: b. New York 8 Nov 1874; d. there 30 March 1904. He was educated in military and other schools and spent several years in foreign travel. He has published: 'The Sentimental Vikings' (1897); 'Men's Tragedies' (1899); 'The Sledge' (1900); 'The Anvil.'

**Ristori**, rēs-tō'rē, Adelaide, Italian actress: b. Cividale, Italy, 29 Jan. 1822; d. Rome, 9 Oct. 1906. She appeared on the stage as a child, and her early parts were in Soldoni's

comedies. After her marriage in 1846 to the Marchese Giuliano del Grillo she retired from the stage for a time, but after her return she devoted herself thenceforth to tragic roles. In 1855 she appeared in Paris in Silvio Pellico's tragedy of 'Francesca da Rimini' and achieved a great success. Her engagement there was followed by a tour of Europe and from that time she was frequently seen in the large cities of the Continent and Great Britain. She made her first appearance in America at the Lyric Theatre, New York, 20 Sept. 1866, and her tour of the United States lasted for eight months. In 1869 she played in South American cities and in 1874 made a journey round the world. She made her fourth and last visit to the United States in 1884 and during that tour which ended in May of the following year appeared as Lady Macbeth in company with Edwin Booth. After 1885 she did not appear on the stage. Her greatest parts were Mary Stuart, Myrrha, Medea, Phædra, Lady Macbeth and Queen Elizabeth.

**Ritchie**, rīch'i, Anna Cora Ogden Mowatt, American actress and author: b. Bordeaux 1819; d. Henley-on-Thames, near London, England, 28 July 1870. She was successful as a playwright and dramatic reader, and in 1845-54 appeared with much favor on the stage in both the United States and England, where she was seen with E. L. Davenport (q.v.). Some of her books were published under the pseudonyms of 'Isabel' and 'Helen Berkley.' They include: 'The Fortune-Hunter' (1842); 'The Mute Singer,' 'Fashion,' a comedy (1847), which was very popular; 'Evelyn' (1845); 'The Autobiography of an Actress' (1854), the best-known and most popular of her productions; 'Mimic Life' (1855); 'Fairy Fingers' (1865); 'The Clergyman's Wife' (1867).

**Ritchie**, Anne Isabella Thackeray, English author: b. London 1837. She is the eldest daughter of William Makepeace Thackeray (q.v.) and was educated at Paris and Kensington and in 1877 was married to Richmond Ritchie. Her first literary work was published in the 'Cornhill Magazine' while her father edited that periodical. In 1863 she published 'The Story of Elizabeth' which met with success. Since that time she has published fiction, biography and literary reminiscences, among which may be named: 'The Village on the Cliff' (1865); 'To Esther, and Other Sketches' (1869); 'Old Kensington' (1873); 'Toilers and Spinners' (1873); 'Bluebeard's Keys' (1874); 'Miss Angel' (1875); 'Anne Evans' (1880); 'Madame de Sévigné' (1881); 'A Book of Sibyls' (1883); 'Mrs. Dymond' (1885); 'Records of Tennyson, Ruskin and Browning' (1892). The biographical edition of Thackeray's works was edited by her, and her prefaces and notes contain a partial substitute for an authoritative biography against which Thackeray left a prohibition. Her 'Chapters from Some Unwritten Memoirs' (1895) is a work of autobiographical character.

**Rite**, in religious use, any external sign or action employed as an expression of reverence or devotion, or as a means of exciting internal religious sentiments. The ancient religion of Judaism abounded in rites and ceremonies, and the sect or school of the Pharisees appears to have laid more stress on compliance with these

observances than on the weighty injunctions of the law. Jesus Christ repeatedly expressed contempt for the scruples of the Pharisees, and many of those who aim to walk strictly in his footprints repudiate everything like ceremonialism in divine worship. But the vast numerical majority of Christians demand a more or less stately and impressive ceremonial. Rite is used also to express the sum of the ceremonial employed in the administration of the sacraments, as, the "rite" of baptism, the "rite" of confirmation, "the last rites"; again, the entire liturgical ceremonial of a particular branch of the church is spoken of as a "rite," for example, Latin rite, Greek rite, Syrian rite, etc.

**Rites, Congregation of,** a commission or standing committee of cardinals of the Roman Catholic Church, instituted in the 16th century by Sixtus V. Its function is to exercise supervision throughout the entire church over all ecclesiastical rites and ceremonies, in particular those belonging to the Mass, with a view to prevent the introduction of novelties without express approval, and to maintain unaltered the usages sanctioned by the tradition of the Fathers and the prescriptions of the rubrics. It is the Congregation of Rites that takes cognizance of all matters concerned with the beatification and canonization of deceased servants of God.

**Ritschl, Ritschl, Albrecht,** German theologian: b. Berlin 25 March 1822; d. Göttingen 20 March 1889. He studied in the universities of Bonn, Halle, Heidelberg, and Tübingen, qualified at Bonn as a lecturer in 1846, became extraordinary professor of theology there in 1852, and ordinary professor in 1859. In 1864 he accepted a call to the corresponding chair at Göttingen. From 1874 he was a consistorial councillor. In his early thesis, 'Das Evangelium Marcions und das kanonische Evangelium des Lukas' (1846), he adopted the position of his master, F. C. Baur, but in the first edition (1850) of his 'Entstehung der altkatholischen Kirche' ('Origin of the Early Catholic Church') he showed signs of divergence, and the publication of the second edition of the latter work in 1857 marked his complete severance from the Tübingen school. His chief subsequent works are: 'De Ira Dei' (1859); 'Die christliche Lehre von der Rechtfertigung und der Versöhnung' ('The Christian Doctrine of Justification and the Atonement,' 3 vols. 1870-74; 3d ed. 1888-9), his chief work; 'Schleiermachers Reden über die Religion und ihre Nachwirkungen auf die evangelische Kirche Deutschlands' (1874); 'Die christliche Vollkommenheit' ('Christian Perfection,' 1874); 'Unterricht in der christlichen Religion' (1875; 5th ed., 1895), a succinct statement of his theological position; 'Geschichte des Pietismus' (1880-6); 'Theologie und Metaphysik' (1881); 'Drei akademische Reden' (1887); 'Fides Implicita' (1890); and 'Gesammelte Aufsätze' ('Collected Essays,' 1893 and 1896). Ritschl founded a school of theology still of much importance both in Germany and in other countries. Starting from a subjective theory of cognition, based upon the philosophy of Kant as developed in Lotze, he sought to eliminate the whole metaphysical element from religion. He was thus led to reject such doctrines as original sin, the Trinity, the incarnation, whether historic or mys-

tical, and the whole of natural theology, as of no religious value, and he denied the preexistence and miraculous birth of Jesus. He laid stress upon the historical character of Christianity, but held free views of inspiration, and admitted the most advanced criticism. His view of the atonement was essentially the same as the "moral influence" theory of liberal theologians. See the 'Life' by his son Otto (1892-6); Pfeiderer, 'The Development of Theology in Germany since Kant' (1890; German ed., enlarged, 1891); 'Die Ritschlsche Theologie kritisch beleuchtet' (1891); and Schon, 'Les Origines historiques de la Théologie de Ritschl' (1893).

**Ritschl, Friedrich Wilhelm,** German classical scholar: b. Thuringia 6 April 1806; d. Leipzig 9 Nov. 1876. He was educated at Leipzig and Halle, where he devoted himself to classical studies, and in 1832 was appointed extraordinary professor at Halle. He subsequently held professorships at Breslau and Bonn, and in 1865 accepted a call to Leipzig, where he remained until his death. His chief work is a critical edition of Plautus' Comedies (1848-54, incomplete; entirely remodeled edition, 1881-94). His other works include 'Parerga Plautina et Terentiana' (1845); 'Præcæ Latinæ Monumenta Epigraphica' (1864); 'Opuscula Philologica.'

**Ritson, Joseph,** English antiquarian: b. Stockton-on-Tees, England, 2 Oct. 1752; d. London 23 Sept. 1803. He studied law, became conveyancer in London and deputy high bailiff to the duchy of Lancaster. For many years he devoted his time to antiquarian researches and the editing of rare books, and he assisted Sir Walter Scott in preparing his work on the Border Minstrelsy. His works include: 'Observations on Warton's History of English Poetry' (1782); 'Ancient Songs from the Time of King Henry II. to the Revolution' (1790); 'Ancient English Metrical Romances' (1802); etc. Consult: 'Letters of Joseph Ritson, with a Memoir by Sir Harris Nicolas' (1833).

**Rittenhouse, Rit'n-hows, Benjamin,** American surveyor: b. Norriton Township, now Montgomery County, Pa., about 1740; d. Philadelphia 31 Aug. 1825. From 1776 to 1778 he was superintendent of a gun factory, maintained by the State of Pennsylvania. He sat in the Assembly of Pennsylvania from 1784 to 1788 and was appointed commissioner to survey the Schuylkill River in 1789. In 1792 he became associate judge of the court of common pleas of Montgomery County. His surveyor's chain made by order of Congress in 1796 has been the standard of the United States land office ever since. He was a brother of David Rittenhouse (q.v.).

**Rittenhouse, David,** American astronomer and mathematician: b. Germantown, Pa., 2 April 1732; d. Philadelphia 26 June 1796. His great-grandfather, Willem Rittinghuysen, a Mennonite, emigrated from Arnheim, in Holland, in 1688, and set up, on the banks of the Wissahickon Creek, the first paper mill in America. His mother, Elizabeth Williams, was from a Welsh Quaker family. When David was a small boy, the family moved to a farm in Montgomery County, and he lived the usual life of a country lad. From an uncle he inherited, when about 12, some books on calculation and geometry, and henceforth his life was determined. Mathematics and computation be-

## RITTER

came the passion of the boy and the absorbing interest of the man. To these should be added a great facility in mechanical invention and execution. In his teens he began to make clocks of wood and metal, and his father set him up in the business of maker of mathematical instruments and clocks. He is said to have independently discovered the method of fluxions or the calculus when but 19, and to have foreseen its vast utility, before he heard of the claims of Leibnitz and Newton. A friend, Rev. Thomas Barton, furnished him with linguistic and scientific works and his intense assiduity made him a scholar.

In 1763 his fame as an accurate worker in science gave him his first public employment. He was appointed to lay out on the ground the 12-mile radius around Newcastle, which forms the boundary between Pennsylvania and Delaware. This he did most accurately with instruments of his own construction, and Mason and Dixon accepted his results as final. In 1769 he located the point where the 41st parallel of latitude, the boundary between Pennsylvania and New York, strikes the Delaware River. His scientific activities were incessant. In 1769 occurred the transit of Venus, then supposed to be the most reliable means of determining the distance to the sun. Rittenhouse had read a paper before the American Philosophical Society, with computations of the time of ingress and egress, and the Pennsylvania legislature had appropriated £200 toward the observations. He built an observatory near his home in Norriton, and, in company with a committee appointed by the Society, made the most exquisite preparations for the occasion. Everything came off beautifully, and after it was over he fainted. His results were the best obtained in the world, and the computed parallax of the sun the most accurate then known.

He invented the plan of placing spider lines in the focus of his telescope, an arrangement that has done more to make accurate measurements possible than almost anything else of the kind. In 1770 he completed his famous orrery based on computations of his own. This showed the movements of the planets and moons in elliptic orbits around their primaries, the phenomena of eclipses, and the relative places of the members of the solar system over a time of 5,000 years preceding or following. For this he received £300 from Princeton University, and a like sum from the legislature of Pennsylvania as a testimonial to his genius for a second orrery for the University of Pennsylvania. The first one was injured by the British troops in the Revolutionary War.

Then followed computations of the orbits of comets, surveys of the land between the Delaware and Susquehanna for canal purposes, calculations for almanacs, surveys for a series of dams to make the Schuylkill River navigable, and various papers on astronomy for the Philosophical Society. His fame extended to Europe and many honors came to him, while he was looked upon with profound respect and pride by his countrymen who could appreciate his work. He was most modest and simple in his tastes, and if his life could have been spent in the pursuit of science, it was fondly believed that the American Newton had been found. But he conceived that his country called for

service in another field. He was engineer and finally president of the Committee of Safety of his state during the Revolutionary War, and plunged into military problems with all his energy. In 1776 he was made a member of the Assembly of Pennsylvania, the earliest under the reorganized Revolutionary movement, and was active in the creation of the new constitution, the first for the State of Pennsylvania. No one took a more prominent part than he. In 1777 and for 12 successive years, he was elected state treasurer. He was also trustee of the Loan Office. Throughout the war his time was taken up with administrative duties which he disliked, but faithfully performed.

After the war, about five years were expended in determining the boundaries of Pennsylvania. The five degrees along Mason and Dixon's line were ascertained by observations on Jupiter's satellites at each end with instruments made by himself. He was also engaged in running the western and northern boundaries of his State, and at the appointment of Congress, in 1787, the line between New York and Massachusetts. From 1779 to 1782 he was professor of astronomy in the University of Pennsylvania and afterward trustee and vice-provost of that institution. In 1792 he was made director of the United States mint by President Washington. After three years of service, he resigned and returned to scientific work. He succeeded Franklin as president of the American Philosophical Society in 1790. Degrees were conferred upon him by the University of Pennsylvania, by Princeton and by William and Mary, and the Royal Society of London made him an honorary member. "We have supposed," said Thomas Jefferson, "Rittenhouse second to no astronomer living; that in genius he must be the first because he is self-taught."

He was an ardent Republican. He allied himself with the strong Revolutionary party and with the anti-Federalists after the war. He was president of a society organized to sympathize with the French Revolution and was a loyal member of the party which later under Jefferson introduced the extreme democracy of the reactionary period which followed Federalism. Whether he was in fault or not in his political affiliations will be differently judged, but posterity can unite in admiration for the self-educated scientist of the highest type and for the lovable, honorable, sincere gentleman.

His publications, about 20 in number, appeared in the Transactions of the American Philosophical Society. The most popular was an Oration on Astronomy. An interesting 'Eulogium' was delivered after his death by Dr. Benjamin Rush. His life was written by his nephew, William Barton, in 1813, and by James Renwick in Sparks' American Biography. A discriminating account of him, by S. W. Pennypacker, was issued in 1882.

ISAAC SHARPLESS,  
*President Haverford College.*

Ritter, rit'ér, Frederic Louis, American musician and composer: b Strasburg, Alsace, 22 June 1834; d Antwerp, Belgium, 6 July 1891. He studied music at Paris with Georges Kastner, taught at the seminary at Fénétrange, Lorraine, and in 1856 came to America and settled at Cincinnati. Here he organized the Cecilia

(choral) and Philharmonic (orchestral) societies. Removing to New York in 1861 he became the conductor of the Sacred Harmonic and the Arion Choral Societies. The first musical festival of note held in New York was given under his direction in 1867. That year he assumed the duties of the professorship of music at Vassar College, which position he held until his death. He was a prolific composer of vocal music such as solos and choruses, among which were musical settings for several Psalms, 'O Salutaris,' an 'Ave Maria,' a group of Persian songs, and more than 100 German lieder. He also wrote works for orchestra and piano-forte and was the author of 'A History of Music in the Form of Lectures' (1870-4); 'Music in England' (1883); 'Music in America' (1883); 'Manual of Musical History' (1886); and 'Musical Dictation' (1888).

Ritter, Heinrich, hin'rin rit'ter, German philosopher: b. Zerbst in Anhalt, 21 Nov. 1791; d. Göttingen 3 Feb. 1869. He studied at Halle, Göttingen and Berlin from 1811 to 1815, and in the last named year the calling out of the volunteers led him to France. On his return he devoted himself exclusively to philosophy, especially in the department of history, in which he adopted the method and critical views of Schleiermacher. He qualified himself at Berlin as a university teacher, and from 1824 held an extraordinary professorship in that city until he accepted a call to Kiel in 1833, whence in 1837 he removed to Göttingen, where he continued to occupy the university chair of philosophy till his death. Ritter's best works belong to the history of philosophy, his first in this department being an investigation into the doctrines of Empedocles in Wolf's 'Literarische Analekten' (1820). His 'History of Ionian Philosophy' (1821); 'History of the Pythagorean Philosophy' (1826), and 'Notes on the Philosophy of the Megarian School' in the Rheinisches Museum, are models of historical investigation on the principles of Schleiermacher. His historical masterpiece is the 'History of Philosophy' (1829-33), which deals with general history up to the time of Kant. It was supplemented by a 'Review of the History of German Philosophy from the Time of Kant' (1853).

Ritter, Karl, German geographer: b. Quedlinburg, Prussian Saxony, 7 Aug. 1779; d. Berlin 29 Sept. 1859. He was educated at Halle, resided for a considerable time at Göttingen, in order to avail himself of its library, in 1819 succeeded Schlosser as professor of history at the Frankfurt Gymnasium, and in 1820 became professor extraordinary of geography at the University of Berlin, an office which he held with distinguished reputation for nearly 40 years. With Ritter may be said to have commenced a new epoch in geographical science; and a new department, that of comparative geography, claims him as its founder. His great work is 'Die Erdkunde im Verhältnisse zur Natur und Geschichte des Menschen' ('Geography in its Relations to Man's Nature and History'), the first two volumes of which appeared at Berlin in 1817-8, although it was afterward continued on a more extended plan, yet it was left incomplete, covering only Africa and Asia. It constitutes, so far as it extends, 19 vols. (1829-59), a vast repertory of valuable information rel-

ative to physical and general geography. Among other productions of Ritter may be mentioned 'Europa, ein geographisch-historisch-statistisches Gemälde' ('Europe Delineated Geographically, Historically, and Statistically,' 1807), and 'Die Stupas, oder die architektonischen Denkmäler an der indobaktrischen Königstrasse und die Kolosse von Bamyan' ('The Stupas, or Architectural Monuments on the Indo-Bactrian Highway and the Colossi of Bamyan,' 1838).

Ritual, in ecclesiastical usage, a manual containing the forms to be used by the priest in administering the sacraments, namely the communion (when given outside of the Mass), baptism, absolution, marriage and extreme unction; also in such rites as the churching of women, burial of the dead, blessing articles for religious uses, as water, candles, etc. The Roman Ritual now in universal use in the Latin Church was drawn up by order of Paul V., who, 1614, "counseled" all prelates to conform to its prescriptions exactly; but though the pope only counseled (*hortatur* is the word he employs in the bull *Apostolica Sedi*, a decree of the Congregation of Rites (1850) declares that the forms of the *Rituale Romanum* "affect the universal church." Before the issuance of the bull of Paul V. there were various ritual manuals authoritative in different countries or different episcopal jurisdictions. In the Eastern churches generally, as in the Greek Schismatic Church, the Ritual forms part of the general service book, the Euchologion, which corresponds to the Missal, the Pontifical and the Ritual of the Latin Church. The ritual of the Anglican Church is contained in the Prayer Book under the heads "Ministration of Baptism," "Order of Confirmation," etc.

Ritual of the Dead, one of the service books of the Roman Catholic Church in which are contained the prayers and the order of ceremonial used by that church in the administration of the sacrament and in certain other offices. The ritual occupies much the same position to the priest as the *Pontifical* does to the bishop. These directions are contained, in the case of the Anglican Church, in the Book of Common Prayer; in the Greek and some of the other Eastern churches the ritual is a part of the general collection. The Roman Catholic ritual now in use was made under the direction of the Council of Trent (Dec. 1545 to Dec. 1563), the need being felt for a unified ritual, to replace the various versions then in use. In 1614 Paul V. published an authoritative edition. This was often reprinted, and was revised and reissued by Benedict XIV. See BOOK OF THE DEAD.

Ritual Law, that portion of the law of Moses which prescribes the ceremonies of public religious worship, the manner of making trespass offerings, the procedure for the discovery of leprosy, for the purification of women after childbirth, the discrimination of things clean and unclean, etc. The ritual laws of the Hebrews are contained mostly in the books Exodus, Leviticus, Numbers and Deuteronomy.

Ritualism, a term designating the practices of a party in the Church of England and the Episcopalian Church in the United States and elsewhere, in surrounding the public worship with a variety of rites and ceremonies, and in

resuscitating certain features and usages of the Catholic Church in pre-Reformation times, such as the use of ornate eucharistic vestments, use of the sign of the cross, belief in the "Real Presence," prayers for the dead, treating the communion service as a real sacrifice, auricular confession, and many other beliefs and practices usually esteemed by Protestants as the insignia of "Romanism." By many, ritualism is held to be only another name for Puseyism and Tractarianism; but Dr. Pusey, at least, the reputed father of Puseyism, never adopted any of the practices of ritualism. The Ritualists defend their position against the charge that it is nothing but a revival of "Romanism" in the Protestant Church and that it is flagrantly inconsistent with the simplicity of Christian worship as portrayed in the books of the New Testament, by saying—what is undoubtedly true—that not all authoritative regulation of ritual is laid down in the New Testament, and that what is obligatory in ritual is to be learned from apostolic tradition. They allege, in explanation of the simplicity of primitive Christian worship, the secrecy and restraint to which the church was subjected through the ages of the persecution. All through that time the apostolic tradition was preserved by the church: on the accession of Constantine the ritual of the church assumed its natural beauty and proportions. And they cite the Anglican Book of Common Prayer in its original form as promulgated in the second year of Edward VI. (1549) as authorizing most of the practices now condemned by Protestants as ritualistic and "Romish." Their contention that the Episcopalian Church of England, with its daughter churches, is historically committed to the practices for which the Ritualists are censured, need not be considered here: it will suffice briefly to state some of the peculiar rites and usages which distinguish the Ritualists from the mass of Protestants whether in the Episcopalian or other churches. The Ritualists hold that the "altar" is a necessary part of Christian worship: the Book of Common Prayer, in the "order for the administration of the Lord's Supper," carefully avoids the word "altar" and says always "table." The Ritualists revived the practice of auricular confession and set up in their churches confession-boxes as in Roman Catholic churches. They brought back into use the eucharistic vestments—dalmatic, chasuble, cope, etc. The Puritans held the cross an abomination: the Ritualists set it on top of their churches and in the centre of the altar—and not only the cross but the crucifix. They restored also the use of incense in divine worship; and at the celebration of "the Mass" as they do not hesitate to call what in the Prayer Book is "the Lord's Supper" or "Holy Communion," they keep candles burning, as in Roman Catholic churches, even though the sun may be at meridian. And, what is more significant still, the Ritualists pay formal adoration to the "Real Presence" of Christ's body and blood, believed to underlie the species of bread and wine.

**Ritualist**, one who is zealous for strict observance of ritual; in particular, one who advocates the use of the rites of Catholic worship in the Established Church of England or in the Episcopalian churches which derive from the Church of England. See **RITUALISM**.

**Rivarol, Antoine**, *litwân rê-vâ-rôl*, French satirical and political writer: b. Bagnols, 26 June 1753; d. Berlin 11 April 1801. He was one of the celebrated wits of the 18th century, possessing distinction, elegance and an astonishing facility in the expression of his thoughts that early gave him a position in the salons and at the court of Paris. His first work, which obtained a prize at the Academy of Berlin, was 'Discours sur l'Universalité de la Langue Française' (1784). The same year he published a translation of Dante's 'Inferno.' Later appeared 'Lettres à M. Necker' and in collaboration with Champcenetz, 'Petit Almanach des grands Hommes' (1788), a satire on the authors of his day. Becoming an émigré in 1792, he lived at Brussels, London, Hamburg and finally at Berlin, his works at this period being 'Lettres au Duc de Brunswick'; 'Lettre à la Noblesse Française' (1792); 'Vie politique et privée du Général La Fayette' (1792); also a preliminary discourse to a French dictionary (1797). In 1828 was published under his name a dictionary of the French language which was not written by him. His collected works were edited by Chénedollé and Fayolle in 1808.

**Rivas, rê-vâs**, Nicaragua, a town between Lake Nicaragua and the Pacific Ocean, slightly northwest of the surveyed route of the Nicaragua Canal, and on the high road to Granada. It occupies the site of a Nicaraos Indian village. Pop. 6,000.

**Rivé-King, rê-vâ-king**, Julie, American concert pianist: b. Cincinnati, Ohio, 31 Oct. 1859. She is the daughter of Léon and Caroline Rivé, the latter a musician and her first teacher, and was married in 1878 to F. H. King. She appeared first in concerts at the age of six. Later she was a pupil of Liszt. She has appeared in over 200 concerts with Theodore Thomas and 80 with Seidl, besides in many independent recitals. She ranks among the foremost solo-pianists in America.

**River Dolphins**. See **POBORNS**.

**River Falls, Wis.**, city in Pierce County; on the Kinnickinnick River, and on the Chicago & Northwestern; about 60 miles in direct line west of Eau Claire and about six miles from the Mississippi River. It was settled in 1850 by a colony from New York, incorporated in 1856 and chartered as a city in 1885. It is in a productive agricultural region, in which wheat is the principal crop. The chief manufacturing establishments are flour mills, wagon works, and starch factory. The trade is mostly in grain, flour, and vegetables. The principal public buildings are the six churches and the schools. River Falls is the seat of a State normal school, and a high school, and has two graded schools. The bank has a capital of \$25,000. The government is vested in a mayor, elected biennially, and a council of six members elected annually. The city owns and operates the waterworks, and the electric light plant. Pop. (1890) 1,783; (1900) 4,503; (1910) 1,991.

**River-hog**, one of the African wild swine of the genus *Potamochoerus*, separated from the typical pigs (*Sus*) by the existence of a horny outgrowth from a bony protuberance above the canine in the male. This has been compared by Beddard to the osseous horn-cores of the extinct *Dinoceras*. Five species are recognized, one in

## RIVER-TERRACE—RIVERS

Madagascar, and the others in South and West Africa. The best known are the gray boar-bark or bush-pig (*P. africanus*) of Cape Colony, and the red river-hog (*P. porcus*) of the West Coast, remarkable for its vivid rufous coloring and long penciled ears. These pigs lead a half-aquatic life along the marshy borders of sluggish streams and in dense forests, but do great damage to the native plantations in some parts of the country, whence they are constantly killed off. Consult 'Proceedings' Zool. Soc. London, 1894, p. 92.

**River-terrace.** See TERRACE.

**Rivera, José Fructuoso, hō-sā'** frook-too-ō'sō ré-vā'rā, Uruguayan soldier and politician: b. Paysandu, Uruguay, 1790; d. Montevideo, Uruguay, 13 Jan. 1854. He fought in the numerous civil wars, rose to leadership, and when Uruguay established her independence became in 1830 first president of the republic. In 1835 he was succeeded by Oribe, and in 1836 headed a revolt against the president, which resulted in a civil war of two years' duration. Oribe was forced to resign, and in 1838-42 Rivera again served as president. In the latter year, Oribe, aided by the Buenos Ayres dictator, Rosas, invaded Uruguay, and in 1843 began the famous nine years' siege of Montevideo. Rivera moved to meet him in the field, but in 1845 was defeated at India Muerta by Urquiza, an ally of Oribe. In 1853 Rivera aided Flores in deposing the recently elected president, Giro, and later became a member of the executive triumvirate.

**Riverhead, N. Y.,** village, county-seat of Suffolk County; on the Peconic River, at the head of navigation, and on the Long Island railroad; 67 miles east of New York. The village was first settled in 1690, and its growth during the first century was slow; in 1729 it was made the county-seat. During the War of 1812 a skirmish between men from some British vessels and the American militia took place near the village and within the limits of the township. It has a variety of industrial establishments, including grist mills, a woolen mill, planing and molding mills, carriage works, soap factories, and an organ manufactory. It contains the county court-house, the agricultural fair buildings and grounds, and has a high school with a school library. Pop. (1890) 4,010; (1900) 4,503; (1910) 4,706.

**Rivers** (Fr., *rivière*; Span., *ribera*; It., *rivera*; Lat., *riparius*, from *ripa*, bank, of or belonging to a bank), bodies of water of considerable size flowing with perceptible currents in definite channels, and usually without cessation during the year. Some water courses are designated as rivers although their beds are dry a part of the year. Rivers, obeying the laws of gravity, their waters seek the lowest level and eventually reach the ocean. The regions having rivers which do not flow into the ocean either directly or indirectly are parts of the earth's surface where the evaporation is so great that no overflow of water results from precipitation. Usually the overflow of a river discharges into another river, and perhaps a second or even a third discharge is made before the waters reach the sea. The Republican River of Nebraska and Kansas flows into the Kansas River in the State of Kansas, and the Kansas River

flows into the Missouri, the Missouri into the Mississippi, and the Mississippi into the Gulf of Mexico, which last discharges its waters into the Atlantic Ocean through Florida Strait and Yucatan Channel.

**Origin.**—Rivers are usually formed by springs or the gradual melting of the ice and snow which perpetually cover the summits of all the most elevated ranges of mountains upon the globe. Springs and ice are themselves due to the precipitation of water from the atmosphere in the form of snow, rain, mist, or dew. These fill the springs, lakes, or other reservoirs from which rivers flow by the natural gravitation of water to a low level. The union of various springs, or of these meltings, forms rivulets; these last follow the declivity of the ground, and commonly fall at different stages into one great channel called a river, which at last discharges its waters into the sea or some great inland lake. A new made river at first usually flows over the surface until it has worn itself a channel; or it may follow some depression or deformity in a mountainous region. Rivers are swollen during their course by the rain which falls on the surface. In temperate climates the source of supply tends to greater equality in the volume of the river than in torrid regions, where the evaporation is great. In the former the rains are not only more equally distributed in point of time, but also from a more protracted source of supply; part of the rainfall sinks into the ground and forms springs, part forms rills which flow directly into the river, and part feeds those rills with the drainage of the saturated ground long after the rain has ceased. As mountainous regions abound in springs, most rivers commence from a chain of mountains; each side of a chain also has its springs, and the rivers which originate on one side flow in the opposite direction to those which rise on the other. As it is the property of water to follow the most precipitous descent that comes in its way, the courses of streams point out the various declivities of the earth's surface, and the line from which large rivers flow in contrary directions generally marks the highest parts of the earth. This line need not, however, be of any great height; in European Russia, for instance, where the rivers are very extensive, the line which separates their sources is very little above the level of the Baltic or of the Black Sea.

**Changes in Form and Size.**—As soon as the stream begins to flow, its channeling and the deepening of its trough commences. If no obstructions prevented, the water would go on enlarging the channel, by widening and deepening. The nature of the soil, the softness or hardness of the rocks along its course, the amount of sediment it carries in its waters, and where this sediment is deposited all contribute to change of form and size. The erosive action of rivers on their beds is continually exercised, especially in the early part of their course; where the channel broadens as they approach the sea it may almost cease. Remarkable instances of erosive action are almost everywhere to be observed; but in no case is such action more striking than in the cañons or river-gorges in the Colorado region of the United States. There the rivers have hollowed out for themselves channels that present almost perpendicular rock walls on either side rising to the

## RIVERS

height of 6,000 feet for hundreds of miles. Such action is also seen where there is a waterfall, in which case the water gradually wears away the rock at the place where the fall occurs, and thus causes the latter to recede, as Niagara Falls. In perhaps every case a river has had much to do with the formation of the valley in which it flows. Rivers are very permanent features in the earth's history, and in some cases have hollowed out a channel through a mountain range gradually elevated across their source.

The size of a river depends upon two main circumstances,—the extent and character of its drainage area, and the degree of humidity possessed by the climate of the region from which it draws its supplies,—the latter being often dependent upon prevalent winds blowing from the ocean. The peculiar position of the Andes Mountains with respect to the rest of South America, the fact that by very far the largest proportion of its running waters are drained off in one general direction, toward the Atlantic, and the humidity of the climate, all contribute to the immense size of the rivers. The Andes being placed so near the coast of the Pacific, the rivers which flow into the Pacific Ocean are small; while those which flow on the other side, having such an immense space to traverse, are increased into a vast volume before they reach the Atlantic. The physical conformations of some continents are unfavorable to the accumulation of such vast bodies of water as the rivers of South America. Europe is not of sufficient extent; Africa has a climate which causes rapid evaporation and abounds in sandy deserts. A large part of Asia has not the humidity of the Amazon region, and its vast interior lakes serve as receivers for some of the large streams. The arrangements of its mountains conduce to long and somewhat narrow drainage areas. As the river goes on from year to year, in most cases it cuts a trench below the original constructional channel, and in time forms what is called a consequent valley. By means of the new constructional troughs many of the constructional lakes and the rivers become continuous streams, that increase the length as well as the depth of the channel. Where the waters pass from a hard to a soft rock, or from a resistant to a weak part of the material through which it is channeling, a greater slope is formed making rapids (q.v.) or falls (q.v.) or cascades (q.v.). The angle of the slope depends upon the difference in the degree of resistance of the hard rock in the old channel as compared with the soft rock in the formation channel. Gradually the channel is cut down close to the sea-level or base-level, and its course is over a gentle, gradual slope. The depth of the channel depends upon the dryness of the climate, softness of the rock, height of the land, and the volume of the stream. The dry climate really lessens the volume of the stream, and consequently it cannot force its way with the rapidity of a stream with greater volume even if the widths of the channels are equal. The river flowing through a region of hard rock will cut a deeper valley in a given time than the river of the same size and volume flowing through a region of soft rock; the latter will have a mass of detritus, an accumulation of waste from the weak rock, and it will need a vast volume of water or a steep

grade to do the same amount of channeling as the first mentioned river. Rivers flowing over comparatively low land, with drainage areas not much above the base-level have shallow channels, as in the southeastern part of the United States, especially in Florida. A river with a large volume of water has more power to carry off sediment, and even where the slope is gentle its momentum is greater than in that of the stream of a small volume of water. There are two causes for the shallow channels of the long rivers of the plains east of the Rocky Mountains; the dryness of the climate and the soft rock material through which they pass.

After a river has cut its channel to the base-line, then its grading really begins, the inequalities gradually disappear, or would disappear if there were no obstructions to the regular work. The constructional lakes and the waterfalls gradually disappear. The constructional lakes may disappear, but if the amount of detritus is large the channels lower down a stream, with a slight grade, may be filled, and thus the water will flow over a bed elevated above what was once its channel. Such channels exist in Ohio and in the plains of Lombardy. Any change in the depression or uplift of the land, whether from volcanic or other causes, will cause some change in the river. In various parts of Europe and the eastern part of North America, rivers have changed because of increase of evaporation, caused by the continued deforestation of their basins. New rivers often appear in the drainage area of a well defined river. There are several causes for this change; the consequent valley formed by the original stream will, in places, have a weak rock-mass through which the water will break and a lateral channel or ravine will be formed. The valleys formed by such streams are called subsequent valleys and the streams themselves are called subsequent streams.

The main stream with all the lateral streams and all tributaries, whether lakes or rivers, is called a river system. The land drained by a river system is called its basin. The system is usually known by the name of the main stream or trunk.

The rate of fall of many of the large rivers is not great. The Amazon has a descent of only  $10\frac{1}{2}$  feet in 600 miles of its course—that is, one twenty-seventh part of an inch for every 1,000 feet of that distance. The Loire, in France, between Pouilly and Briare, falls one foot in 7,500 feet, but between Briare and Orleans only one foot in 13,500 feet. Even the rapid Rhine has a descent of no more than four feet in one mile between Schaffhausen and Strasburg, and of two feet between the latter place and the borders of Holland. The glaciers in France show a change in volume, and a consequent change in the size and rate of fall of the glacier-fed rivers. See **NIAGARA FALLS**; **WATERFALLS**.

*Watersheds or Divides.*—The line which separates the waters which flow into different rivers or different systems is called the watershed or the divide. The continental divide in the United States is the line which parts or separates the streams which flow into the Pacific from those which flow into the Gulf of Mexico through the Mississippi. Divides change from various causes. The subsequent rivers sometimes take the water from one system to

## RIVERS

another. The gradual removal of a constructional lake may change the divide, as in New York State, between the Mohawk River and Lake Ontario, in the Northwest between the Red River of the North and the Mississippi. The divides in many places are very low, as between the Amazon and Orinoco, and the Amazon and the Paraguay. The Orinoco at some distant period reached the basin of the Amazon, and has been subsequently connected with it through what is now an important branch, the Cassiquiare, which after a course of 120 miles from the main river discharges itself into the Rio Negro, a branch of the Amazon; and as the navigable waters of the Amazon approach within three miles to those of the Paraguay, there is with only this interruption a continuous communication by navigable rivers from the mouth of the Orinoco, in lat. 9° N., to the mouth of the Paraguay, in lat. 35° S.

**Flood-Plains.**—For various reasons many rivers overflow their banks at annual periods, others at irregular intervals. Such rivers usually carry a large amount of silt which at the time of an overflow is deposited on the land, thus enriching it. Great damage sometimes results from this overflow (see *LEVEES*, *MISSISSIPPI*), and various means have been devised to protect the lands adjacent to such rivers from inundation. The flood-plains of the Nile are noted for their fertility; the Mississippi, Amazon, Ganges, and many others have extensive flood-plains. The large rivers of Siberia have vast flood-plains caused by the thaws at the sources of the rivers when the lower portions are closed by ice. The descending waters sweep over the frozen surface carrying with them vast quantities of soil, detritus, and even forests. The Mackenzie in North America has flood-plains from the same sources as the Siberian rivers.

**Mouths of Rivers.**—The river which enters the ocean may have its channel submerged and the mouth becomes an estuary, or the tidal wave may crowd back its waters and the mouth becomes a sord. In either case there is a constant battle for supremacy between the fresh water from the land-mass and the salt waters of the sea. Some of the sediment of the rivers is brought to the sea and either carried out into the ocean or deposited at the mouth of the river, where they form deltas. In some cases, as the Mississippi, the delta grows rapidly, extends out into the sea and becomes a part of the land-mass. The sediment annually brought down the Mississippi has been estimated as equal to a deposit of a foot in thickness over 12 square miles. The waters of the Ganges and Brahmaputra come more highly charged with sediment on account of their more rapid descent and the more violent rains that fall about their sources, and their deposits exceed many times those of the Mississippi. The sediments are spread out to a distance of 100 miles or more from the land, the waters of the Bay of Bengal being discolored by them even at this great distance. The quantity annually discharged from the mouth of the river has been computed equal to a layer one foot thick over a tract of 225 square miles. The Nile has a vast delta. The Mississippi, Nile, Ganges, Po, and many other rivers enter the sea by several channels. The Amazon enters by only one large channel, divided by an island, but the river widens out into a bay 180 miles wide. The delta-lands are

very fertile, and where the river channels have assumed stability, deltas have become valuable additions to the land-mass.

**Economic Relation of Rivers.**—The effect rivers have in supplying moisture to the adjacent lands, either by natural or artificial (irrigation) means is recognized by all nations. Their uses as contributing to the healthfulness of the climate and to modifications of temperature are well known. In the early history of all the nations on the globe, the waterways were the great thoroughfares which furnished means of intercommunication, and the rivers were largely instrumental in determining the location of the great commercial and industrial centres of the world. The great rivers of Europe and Asia, such as the Rhine, Danube, Volga, Indus, Ganges, Brahmaputra, Yangtze, and Ob, afford access to the sea to enormous populations. The Amazon, with its plain track extending for nearly 3,000 miles, is in many ways less like a river than a fresh inland sea; but the Mississippi and Saint Lawrence, though less extensive, are of greater value for carrying sea traffic to inland places. In their upper valley tracts, rivers are of use chiefly for transporting lumber and driving machinery. It is interesting to note that in Switzerland, Norway, and Sweden, where there is no coal, there exist exceptional facilities for the use of water power on account of numerous mountain torrents.

### LAW OF RIVERS.

**General.**—In law a body of water having a uniform current is generally termed a river. It consists of the bed, the water, and the banks or shores according as the stream is non-tidal or tidal. The law applicable to rivers and their use depends upon the country having jurisdiction over them. In the United States the use of navigable rivers is regulated by the laws of the United States, and by the legislatures of the States through which they flow. No general statement that is applicable to all streams, and which governs the use of all streams, can be made, and navigable and unnavigable rivers are not always subject to the same rules. In the United States, in the most approved and important sense of the term, navigable waters include all those having a channel which is useful for commerce. Such waters are public highways by common right. It has been said in construing the common law and in some of the earlier decisions of the courts that by navigable waters are meant all those in which there is a flow or re-flow of the tide. This definition may have been proper in England where there is no river of any considerable importance which has not a flow of the tide, but it would be unreasonable, in fact it cannot be applied in the United States where there are large rivers like the Mississippi, the Ohio, the Allegheny, the Delaware, the Hudson, the Schuylkill, the Missouri, the Columbia, and others that are very important for the purposes of navigation, and over which large business interests are transacted. To be navigable rivers, in the legal sense, commerce must be carried on over them which is of a valuable character. It is not necessary, however, that this commerce be carried on by means of boats; waters over which valuable commerce can be carried on are public highways for the purpose, even if they are used only for floating logs and rafts. Most of the authorities in America limit

## RIVERS

the term navigable waters to waters having an inherent capacity for navigation. Whether a river is navigable or not is generally a conclusion of fact and can be established by proof; but the courts in some States take judicial notice of the fact that some streams are navigable. In common law a distinction was made between waters navigable in law and those navigable in fact; those navigable in law being tide waters. The term is still used in this sense in England. By the civil law, waters that are in fact navigable are such in law, and a navigable river is defined as a *statio itmere navigio* (a place or way for navigation). In the development of American law the tendency of the courts has been toward the adoption of the civil law doctrines. Among navigable waters are two classes, termed Public and Semi-Public. The basis of classification is ownership. In public waters the soil beneath them is common property. The public have the right of navigation and all rights incident to ownership. Among them are fishing, gathering ice, sea-weed, sand, gravel, etc. All tide waters, including the sea and its arms and tidal rivers, belong to this class, and in many of the States all fresh-water rivers and lakes which have a capacity for valuable floatage are public. The non-tidal waters and the soil under them are private property, although the interest of the owner is qualified by being subject to the right of the public to pass over them.

**Jurisdiction.**—The right of navigation is subject to the control of the government, and the government has the right to improve rivers and harbors. In England this power was vested in Parliament. In the United States the authority of Congress under the commercial clause of the Constitution is paramount. In the absence of Congressional action, the power of the State legislatures is supreme; they may direct the improvements of navigable rivers, and may authorize improvements by individuals and by private corporations, and may levy tolls. Waters which lie within the borders of different States are generally subject to the concurrent jurisdiction of the States. The territory of States and nations when bounded by rivers, extends, unless otherwise agreed upon, to the centre of the streams.

**Public Easement of Passage.**—The public have the right of passage over all streams which have a capacity for that purpose, and this includes the right of navigation in boats and vessels, and of floatage as in the case of rafts and logs, and of travel over the ice. In common law the right to navigate waters above the tide was acquired by using the same. Now it may be granted by express act of legislature, but it is generally regarded as an inherent public right needing no legislative sanction. The legislatures of the States having jurisdiction, and Congress may make rivers and streams public highways for particular purposes when they are not public highways or navigable for other purposes. For instance, the Legislature may make a river a public highway for the purpose of floating logs, although it cannot be navigated by boats or vessels.

**Use of Banks and Shores.**—By the civil law the public have the right to use banks and shores of navigable rivers as appurtenant to the right of passage, and this is true of the States where that system prevails; but under the

common law the right to use the shores and banks by navigators was limited to high water mark and the right to pass over the waters does not include the use of banks for general purposes. But the public have the right of anchoring and of mooring on the banks against all except the owners of the banks. There is no public right at common law of towing on the banks. The owners of stranded property may go upon the banks for the purpose of taking it. In the use of rivers for navigation, the boats going down stream have a right to the centre of the stream or the centre of the current, and those going up stream must keep to the sides in passing. A descending boat may keep to the shore, but if she meets an ascending boat hugging the same shore and signaling her intention of keeping the shore, the boat going down stream must keep to the middle of the river. The rule is for the protection of vessels navigating up and down rivers crowded with boats to hold to the centre as nearly as possible. The rule both of statute and the general laws of navigation, which requires steamboats approaching one another to turn to the right applies to steamboats crossing a river, and ferry-boats crossing rivers making frequent trips, are obliged to use great care to avoid other sailing craft. Steamboats must keep out of the way of barges and flat boats floating down the river guided only by oars.

**Rivers not Navigable.—Rights of Owners.**—When a river that is not navigable forms the boundary of property, one half usually belongs to one proprietor and the other half to the other, the centre of the stream being the line between the owners of the lands on each side, and when the land on both sides belongs to one owner he is then the owner of the whole bed of the stream. This rule of law refers to the land under the water, and it is the property of the riparian owner as much as the banks of the river. The owner of the land has not an absolute ownership of the water, but he can use it for necessary purposes, as for the use of his family and house and to water his stock. If he takes more than the usual quantity and for such purposes as are not necessary, he is liable for damages to riparian owners farther down the stream in case they suffer damages. One owner of the land cannot change the bed of the stream to the injury of other owners; but if the line be changed slowly by accretion at one side, the line of ownership will still follow the centre of the stream. The rule might be different if, for any unforeseen and uncontrollable cause, the stream should burst its banks and make a new channel in a different place.

**Fishing.**—Each riparian owner has the right to fish in the waters on his own side of the river, subject to the fishing laws. It is customary, however, for owners of opposite sides of rivers to allow each to fish in the whole stream, for the convenience of both parties. Where the river bed is owned by the public and the river is navigable any person has a right to fish.

**Accretions.**—The owner of the land along the side of and under a river has the right to all deposits of alluvium along and upon his land. If an island is formed by accretions in an unnavigable stream, the ownership will be determined by the *filum aquarum*, or centre of the stream, and it will belong to the parties owning

## RIVERS

the land on the side of the line on which it is formed. If the island is on the line, each will own his proportionate share.

**Bridges.**—Congress has power to authorize the erection of bridges over navigable rivers; the power may be exercised and authority given even when the bridges obstruct to a certain extent the free navigation of the rivers. States also have power to authorize the building of bridges over navigable waters within their boundaries, although they may to a certain extent interfere with navigation. This power in the States, however, is subject to the exercise of the power of Congress to regulate navigation. The proposition has come to be recognized as not disputable that but for the power granted by the Constitution to Congress, the State Legislatures would have as full and entire control of the waters of their several States as they have over the land. The States reserve all power not granted to Congress. The sovereignty over the waters of the States vests in Congress and in the several State Legislatures. Congress and the State Legislatures can provide for the erection and maintenance of draw-bridges over navigable rivers, and provide for the safe passage of vessels in the draws.

**Boundaries.**—When land along the bank of a river is described as being bounded on the bank or shore instead of the centre of the stream, then low water mark on the shore will usually be the boundary line. Where land is bounded by a common law navigable stream, that is, one in which the tide ebbs and flows, the boundary is the high water mark on the shore, and in some States in which there are large rivers that are navigable, although the tide does not ebb and flow, the boundary line is held to be low water mark. The proprietor has a right subject to government supervision to erect wharves and piers extending to low water mark or into the channel of the stream. In deciding what is low water mark, the ordinary rise and fall of the water is taken into account. There is not a unanimity of legal opinion in all the States upon the subject of the ownership of the beds of streams.

**Dams.**—The owner of land on both sides of a stream not navigable may erect a dam and swell the water of the stream or form a pond up to the line of the land of the next owner up the stream. An owner of but one bank cannot, without permission, erect a dam beyond the thread of the river. The erection of dams has been encouraged by the legislatures in many of the States on the ground of public policy. The right to erect dams has been given to riparian owners even when they flow the lands above them, and in some cases permission has been given to riparian owners to erect dams across the stream, although they owned land only upon one side. In these cases the statutes authorizing the erection of such dams have provided the method of assessing and collecting damages. Riparian owners on navigable streams, whether navigable by nature, or declared to be public highways by the legislatures of the States through which they flow, cannot erect dams across such streams without permission of the legislature having jurisdiction, or Congress. This permission is granted in some States by general law, and in others, as in New York, by special laws. The legislatures in granting permission to erect dams always

provide for ordinary navigation and for the maintenance of fishways. The right given by legislatures and by Congress to erect dams is not a protection against injuries to private owners. Such owners have a right to collect damages.

**Ferries.**—A ferry franchise is a right to transport passengers and property across a stream and to land at a particular place on its bank. In the United States this right is established by legislative authority. It is the creature of a sovereign power and no one can exercise it without the consent of the State. It is within the control of the government. In England the right was granted by the Crown, or founded upon prescription. A ferry franchise is real estate and can be sold like any other real estate.

**Fishing.**—Ordinarily any person may take fish out of navigable streams if he can do so without trespassing upon the lands of private owners. In most of the States of the United States as at common law, the exclusive right to fish is in the owners of the banks of rivers that are not navigable unless otherwise appropriated by statute. This right, however, is subject to legislative control. The preservation of fish in the waters of a State is of such public concern as to fall within the domain of legislative power. No owners of land have the right to obstruct the free passage of fish up and down the streams. The legislatures have the right to regulate the taking of fish from private rivers, which are unquestionably private property.

**Floods.**—Riparian owners who collect water on their land must keep such water under control at their peril, and dams erected for the purpose of confining water or creating ponds, must be constructed with such care and skill as to make them capable of resisting usual and ordinary floods.

**Ice.**—Water congealed is ice. Ice formed upon private waters, and that includes rivers owned by individuals, is real estate and is the property of the owner of the soil over which it is formed. In some of the States, however, as in Michigan, it is held as personal property and can be sold as personal property. After it is cut and removed it is always personal property. The owners of land bordering upon navigable streams in States where they are held to be public property, have no title to the ice which forms on such streams; such ice belongs to the first person who appropriates it, but generally ice forming upon private fresh-water streams belongs exclusively to the riparian proprietors and they may prevent others from removing it and maintain trespass against those who cut it without permission.

**Irrigation.**—The right to take water from streams passing over land owned by individuals is regulated by law, and differs in different States. The right, however, is generally recognized that there may be a reasonable appropriation, but no total diversion of the water.

When the State or the government intervenes and takes control of rivers for the purposes of irrigation, then the streams are to be used according to the laws enacted for the purpose. This is so as to the use of all rivers that can be used for the general good of the public. The courts have jurisdiction over questions arising out of the use of rivers. The United States admiralty courts have jurisdiction

## RIVERSIDE—RIVINGTON

tion over causes of action arising in the large rivers as they do in the Great Lakes and the sea and coast waters.

**Bibliography.**—Lawson, 'Geography of River Systems'; Napier, 'Lakes and Rivers'; Ruffner, 'Non-Tidal Rivers of the United States'; Russell, 'Rivers of North America'; Wheeler, 'Tidal Rivers'; Morrill, 'Floods of the Mississippi River'; Edward, 'Thousand Miles up the Nile'; Keller, 'Amazon and Madeira Rivers.'

**Riverside, Cal.**, city and county-seat of Riverside County: on the Santa Fe, Southern Pacific, and Salt Lake R.R.'s; about 60 miles east of Los Angeles. It was founded in 1870 by settlers largely from the New England States and New York, and was incorporated as a city in 1886.

Riverside is famous as the largest citrus producing and shipping point in the world, the annual output of the citrus fruits in Riverside County being over 8,000 cars, of which something over 1,000 cars are lemons, the balance being oranges (nearly 6,000 cars of this fruit are shipped from the city of Riverside alone). There are about 40 packing houses in the city where oranges and lemons are shipped, employing over 1500 persons at the height of the season. Alfalfa and deciduous fruits are also successfully grown, and there is a large grain-producing area in the county.

Riverside has one of the most extensive and complete irrigation systems in southern California. The climate is remarkably healthful and the place is famous as a health resort. The architecture of the public buildings has been largely developed along Mission lines, and among the famous buildings of this character are the Glenwood Hotel, the Carnegie library and the high school building. The courthouse is a single-story building built along classic lines, all on the ground floor, and cost \$250,000. Riverside is the seat of Sherman Institute, a United States Indian School, which has over 600 pupils.

There are three banks with a combined capital of \$250,000, and deposits of about \$3,000,000. The government of the city is vested in a board of trustees of five members, two chosen at one election and three at the next, elections occurring every two years. Pop. (1910) 15,212.

E. P. CLARK,  
Editor 'Daily Press.'

**Rives, révz, Alfred Landon**, American engineer, son of William Cabell Rives (q.v.) and father of Amélie Rives: b. Paris, France, 25 March 1830; d. 1903. He was educated at the University of Virginia and at the Ecole des Ponts et Chaussées, Paris, where he was graduated in 1854. He was assistant engineer in completing the Capitol at Washington, was engaged on the aqueduct there, and later was in charge of the United States survey for improving the Potomac River. He was colonel of engineers in the Confederate army during the Civil War, and was afterward manager of various railways and engineering enterprises.

**Rives, Amélie.** See TROUBETZKOY, A. R.

**Rives, Hallie Erminie**, American novelist, b. Christian County, Ky., 2 May 1876. She has published: 'Smoking Flax' (1896); 'As the Hart Panteth' (1896); 'A Furnace of Earth' (1900); 'Hearts Courageous' (1902); etc.

**Rives, William Cabell**, American legislator and diplomat: b. Nelson County, Va., 4 May 1793; d. near Charlottesville, Va., 26 April 1868. He was educated at Hampden-Sidney and William and Mary colleges, studied law, and in 1816 was a member of the Virginia constitutional convention. In 1817-19 and in 1822 he served in the State legislature, and in 1823-9 was a member of Congress. He was minister to France in 1829-32, and in that capacity negotiated the treaty of indemnity in 1831. He served in the United States Senate in 1832-4, 1835-45, and in 1849-53 was again minister to France. He was a member of the peace conference at Washington in 1861, and after the secession of the South sat in the provisional congress at Montgomery, Ala. He published 'Life and Times of James Madison' (1859-69).

**Riveting Machines.** See METAL WORKING MACHINERY.

**Riviera, ré-vé-à-râ**, a district bordering the Mediterranean coast, partly in France, partly in Italy, with Genoa as its central point. It extends to Spezzia on the east and Nice on the west, and is a favorite winter resort of invalids and others. The whole coast is traversed by a road and by a railway.

**Rivière, ré-vé-âr**, Briton, English painter: b. London, England, 14 Aug. 1840. He studied art under his father, a drawing master, worked at illustrating for many English and American publications and exhibited at the Royal Academy for the first time in 1864. He was elected A. R. A. in 1878, and R. A. in 1881. Among his most notable pictures, many of which have been engraved, are: 'Strayed from the Flock'; 'The Lost Sheep'; 'Legend of St. Patrick'; 'An Anxious Moment'; 'Circe'; 'Giants at Play'; 'Actæon'; 'Væ Victis'; 'Rizpah'; 'A Fool and His Folly'; etc. He is also known as a sculptor by his 'Anatomical Lion' (1888); 'A Dying King' (a lion, 1894); and 'The Last Arrow' (a lion-hunting scene, 1896).

**Rivière du Loup, ré-vé-âr dû loo.** See LOUISVILLE.

**Rivington, James**, American printer: b. London about 1724; d. New York 4 July 1802. Early in life he was a bookseller in London, but in 1760 came to America, and opened a shop in Philadelphia, then in 1761 established himself in New York, and on 22 April 1773 began the publication of a newspaper entitled the 'New York Gazetteer, or the Connecticut, New Jersey, Hudson River, and Quebec Advertiser.' It was Royalist in sympathies and circulated among the Tories and gave to its publisher a position of some prominence. His affairs seem to have been under investigation by both the Provincial and Continental congresses, and he himself placed in temporary confinement. In November 1775, in consequence of his constant assaults upon the patriots, and especially Captain Sears, that officer came from Connecticut with a company of horsemen, proceeded to Rivington's printing office, destroyed the press, and converted the types into bullets. Rivington then went to England, and being appointed king's printer in New York, returned with a new press after the city had fallen into the hands of the British, and in October 1777 resumed the publication of his paper under the old title, soon changed to 'Rivington's New York Loyal Ga-

ette,' and on 13 December to the 'Royal Gazette.' About 1781, when the success of the British was becoming very doubtful, he played the part of a spy, furnishing Washington with important information. When therefore New York was evacuated, Rivington remained in the city and changed the title of his paper to 'Rivington's New York Gazette and Universal Advertiser.' The paper finally suspended publication in 1783, and he passed the remainder of his life in comparative poverty.

**Rix, Julian**, American painter: b. California 1851; d. New York 24 Nov. 1903. He used to say that he was "a pupil of nature," and appears to have had no regular academic training. He came to New York in 1888, and his work immediately attracted attention by its marked personal qualities. His California landscapes have been familiar ever since to all visitors to the exhibitions. His best paintings, among which are scenes in the Maine woods, were produced during the last five years of his life.

**Rix Dollar**, the English way of writing the names of different silver coins used in various European countries, as the *rigsdaler* of Denmark = 53 cents; the Swedish *riksdaler* = 27 cents.

**Rizal, José**, hō-sā' rē-thāl', Filipino patriot and author: b. Calamba, province of La Laguna, Luzon; d. Manila 30 Dec. 1896. He studied medicine at Manila, and was graduated from the University of Madrid as doctor in medicine and philosophy; studied farther in Paris, Heidelberg, Leipzig, and Berlin; made researches in philology and ethnology; and was elected a member of the Berlin Anthropological Society. Having returned to the Philippines, he was soon compelled to emigrate, owing to the hatred visited upon him by the old Spanish party on account of his story, 'Noli Me Tangere,' descriptive of political conditions in the Philippines. He then resided in Japan, North America, and London, where he prepared an edition of Morga's 'Sucesos de las Islas Filipinas,' originally printed in Mexico in 1609. On the continent he wrote another political novel, 'El Filibusterismo.' Subsequently he practised medicine at Hong Kong, and went to North Borneo, where he purposed to establish an agricultural colony of Filipinos. Though he had obtained permission to visit the Philippines, he was arrested on arrival there, and banished to Dapitan. On the outbreak of the native insurrection against Spain, he was accused of being its instigator; and on a third trial was condemned and shot. The proceedings against him have been described as farcical. He was undoubtedly the most talented Filipino of recent times.

**Rizal, ré-thāl'**, Philippines, a province of the island of Luzon, formed by the consolidation of the former province of Manila (excepting the city of Manila) and the district of Morong, bounded on the east by the province of Infanta and the Bay Lagoon, and on the west by the Bay of Manila; area, 1,026 square miles. The surface, except that part of the former province of Manila which lies south of the Pasig River (q.v.), is mountainous, traversed by a number of short irregular ranges. There are many plains which, though fertile, are often inundated by the Bay Lagoon to the destruction of crops. In the western part of the province, the betel is grown extensively, especially in the

vicinity of the town of Pasay; other products of the province are rice, sugar, corn, and tobacco; there are also extensive forests. A fine variety of building stone is quarried on the island of Talim, in the Bay Lagoon. The industries other than agriculture include lumbering, fishing, and the manufacture of lime, mats, and clothing for native wear. The trade of the province naturally concentrates at the city of Manila, and the railroad from Manila to Dagupan, numerous roads, and the waters of the Bay Lagoon and the Pasig River provide means of communication between the different parts of Rizal and Manila. The province was created and civil government instituted in June 1901. Pop. 246,940.

**Rizzi, rē't'sē**, Antonio. See **RICCI, ANTONIO**.

**Roach, rôch**, John, American shipbuilder: b. Mitchelstown, Ireland, 1815; d. New York 10 Jan. 1887. He came to this country in 1829, obtained employment in various iron works and foundries, became a machinist and finally erected a foundry of his own. Later he established the *Etna Iron Works*, where he constructed the first compound engines built in the United States, and also built the largest engines which had been made in the country at that time. In 1871 he purchased the Rainer shipyards at Chester, Pa., enlarged the establishment until its value was estimated at \$2,000,000, and under the name of the Delaware River Iron Shipbuilding and Engine Works, of which he was entire owner, built a large number of merchantmen and also constructed the first ships for the new United States navy, among them the cruisers *Atlanta*, *Boston*, and *Chicago*, and the despatch-boat *Dolphin*.

**Roach**, a small European fresh-water fish (*Leuciscus rutilus*), of the family *Cyprinidae*, related to the dace, chub, etc., and a favorite of anglers, because so much skill is needed in hooking it. It rarely weighs more than a pound, and is grayish or bluish green on the upper parts, lightening into lustrous white on the abdomen.

**Roach**, an insect. See **COCKROACH**.

**Road-runner**, a bird. See **CHAPARRAL-CHICK**.

**Roads**, Improvement of, the rural highways of America are poor, probably the poorest that prevail in any country which has reached so high a state of civilization. Americans have excelled their competitors in other countries in nearly all industrial pursuits and methods, and have produced nearly everything required for the advancement of civilization in greater abundance and greater perfection than is to be found elsewhere in the world. The deficient highway system of the United States is now receiving the earnest attention of the people and they will soon excel in good roads as they have already done in so many other lines of development. In extenuation of the existing condition it must be remembered that the territory is extensive and the mileage necessarily great. Much of the country is still new, and, in the older States, the improper location of many roads has been a hindrance to their permanent improvement because it is evident to the people in many cases that the permanent improvement of these mislocated roads would result in a loss of money, and, therefore, they are inclined to wait for a

re-location. In the western country roads are mostly located on section lines running with the cardinal points of the compass east, west, north, and south, one mile apart; but in the older States roads were not located on section lines nor on scientific principles.

Some people object to the disadvantages in the western country that result from following section lines, because sometimes they run against obstructions. But it is better to have roads located on section lines, as they are in the West, than to have them located at random, as they are in the East, where they are seldom direct in their course. There are many places in the old States of the East where you will not see a road, nor a fence, nor a property line, nor a building nor an object of any kind erected or located by the hand of man that corresponds with any of the cardinal points of the compass. The lack of any uniform principle in the location of the permanent improvements in a country leads to circuitous roads and needless labor in a community. In following section lines in the West some of the roads may be wrongly located, but, owing to the absence of any system in the East, nearly all are wrongly located.

In addition to the ordinary difficulties encountered in so vast a work as permanently improving the highways of a great country, it has been supposed by many of the people that the railway system, which has been developed to such a remarkable extent in this country, would prove to be a sort of substitute for the ordinary highway system. President Roosevelt, speaking to this point in an address which he delivered before the National Good Roads Convention at Saint Louis, Mo., 29 April 1903, said:

Of course, during the last century there has been an altogether phenomenal growth in one kind of road, wholly unknown to the people of old—the iron road. The railway is of course something purely modern. Now, a great many excellent people have proceeded upon the assumption that having good railways was a substitute for having good highways. A more untenable position can not be imagined. (Loud applause.) What the railway does is to develop the country, and of course this development implies the need of more and better roads.

In the United States the composite nature of the government has often led to a doubt as to who should have jurisdiction of the roads and who should bear the cost of their improvement. Some have thought that the United States government should assume the burden, and, in the early part of the 19th century, it built a great national road from Cumberland, Md., to Saint Louis, Mo., and other national roads of less importance. (See *ROADS AND HIGHWAYS*.) Some have thought that the States should assume jurisdiction and bear the burden of cost required for improvement, and this is now being done to a great extent in New England and New York. But the prevailing opinion of the people heretofore has been that the counties or local communities should maintain jurisdiction and bear the burden of cost. So, for generations the people living in the rural districts and owning the agricultural lands have borne the entire burden and have made substantially all the roads of this country. This is a burden, however, that rests too heavily on the rural communities and which they are either unable or unwilling to bear, and, as a result of this fact, all permanent improvement has been retarded. We are now

passing through in this country what England passed through 200 years ago, that is to say, we are trying to require a portion of the community—those living in the rural districts—to build and maintain the roads for the use of all the people. This is an unjust proposition that cannot be maintained successfully in this country any more than in England or other European countries. Macaulay, in his 'History of England,' after describing the almost impassable condition of the rural highways of England during the closing years of the 17th century, says:

One chief cause of the badness of the roads seems to have been the defective state of the law. Every parish was bound to repair the highways which passed through it. The peasantry were forced to give their gratuitous labor six days in the year. If this was not sufficient, hired labor was employed, and the expense was met by a parochial rate. That a route connecting two great towns, which have a large and thriving trade with each other, should be maintained at the cost of the rural population scattered between them is obviously unjust, and this injustice was peculiarly glaring in the case of the great North road, which traversed very poor and thinly inhabited districts, and joined very rich and populous districts. Indeed it was not in the power of the parishes of Huntingdonshire to mend a highway worn by the constant traffic between the West Riding of Yorkshire and London. Soon after the Restoration this grievance attracted the notice of Parliament, and an act, the first of our many turnpike acts, was passed, imposing a small toll on travellers and goods, for the purpose of keeping some parts of this important line of communication in good repair. This innovation, however, excited many murmurs; and the other great avenues to the capital were long left under the old system. A change was at length effected, but not without much difficulty. For unjust and absurd taxation to which men are accustomed is often borne far more willingly than the most reasonable impost which is new. It was not till many toll bars had been violently pulled down, till the troops had in many districts been forced to act against the people, and till much blood had been shed, that a good system was introduced. By slow degrees reason triumphed over prejudice, and our island is now crossed in every direction by nearly thirty thousand miles of turnpike road.

In a government having a composite nature like that of the United States it is not always easy to determine just what part the General Government, the State government, and the local government should respectively take in carrying out highway work, though it is generally admitted that there should be co-operation among them all. Leaders in State politics, governors, and other high officials, are very reluctant to recommend to the people that they levy taxes or issue bonds sufficient to meet the great expense of making the roads what they should be. For the past 100 years the leaders in the various States have been reluctant to recommend that their States assume the burden of cost which is necessary. As a result of this policy the entire burden finally fell on the local communities, that is, the counties, parishes, townships, and districts, so it is true as a general rule and with slight exception that all the rural highways of America have been produced by the farmers of this country, the general theory and practice being that the people in the cities should pave their streets and the people in the country should build and maintain their roads. But this burden has rested so heavily upon the shoulders of the agriculturists that they have not been able to make the progress which is required in order that our highway system may keep pace with our industrial development. It seems to those who have studied the question that the burden is too heavy for the agriculturists to bear, especially in view of the decline in land and agricultural

GRADER AT WORK.

## ROADS

products within the last 25 years. And the case appears stronger when you consider that during the last 25 years there has been a most remarkable concentration of population and wealth in the great cities. In all of the States east of the Mississippi and north of the Ohio a majority of the people are living in cities and much more than half of the wealth is concentrated there. If the policy is pursued of resting the entire burden of improving the highways upon the people of the rural districts, one half, and in some cases more than three fourths, of the wealth of the country wholly escapes this burden.

When practically all the people lived in the country and very few in the city, this system of taxation was a fairly just one; nearly all the people contributed. It was the intention of the founders of the government that this should be the case. But with the concentration of wealth and population the burden has been shifted, and a large proportion of those most abundantly able to bear the cost now escape. In order to re-establish in a measure the original policy whereby all the people should bear all the cost of improving the roads, it is necessary to adopt a different plan.

The State aid plan works well in the States where it has been tried. New Jersey, Massachusetts, Connecticut, and New York have tried it, and now Pennsylvania and Delaware have come to the front with State aid laws. The plan of State aid, briefly stated, is this. The State pays a fixed part of the cost of building roads out of the general fund raised by taxation of all the people and all the property in the State. Under those circumstances corporations, railroads, trusts and the various representatives of concentrated wealth in the cities, all contribute to this fund. When the appropriation of the money is made, however, the fund is expended in the rural districts, but it must be supplemented by money raised by local taxation. In the State of New York, which I believe has the best method of all, the State pays one half, or 50 per cent, the county 35 per cent, and the township 15 per cent.

This leads to a consideration of the wisdom of extending the principle involved in State aid so as to include the United States government. As already stated, the United States began by building certain roads and paying the total cost. Later this policy was reversed and the government did nothing. Under the early policy the government did too much, and under the later policy too little. A policy should be adopted under which the government will supplement the funds raised by State and local taxation. In States which have adopted State aid, the funds raised locally are supplemented by the State funds. So, on the same principle, the funds raised by State and local taxation, should be supplemented by a fund contributed by the General Government.

It is a remarkable fact that no country in the world has ever succeeded in producing a permanent system of well improved highways without the aid of the general government of the country. To the extent that the matter has been left to the local authorities, to that extent the roads have remained unimproved or deteriorated after improvement. It is true that the English government has never taken any portion of the imperial revenues to improve the roads in the United Kingdom; but it is also true that during

the closing years of the 17th century Parliament passed many acts giving exclusive jurisdiction of the roads named to turnpike companies, with authority to collect revenue by taking toll from all the people passing over the road. Subsequent acts finally placed all the principal roads of the kingdom under the jurisdiction of these turnpike companies; and so the burden of building and maintaining the roads was shifted from the shoulders of the local community to the shoulders of the traveling public, which in those days was obliged to pass over the common roads as there were no railways. This practice continued for nearly 200 years and was only recently changed by abandoning the toll gates and placing the repair of the roads again upon the shoulders of the local communities. But this has proven to be unsatisfactory and the roads are deteriorating under the new plan, which is really a return to the old plan that had been abandoned more than 200 years ago. It seems likely that half the cost of maintaining these roads will have to be paid out of the imperial revenues of the general government.

A comparison of the cost of transportation over the common roads of the United States with the cost of transportation over the macadamized or highly improved roads in Europe shows that it costs from two to three times as much to transport the products of the country over the unimproved roads of the United States as it costs to transport similar productions and tonnage over the improved roads of Europe. About 8 cents per ton per mile is the average cost on European roads; whereas in the United States the cost is about 25 cents per ton per mile. This question has been thoroughly investigated by different State governments and by the United States government with the following results: In 1893 the Highway Commission for the State of Ohio reported that the average cost per ton per mile in that State was 25 cents. In 1896 the United States government, through the Office of Road Inquiries in the Department of Agriculture, after an extensive inquiry covering 1,200 counties in nearly all the various States of the Union, reported an average cost of 25 cents per ton per mile; and the Highway Division in the State of Maryland in 1898 reported the cost per ton per mile to be 26 cents in that State.

The macadam road is the cheapest, most durable and most suitable for the permanent improvement of country highways of anything yet devised, developed or discovered. The value of this road consists largely in its cheapness and simplicity. Before the days of John L. Macadam it was thought necessary to lay a substructure of heavy stone under the superstructure of the finished road in order to support it. Macadam contended that the substructure of heavy stone was not only useless but harmful, and that a comparatively thin layer, not to exceed 10 inches, composed of the angular fragments of broken stones reduced to a uniform size, would make a better road than a greater mass underlaid with a heavy substructure. He would allow no stone of greater weight than six ounces to go into the road. He also insisted that these angular fragments without a mixture of any other substance would consolidate under the traffic of the road so as to form a crust, smooth, hard, and impervious to water. The earth itself, he said, must not only bear the weight of traffic passing over

## ROADS AND HIGHWAYS

it, but the weight of the road itself, and the earth, when kept dry, is abundantly able to bear this weight; but if wet the foundation will sink irrespective of the heavy stone that may be laid in it. Isaac B. Potter, writing on this matter for the Good Roads Library, says of the origin and development of the macadam road:

The macadam road was not invented in a day. It is more a development than a creation. The roads of the ancients were often made of huge blocks of stone and some of them were laid to a depth of several feet, so though the stone itself were the main thing on which they relied to support their traffic. By and by it came to be noticed that large blocks of stone when placed at the surface of the road, soon became slippery; that the edges were soon rounded off, that this surface made an insecure footing for the horses' feet and a "bumpy," unpleasant roadway for travelers who rode over it. Then smaller stones, and in some cases gravel, was used as a top layer, but the large stones were still retained in the bottom of the road. When a new road was made huge trenches were dug to the full width of the roadway and sometimes several feet deep. In the bottom of one of these trenches large, rough stone blocks were laid, one layer on another, until the trench was nearly filled. Small stones were used in the upper layers and finally the finishing layer was composed of small broken stone or gravel. Some of these roads were very good, but they were all expensive and unreasonably so. Thousands of tons of stone, millions of wealth and endless labor were wasted in work that was wholly unnecessary and useless. Macadam rejected the method of Tremagnet which included a pavement of large, rough stones set on edge and adopted a method of construction which soon proved its excellence and made him famous. It has since been largely adopted by the engineers of France and other countries and is today the method almost wholly used in making country roads in France, Switzerland, Germany and England.

Nothing has marked the advancement in road building within the last generation as much as the application of labor-saving machinery, now used in road construction. In the days of Macadam the stone was all broken by hand and the process of consolidation was effected by the daily traffic as it passed over the road while in the process of construction. At the present time we have rock crushers for the purpose of reducing the stone to angular fragments; revolving screens for the purpose of separating the stone into different sizes, and from the dust, which is used as a filler and binder over the larger fragments. The power that crushes the rocks also elevates the resulting product into high bins, from which the road surfacing material is loaded into automatic dumping carts by gravity alone, and then these automatic dumping carts or wagons when driven to the road that is under construction are emptied of their contents by gravity and the material spread upon the roadbed at a uniform width and thickness by the forward motion of the automatic dumping carts or wagons as they discharge their loads. These angular fragments are crushed by machinery and separated by the automatic process without the hand of labor being applied in the ordinary manner, and are finally consolidated into a hard, smooth and impervious crust by the passing of a steam roller over the surface many times in succession after the mass has been sufficiently moistened by the application of water, which is generally done by means of an ordinary street sprinkler. So that the finished road may now be produced in a more scientific manner than ever before, but at the same time with greater economy and much less cost, because the application of machinery has been substituted for the primitive hand of common labor.

In addition to the improvements introduced

in the crushing, handling and consolidating of the mass of stone used in the macadam roads, there are many other useful inventions in the way of earth handling machinery by which the cost of grading and shaping the road-bed is much reduced. In addition to the macadam road there are various other kinds in use in the United States, among them being the chert roads common in the South, the brick roads common in the North, and the gravel roads common in both the North and South.

Director Public Road Inquiries, United States  
Department of Agriculture.

**Roads and Highways.** Statesmen, diplomats, historians, and scientists agree that the most important element which lies at the root and beginning of a nation's progress, and that which is indeed the greatest part of the foundation of a country's civilization, is a system of good roads. Without this the national resources and energies remain to a degree unawakened and useless. Roads are the veins and arteries by means of which the circulation of the social body is carried on. Where they are clogged the march of civilization is retarded. The people have little in common. Unity of purpose finds little place with them. Limited opportunity for intercourse of any kind hurts their commercial prospects. The natives of a country entirely without roads would of necessity be simply savages. The absence of good roads would manifestly have retarded progress in the United States had it not been for the fact that the country and the locomotive practically grew up together.

**Roman Roads.**—The ancient Romans were the pioneer constructors of roads, and regarded them as of vital importance for conquest and the maintenance of their empire. They are said to have learned the art from the Carthaginians. Except where some natural barrier made it impossible, the Roman roads were almost invariably in straight lines. The substantial character of these early highways is well demonstrated by the fact that they have in some instances borne the traffic of 2,000 years without material injury. The Appian Way, the "Queen of Roads," reaches its magnificent distance of 350 miles out from the gray walls of imperial Rome, under arches of imperishable fame, past massive ruins, over weird catacombs, and has won a name for all time as the royal Roman road. The Appian Way was begun by Caesar Appian Claudius, the blind, in the year 312 B.C., and reached to Capua, afterward being extended to Brundisium. Over the "Queen of Roads" passed the Apostle Paul, and other saints and martyrs have trod the imperial way over the Campagna, and under the arch of Drusus into Rome.

**British Roads.**—It was the boast of Great Britain 100 years ago that, beyond all rational

State Highway Commissioner.

## ROADS AND HIGHWAYS

dispute, it stood at the head of the world's civilization, because no country on the face of the earth was so well provided with good roads. The length of pike-roads and highways in Great Britain in 1820 reached a total of 214,829 miles. These British roads were often the noblest exemplification of engineering skill, which subjugated and triumphed over great physical difficulties. Many of the British roads were carried over rivers, supported across ravines and hollows by stupendous embankments, driven underground through mountains, and sometimes terminating on piers extending far into the sea. The union of England and Scotland was due not to the kindly compact of 1707, but to the completion of a great highway between London and Edinburgh. This Great North Road, as it has been called, was later extended north from Edinburgh to the remotest extremity of Scotland—a distance greater than from London to Edinburgh. The North Road, which passes through Stamford, Doncaster, York, Durham, and Newcastle, is some 340 miles in length. Arched bridges, as a part of it, were built over the South Esk at Montrose, over the Don at Aberdeen, and over the Dean and the Tyne, the Findhorn, and the Lossie. For 37 miles the road follows the coast line entirely at Aberdeen, and thence strikes across country to Elgin, a distance of 67 miles. Notwithstanding that this section passes over much hilly country, it is so artfully conducted that hardly a single heavy grade is encountered the whole way. The good results of such a road were soon made manifest. The manufacture of coaches and private carriages was materially increased. Inns were established along the highway, the mails were carried more frequently and more quickly, the value of property was greatly increased, trade was promoted, and the general condition of even the poorest inhabitants was ameliorated by numerous accommodations and comforts which were formerly entirely beyond their reach.

The progress of civilization in India is owing largely to the military highway built by the British from Bombay to Calcutta. The English did much also for the interesting island of Jersey by building military roads across the island and around it in the year 1817. In Norway there are many important, well kept roads, and among them the great highway extending from Christiania to Leirdalsoren is conspicuously prominent. This road is 150 miles long and for the greater part of the distance winds through the mountains. The road systems of Austria, Switzerland, and some of the German states are vastly superior to anything in the United States.

*Roads in France.*—To-day France probably leads the world in a system of good roads. Although her area is only about four times as great as that of the State of New York, France has spent about \$600,000,000 in the construction of her common roads, and annually spends about \$18,000,000, or three per cent. of the first cost, in keeping them in repair. France has 87 departments, answering somewhat to our counties, and within these are various forms of local governments bearing some resemblance to those generally adopted in our cities and towns. The government maintains a large body of trained engineers in its special department of roads and

bridges, to which is entrusted the practical work of constructing and repairing the common roads. These comprise: first, national roads, which generally cross several departments, connecting important cities and towns; and second, department roads, which connect the chief cities and towns within the department. The less important roads are still further classified and divided, but the roads within a department are under charge of an engineer-in-chief, whose directions to his corps of subordinate superintendents and overseers must be implicitly followed. No part of the road system of France escapes attention, and every road is subdivided into sections varying in length according to its importance.

*Chinese Roads.*—Even in China, the great uncivilized, the public roads are in many ways admirable from their regularity, good condition, and comfort. Upon the government highways immense bridges have been built from mountain to mountain and over deep ravines. In the Alpine-like region of Xeu-si there is a government road built for the most part over bridges and along the sides of mountains at an enormous outlay of labor. This road is said to have been built under the supervision of a famous general and by his army of many hundred thousand men. In building imperial highways, as in the construction of their canals, the Chinese delight in straight lines, consequently mountains are leveled or tunneled and valleys filled up to meet the road requirements. In some provinces the public highways are flanked by rows of trees on either side, or by a wall eight feet high to prevent travelers from damaging the well-cultivated fields and gardens.

*American Roads.*—In America, the construction of extensive public highways in this country was begun so long ago as 1776, when the first artificial road was built from Philadelphia to New York, and later the famous stage road from New York to Boston. An often proposed grand boulevard from ocean to ocean had its genesis early in the century when Ohio asked for admission to the Union. It was then a debatable question whether emigration would be drawn to Ohio, from the fact that it was cut off from the seaboard at the east—the great Alleghany Mountains forming a barrier which seemed to be impassable. The natural highways then were the waterways, the navigable streams, but it was a very long distance down the Ohio and down the Mississippi, and the journey was attended with such risks and expense that it was deemed almost impracticable. In the Senate of the United States, Henry Clay devised the means. He suggested that when Ohio was admitted into the Union there should be set aside 20 per cent.—afterward reduced to 5—of the proceeds of the sale of public lands in that State, after deducting expenses, for the purpose of building a road to connect with the Ohio River the waters that flowed into the Atlantic Ocean. Among the appropriations that were designed by Congress to help and aid that work two were vetoed, but by the indomitable perseverance of Henry Clay, which won for him the appellation, "The Father of Public Improvements," he carried his plan to a successful termination. The road which was finally built was variously known as the Great Western or National Turnpike Road, the National Highway, and the Cum-

## ROADS AND HIGHWAYS

berland Road, and connected the District of Columbia with the Ohio River. Commenced in 1806 and built at a cost of \$1,800,000, it was the first internal improvement of any magnitude undertaken at public expense. Before the close of the year 1831 over \$300,000 had been expended upon it in repairs. The road ran from between a point nearly opposite Steubenville, Ohio, and Wheeling, in West Virginia, through Ohio and Allegheny counties to Cumberland, thence through Cumberland and Washington counties and in Frederick County to Frederickton, all in Maryland. Connecting there was a road that led to Baltimore and one that led to Washington, D. C. The national road had a uniform width of 80 feet, and was afterward extended westward from the Ohio River to Indianapolis. Other highways followed this pioneer turnpike, and prominent among these was the Old State Road from Albany to Buffalo and thence westward through Cleveland to the prairie lands of the Mississippi Valley.

**The Santa Fé Trail.**—The original highway across the western prairie region was the famous Santa Fé Trail extending from Saint Louis to Santa Fé, N. M., and was first established early in the century. The people of Missouri in 1825, secured a congressional appropriation of \$30,000 for the building of a better wagon road to Santa Fé. I. C. Brown made the survey, but the road was never completed. The first Santa Fé Trail was directly westward from Independence, Mo., to the mountains of Colorado, and thence south to Taos, which is about 175 miles north of Santa Fé. Afterward, as the trade grew, another trail was considerably used, the route which was followed substantially by the Atchison, Topeka and Santa Fé Railroad. But the favorite "old Santa Fé Trail" was that along the Arkansas, thence across to the Cimarron, thence almost in a direct line to Wagon Mound, N. M., a conspicuous landmark, thence to Las Vegas, San Miguel, and Santa Fé. To the northward the pony express blazed the way across the plains to the Pacific coast, followed by the stage-coach and the wagon trains, and later the Union Pacific Railway marked the path of commerce that eventually brought the Atlantic and Pacific in close relation. From those pioneer days to the present the United States have been building roadways—north, south, east, and west—only when increasing internal commerce made it necessary, and the roads thus constructed were made cheaply and with no eye to the future.

**Road Building.**—The fact is patent that the United States government has practically wasted hundreds of thousands of dollars in repairing and maintaining poor roads, which is in itself another argument in favor of great national highways of proper construction. Measured by every rule of economy, the common roads of the United States constitute a poor investment and are the worst in the civilized world. For nearly a century the United States has been expending more in labor and money to carry on a system of inefficient and shiftless roadways than would be sufficient to keep in proper repair double the length of high class roads under the methods pursued by France, Italy, and other countries in Europe. In this almost hopeless struggle for road reform America has but followed in the footsteps and repeated the history of European

nations, where, in the beginning, the same obstacles were encountered and the same objections urged which meet the American to-day. Road building is in itself an art apart—a type of engineering accomplishment—to which few men have given more than brief study, and none, so far as we know, have made the subject a life work. The properly built highway is something more than the work of an engineer, for it is a boon and a blessing to mankind and to civilization. Like a great poem, it will live in after years and bring fame to the man who has built intelligently and for all time. In the laying out of a new road the skill and ingenuity of the engineer are taxed to make the gradients easy, with as little expense as possible in excavating and embanking, without deviating much from the direct course between the fixed points through which the roads must pass. In order to do this, an accurate survey of the tract, including the relative levels of its different parts, and the nature of the strata, is a necessary preliminary. The formation of an extended line of road often involves the construction of extensive bridges, viaducts, and the like, which requires the greatest engineering skill. The best method for road building is a much debated subject among engineers, and there are many systems which are worthy of consideration. The great rival systems of Telford and Macadam are perhaps the most widely known, but the many systems afford a fascinating study for one interested in the welfare of mankind.

**Ocean to Ocean Boulevard.**—Considering the plan for a great national highway from ocean to ocean, a grand boulevard stretching from the Atlantic to the Pacific, the scheme appears so feasible that one marvels it was not accomplished long ago. The air-line distance from New York to San Francisco is 2,600 miles, and the railroad distance 3,370 miles. The railroads, in order to reach commercial, mining, and manufacturing centres, vary greatly from their natural route. A national ocean-to-ocean highway should traverse the distance in about 3,000 miles, starting from Boston and passing through the cities of Buffalo, Cleveland, Toledo, Chicago, Omaha, and Denver to San Francisco. The suburban system of boulevards in each of these cities will average 25 miles from east to west, making a total of 200 miles of a great national roadway already constructed. A hundred smaller towns and cities with well paved roadways, averaging from 2 to 10 miles from east to west, will add 500 miles, making in all scarcely more than 2,000 miles of roadway to be built. Of this 2,000 miles, fully 1,200 miles of roadway already exist in main-traveled highways from east to west, and these inland roads would be widened and improved. This would leave but something like 800 miles of roadway to be bridged, blasted, or filled. In the event of a national highway being built across the continent, it has been suggested that convict labor be employed in the construction of the road, each State adding its quota. Heretofore, there has been great objection to this class of labor in almost every line of work, on account of the feeling that convicts employed in this way deprive free labor of its function. This is universally true except in road building, for on account of the great expense coincident with the employment of free labor, no State has un-

The same section of road as that shown on accompanying plate. This picture was taken April 27th, when in a day, a mile of impassable roadway had been converted into a model street.

**CAROLLTON AVENUE, NEW ORLEANS.**

This street, on the outskirts of the city was chosen for improvement. The picture was taken on the morning of April 26th before the experiment was begun.

## ROAN ANTELOPE — ROANOKE ISLAND

dertaken to build roads to an extent great enough to require a large amount of it. Convicts have been used abroad in building many important local and national works. The great docks at Liverpool, which virtually made that city famous, were constructed entirely by such labor. It is safe to say that these huge structures would never have been built had the work necessitated the employment of free labor with its accompanying cost. Time need be given little consideration in the construction of an ocean-to-ocean boulevard. In this age of rapid construction the element of time is practically annihilated. That far-famed monument of antiquity, the Great Wall of China, was completed within a space of five years, and the length of this great wall is upward of 1,500 miles. The country over which it passes is wild and hilly, and in some places it is built on the steep sides of mountains between 5,000 and 6,000 feet above the level of the sea. The wall crosses rivers and valleys, and in some places large tracts of marsh land were great obstacles to the architects, but all these difficulties were overcome. To accomplish this work the power of a despotic emperor was exerted, and every third man in the kingdom was forced to labor at the undertaking.

WILL M. CLEMENS,

Editorial Staff, 'Encyclopedia Americana.'

**Roan Antelope**, a large and handsome South African antelope (*Hippotragus equinus*), related to the exterminated blaubok and the beautiful sable antelope, which is of a reddish hue, with strong black and white markings on the face. It is becoming very rare.

**Rouen**, rô-an, France, town in the department of the Loire and an important railway junction, 59 miles by rail northwest of Lyons. Extensive engineering work shops are located here, besides iron and copper foundries, many dye-works, pottery and tile works. Pop. about 36,000.

**Roanoke, Va.**, city in Roanoke County; located on the Roanoke River and on the Norfolk & Western railroad, 53 miles west of Lynchburg. Roanoke was formerly a leading tobacco market, but in later years has become the centre of a large section rich in iron mining and farming interests.

**Industries.**—Roanoke has extensive iron manufacturing interests, rolling mills, tobacco factories, bottling works, box factories, locomotive and car shops, canning factories, wheel and spoke factories, machine shops, saw mills, planing mills, wooden-ware factories, knitting and silk works, iron furnaces, bridge works, foundries, rolling mill, cotton mill, carriage and wagon factories, and many smaller industries. It had an assessed real property valuation in 1910 of \$9,539,606; personal property, \$2,510,643; corporations, \$13,688,750.

**Public Buildings.**—The Virginia College for young ladies and the National Business College for both sexes are located here, and the famous Hollins Institute for young ladies is located within seven miles of Roanoke. There is also a very fine high school, and grammar and other schools, court-house, city-hall, Academy of Music, and numerous fine business blocks.

**Government.**—The city is governed by a mayor and city council elected by the people. There is an excellent paid fire department and

electric street railways and electric lights. The city has an improved sewer system and two waterworks plants. There are several national and State banks, excellent hotels, daily and weekly newspapers and monthly periodicals.

**Population.**—Roanoke was incorporated in 1884, and has grown steadily in population and wealth. At that time the population was 5,000; in 1890 it had 16,159 inhabitants, and in 1900 this had increased to 21,495. The population in 1910 was 34,874.

E. B. JACOBS,

Secretary Roanoke Chamber of Commerce.

**Roanoke**, a river in Virginia and North Carolina, formed by the confluence of the Dan and Staunton rivers at Clarksville, Va. It flows south and southeast for nearly 300 miles, entering the Atlantic Ocean through Albemarle Sound. It is a tidal stream fully 80 miles from its mouth and is navigable to its source. The Dan and Staunton are navigable for small vessels for some distance from the Roanoke. At Halifax, N. C., there are rapids and falls which furnish considerable water-power. A canal has been built around this obstruction to navigation.

**Roanoke College**, located at Salem, Va. It was established in 1853 under the auspices of the Evangelical Lutheran Church, and is governed by a self-perpetuating board of trustees. It offers a classical course, leading to the degree of A.B., and a business course, and has also a preparatory department. It is coeducational, but few women have enrolled. The college possesses a numismatic collection of considerable value, a library with 24,000 volumes (in 1910); and grounds and buildings valued at over \$100,000. The productive funds amount to \$136,500, and the annual income in 1910 was \$29,000. The students numbered 210, and the faculty 19.

**Roanoke Colony**, The, in American colonial history, the name applied to a famous land grant of the crown. In 1584 Sir Walter Raleigh, having obtained a large grant of land from Queen Elizabeth, sent out 9 April, seven vessels and 108 settlers under the command of Sir Richard Grenville. After skirting the West Indies and Hispaniola, they landed at Roanoke, in North Carolina, 20 June. Ralph Lane was left in charge of the settlement and Grenville returned to England. During the following winter Lane made numerous exploring expeditions and suffered greatly from Indian attacks. In the spring he received some aid in men and supplies from Sir Francis Drake, but finally the settlers persuaded Drake to take them home. Soon after Grenville arrived with new settlers. These had been destroyed by the Indians when, in 1587, a new colony of Raleigh's, under White, came out. White himself returned to England. When he came back (1590) he found the colony vanished. It seems to have been destroyed by the savages, though there is a theory that descendants of the colonists are still to be found among North Carolina half-breeds.

**Roanoke Island, Battle of.** After the capture by Union troops of Forts Hatteras and Clark, at Hatteras Inlet (q.v.), 29 Aug. 1861, the Confederates began to erect works on Roanoke Island, to command the narrow channel connecting Albemarle and Pamlico sounds, considered as the key to one third of North Caro-

## ROARING—ROBBE-FLY

lina, the possession of which by the Union forces would enable them to reach the railroad connecting Richmond with New Orleans. The Union authorities decided to seize the position, and 7 Jan. 1862 Gen. Burnside, who had a division of 12,000 men, was ordered to seize and hold Roanoke Island, capture Newbern and Fort Macon, open the harbor of Beaufort and, if practicable, to advance from Newbern and seize the railroad to Goldsboro. On 7 January vessels carrying the troops set sail from Annapolis, and by night of the 10th more than 80 vessels of all kinds had rendezvoused at Fort Monroe, 20 being war vessels, carrying over 60 guns, under command of Flag-Officer L. M. Goldsborough. The fleet was divided into two columns under Commanders S. F. Hazard and S. C. Rowan. The expedition sailed from Fort Monroe on the night of the 11th, and after many mishaps, in which some vessels were lost, by 4 February had passed into Pamlico Sound, and orders were given for the advance on Roanoke Island. On the morning of the 5th the start was made, with 65 vessels in all, naval vessels and transports. On the 7th the armed vessels engaged the Confederate batteries on the west side of Roanoke Island, and also small gunboats, which were soon driven off. The forts were silenced and on the morning of the 8th Burnside had over 8,000 troops and a battery ashore at Ashby's Harbor. Confronted by Confederate works, manned by nearly 6,000 men, he had formed his division into three brigades, commanded by Gens. J. G. Foster, Jesse L. Reno, and John G. Parke. The advance was ordered early in the morning, Foster leading, in the centre, Parke on the right and Reno on the left. While Foster pressed the front and engaged with his artillery, Reno, marching at times waist-deep in the mud of the swamps, gained the right of the Confederate position, Parke, in the same manner gaining the left, and, after a more than three hours' fight, a simultaneous charge was made and the entire position carried. This cleared the road. Burnside marched to the head of the island, where the forts on the shore and their entire garrisons were captured. The Union loss was 37 killed, 214 wounded, and 13 missing. The Confederate loss was 23 killed, 58 wounded, 62 missing and about 2,650 captured, including 159 officers. The Confederate gunboats went up Albemarle Sound to Elizabeth City, pursued next morning by Commander Rowan, with 14 vessels. Rowan promptly attacked, and after a short but severe engagement, Lynch, the Confederate commander, ordered the abandonment of his boats, ran them aground and set them on fire. Rowan had 2 killed and 6 wounded. Having gained entire possession of Roanoke Island and the control of the inland waters of North Carolina, Burnside's next step was the capture of Newbern (qv.). Consult: 'Official Records,' Vol. IX.; the Century Company's 'Battles and Leaders of the Civil War,' Vol. I. See NEWBERN, OPERATIONS AT, IN THE CIVIL WAR. E. A. CARMAN.

**Roaring**, a disease of horses whereby the air-passages are partially obstructed, giving rise, when the horse is briskly exercised, to a peculiar noise in breathing. The disease is due to inflammation of the larynx or of the windpipe, with wasting or paralysis of some of the laryn-

geal muscles, whereby the glottis becomes contracted. The fluid discharged from the affected parts, changing into a tough, viscid substance, adheres to the larynx and upper part of the windpipe and further obstructs them. But the specific causes of roaring are various. It sometimes follows strangles. Carriage-horses are more subject to it than saddle-horses, and this is explained by the injury done to the larynx by tight reining. There are also various kinds of roaring, distinguished by the sounds, as whistling, wheezing, high-blowing, and piping. The disorder does not appear to be amenable to treatment, though in early stages, as when it proceeds from catarrh or influenza, it may be relieved by blisters or setons. The disease renders a horse unsound, as it unfits him for the ordinary strain of work.

**Roaring Forties**, a sailor's term for a region of the great Southern Ocean lying south of latitude 40° to 45° S., where strong and often stormy west-northwest winds prevail. Owing to these winds the outward voyage to Australia by sailing vessels is made via the Cape of Good Hope and the homeward voyage via Cape Horn. The same name is sometimes given by analogy to a belt of the North Atlantic about 40° to 50° N.

**Roasting**. See COOKERY.

**Rob Roy** (Robert the Red), Roy, or Gael Ruidh, meaning "red"; Scottish Highland freebooter: b. Buchanan parish 1671; d. Balquhidder 28 Dec. 1734. His true name was Robert Macgregor, but he assumed that of Campbell, on account of the outlawry of the clan Macgregor by the Scottish Parliament in 1693. He was a trader in cattle previous to the rebellion of 1715, in which he joined the adherents of the Pretender. On the suppression of the rebellion the Duke of Montrose, with whom Rob Roy had previously had a quarrel, took the opportunity to deprive him of his estates; and the latter began to indemnify himself by a war of reprisals upon the property of the duke. His was a lengthy and eventful career with many hair-breadth escapes from his enemies. Consult: Sir Walter Scott's 'Introduction' to his novel of 'Rob Roy' (1818) for a full account of this chieftain, interest in whose name was aroused largely by that work; also lives by Macleay (new ed. 1881) and Miller (1883).

**Robber Council**. See EUTYCHES.

**Robber-fly**, one of the slender and long-bodied but strong and active flies of the family *Asilidae*, which prey upon many kinds of insects, by darting upon them, and stabbing them with their dagger-like beaks. These instruments are armed at the tip with bristles which prevent the victim from escaping until his death is accomplished. Some species might easily pierce a man's skin, but do not do so, nor attack cattle. They are an enemy to be dreaded by bee-keepers, however, as they attack bees and where numerous may seriously interfere with their disposition to gather honey or even prevent swarming. Hence a common name is "bee-killer." Some of them resemble wasps, to whom their evil deeds are often attributed. They lay their eggs in earth-mold or rotten wood, and the larvae live in the ground where they prey upon insects and their eggs. Over 3,000 species are known, of which about 400 are American. Consult Howard, 'The Insect Book' (New York, 1901).

## ROBBIE PALM—ROBERT

**Robber Palm**, or **Cocoon Crab**, a large and powerful land-crab (*Birgus latro*) of the East Indies, related to the hermit-crabs, which lives in a hole in the earth under trees, lining its burrow with the fibrous cocoon husks, has an almost lung-like modification of the gill-cavity for breathing air directly, yet visits the sea annually in droves to spawn. It goes abroad only at night and feeds on cocoanuts, though it does not climb for them, and is itself eaten in Amboyna and elsewhere. Darwin has graphically described how it tears the husk from the cocoanuts, and hammers on the round depressions at one end until entrance is effected. Consult Forbes, 'A Naturalist's Wanderings' (1885).

**Robbery**, is the wrongful taking, without a claim of right, of a thing of value from one's person against his will, or by force, or through placing him in fear. In the United States the offense is regulated by the statutes of the various jurisdictions, in some of which the degree of guilt depends on the nature of the act. Actual force need not be employed to induce fear, and fear may extend to a threatened destruction of one's property, or injury to reputation. The law does not hold that the property must be in the actual physical possession of one, or in contact with his person, but merely that it must be in his presence, or in his immediate control; the property need not belong to the person from whom it is taken. Two or more persons may be equally liable for robbery if participating in any of the acts by which it is carried out. Punishment for robbery is fixed by statute.

**Robbia**, rōb'bi-ā, Luca della, Italian sculptor: b. Florence 1400; d. 1482. In the Early Renaissance he appeared as the foremost artist of all his contemporaries, and created a new school of sculpture by his marble friezes for the organ-loft of the Duomo at Florence. These are still to be seen in the Bargello Palace of the same city. The work was completed in 1445 and represents in ten panels angels and boys, singing and playing on various instruments, to the rhythmic movement of the dance. For refined and chastened fancy, skilful grouping and animated expression this masterpiece showed a vast advance on the hieratic sculptures of medievalism. The enthusiasm with which it was greeted was redoubled, when in conjunction with Michelozzo and Maso di Bartolommeo, he executed the bronze doors for the Old Sacristy of the Duomo (1446-64). His name is, however, especially associated with works in clay reduced to pottery in the kiln, and colored and glazed like faience. This faience sculpture was unknown before his time and in it he improved the common process of glazing by a new method all his own. Numberless were the reliefs, medallions, tympanum groups, altars and other decorations which he and his pupils produced in this style. He began by plain white reliefs on a flat blue ground; the flawless beauty of his profiles in many sculptures of this kind have been the inspiration of succeeding artists. But he gradually enriched the coloring by the addition of other tints, some critics think, with a loss to classic purity and simplicity; yet the harmonious composition of his designs, the charm of expression which appears in everything he did, added to the boldness with which he ventured into a new field of plastic art have won

for him a sort of unique glory among the artists of the Renaissance. His works and those of his pupils are met with in every part of Tuscany, and some examples may also be seen in the museums of Europe. Among his most eminent pupils were his nephew, Andrea della Robbia (1437-1528); and the sons of this latter, Giovanni (1469-1529); and Girolamo (1488-1566). Consult: Barbet de Jouy, 'Les Della Robbia' (1855); Cavalucci et Mohnier, 'Les Della Robbia' (1884); Leander Scott, 'Luca Della Robbia' (1883).

**Robbin**, rōb'in, **Albert Farthing**, English writer: b. Launceston, Cornwall, 1 Aug. 1856. He entered journalism in 1871 and has long been London correspondent of the *Birmingham Post*. In addition to several comedies and other dramas he has published 'Practical Politics or the Liberalism of To-day' (1888); 'The Early Public Life of William Ewart Gladstone' (1894); etc.

**Robbins**, rōb'in, **Wilford Lash**, American Protestant Episcopal clergyman: b. Boston, Mass., 7 Aug. 1859. He was graduated from Amherst in 1881, studied at Cambridge Theological Seminary, was ordained deacon in 1884 and held his first charge at Lexington, Mass., where he was advanced to the priesthood in the following year. He was appointed dean of the Cathedral of All Saints at Albany 1887-1903 and in the year last named became dean of the General Theological Seminary. He has published: 'An Essay Toward Faith' (1900); 'A Christian's Apologetic' (1902); etc.

**Robert I.**, king of Scotland. See **BRUCE**, **ROBERT** (3).

**Robert II.**, king of Scotland, son of Walter III., steward of Scotland, and Marjory, daughter of Robert Bruce: b. Scotland 2 March 1316; d. Dundonald Castle, Ayrshire, 13 May 1390. He was recognized as heir to the Scottish throne by Parliament in 1318, but superseded by a son afterward born to King Robert, who succeeded him in 1329 under the title of David II. In 1333, Robert, then steward of Scotland, was a leader at Halidon Hill and in 1334 was appointed joint regent with Marjory. In 1338-41 he was sole regent and after the battle of Neville's Cross in 1346, where King David was taken prisoner, was again made regent. After the death of David in 1371 Robert was declared king and was crowned shortly afterward, the first of the Stuart dynasty. He ratified a treaty with France in the first year of his reign, and continued a nominal truce with England until the succession of the English king, Richard II., with whom he waged two wars. In the latter of these Richard II. and the Duke of Lancaster made successful forays into Scotland. In 1388 these were avenged by an invasion of England by two armies and the famous battle of Otterburn (Chevy Chase) was then fought. The long continued border wars and the disorders caused by the turbulent barons caused the king, whose increasing age disinclined him to the arduous duties of reigning, to entrust the management of the kingdom to his second son, the Duke of Albany, in 1389, and he then retired from public life.

**Robert III.**, king of Scotland, eldest son of Robert II.: b. Scotland, about 1349; d. Rothesay, Bute, 4 April 1406. He was originally known as John Stuart, Earl of Carrick, but assumed

## ROBERT—ROBERT OF MOLESME

the name of Robert on his coronation in 1390. He possessed little strength of mind and incapacitated for military service by his lameness, delegated, therefore, the guidance of military affairs to his brother, the Duke of Albany. The friends of the king's eldest son, the Duke of Rothesay, forced the abdication of Albany in 1398 and war was renewed with England. Scotland was invaded for the last time by an English king in 1400, and in 1402 the Scottish troops met with disastrous defeat at Homildon Hill. Albany then regained the regency, imprisoned Rothesay at Falkland Castle, where he starved him to death, and caused Robert III., in his terror of him to send his second son James to France for safety. James was captured and imprisoned by the English and his father on learning of the event went into melancholy and died soon after. Scott's 'Fair Maid of Perth' is based upon various incidents related above.

**Robert, Duke of Normandy**, surnamed **THE DEVIL**: d. Nicæa, Asia Minor, 22 July 1035. He was the younger son of Duke Richard II. and ascended the throne in 1028 in succession to his brother, Richard III., whom he was said to have poisoned. The earlier years of his reign were passed in the subjugation of his vassals. Then he interfered in various princely quarrels, restoring Baldwin IV. of Flanders to his estates, and aiding Henry I. of France against the plots of the latter's mother. In 1034 he undertook an expedition against England, in support of his nephews, whom Canute had excluded from the succession, but his fleet was wrecked off Jersey, and the attempt failed. He now set out on a pilgrimage to Jerusalem; and while returning died suddenly in Nicæa, poisoned, perhaps, by his servants. His heroic deeds and penance have given rise to numerous stories. 'La Vie du terrible Robert le Diable, lequel fut après l'Homme de Dieu' appeared in 1496, and was much imitated. On it was based the grand opera, 'Robert le Diable,' text by Scribe and Delavigne, music by Meyerbeer. William the Conqueror was his son. Consult: Tardel, 'Die Sage von Richard dem Teufel' (1900).

**Robert, Henry Martyn**, American military engineer: b. Robertsville, S. C., 2 May 1837. He was graduated from West Point in 1857, was assistant professor of philosophy, and later of military engineering there in 1857-8 and served on frontier duty 1858-61. He was on the staff of General McClellan and on duty as an engineer through the Civil War, was promoted captain in 1863 and served as professor of military engineering at West Point in 1865-7. In 1867-95 he was on duty in connection with river and harbor improvements, lighthouses and fortifications. He was made president of the board of engineers for fortifications in 1895, was promoted brigadier-general chief of engineers in 1901 and was retired shortly after. He has published 'Robert's Rules of Order' (1876).

**Robert, Louis Leopold**, French painter: b. Les Eplatures, near Chaux-de-Fonds, Switzerland; d. Venice 20 March 1835. His teachers were the copperplate engraver Girardet in Paris, and the painter David. In 1818 he visited Rome and the study of life among the common people there furnished material for some of his smaller genre pictures. He was especially happy in his representation of robber life in Italy, and his

'Sleeping Brigand' in the National Gallery at Berlin is much admired. But it was at Naples that he found material for his first masterpiece 'The Improvisator' (1823). This was succeeded by 'The Return from the Festival of the Madonna' (1827), now in the Louvre; 'The Arrival of the Reapers in the Pontine Marshes' (1830) in the Louvre; of which latter a replica with variations is in the Berlin National Gallery. In 1832 he visited Venice and completed 'The Departure of the Fishermen of the Adriatic.' An unrequited attachment for the Princess Charlotte Bonaparte preyed upon his mind and he committed suicide in Venice. In his pictures the life of the Italian common people is delicately idealized, and among his contemporaries his works were greeted as they appeared with the greatest enthusiasm.

**Robert of Gloucester**, English historian. He was a monk in the abbey of Gloucester in the latter half of the 13th century, but of his life there nothing is known. His history of England extends from the fabulous Brutus to about 1300 A.D. The work is written in Anglo-Saxon, showing the transition stage of the language previous to Chaucer, and its chief value is linguistic. It is in verse, and contains upward of 10,000 lines and is filled with the most absurd fables. Numerous manuscripts prove its popularity. These are found in the Bodleian, Cottonian, Herald's College, and other libraries. Thomas Hearne printed it at Oxford in 1724, but the best edition is that of Aldis Wright in the Rolls series (two vols 1887). It is partly based on earlier works, is wholly destitute of originality and some have thought it a translation from the French.

**Robert of Molesme**, mô-lâm, Saint, founder of the Cistercians: b. Champagne 1018; d. Molesme 1110. At 15 he became a Benedictine monk in the abbey of Montier-la-Celle, where on account of his high and religious character he was elected prior while still the youngest member of the community. He was afterward appointed abbot of Saint Michael de Tonnerre. He was induced to leave this abbey through the recalcitrancy of the monks. In Colan, however, a desert place near the abbey, there lived certain anchorites, and at their request he became their superior; they thence removed to the forest of Molesme, where they built themselves cells and an oratory dedicated to the Holy Trinity (1075). Here the community became relaxed in discipline through the bounteous contributions provided by the bishop of Troyes and others. Robert therefore left them and eventually settled with some devout members of the abandoned community at a place called Cistercium, or Cîteaux, five leagues from Dijon in the diocese of Chalons. They chose a spot in the uninhabited forest with the consent of Walter, bishop of Chalons, and Renand, viscount of Beaune, lords of the territory. The day of their establishment was Saint Bennet's Day, 21 March 1098, from which must be dated the foundation of the Cistercian Order. The rule established by Saint Robert allotted four hours for sleep, four for singing the offices, four for manual labor and four for study. Thus was the great, practical, and highly useful Cistercian Order founded; and it was presided over by Abbot Robert until his death.

## ROBERT COLLEGE — ROBERTS

**Robert College**, Constantinople, Turkey, so called after Christopher R. Robert of New York, its chief benefactor, was organized by James H. and William B. Dwight, sons of the Rev. Harrison G. O. Dwight, an American missionary to Turkey. It was opened in 1863, its financial support being guaranteed by the philanthropy of Mr. Robert who died in 1878, and whose total contributions to the institution amounted to \$450,000. In 1864 the college was affiliated to the University of New York. Its first president was the Rev. Cyrus Hamlin, D.D., who at his resignation in 1877 was succeeded by the Rev. George Washburn, D.D. The curriculum is similar to that of the average American college; while English is the principal language in use, instruction is also given in 13 other languages. The first home of the college was in a private house; the two college buildings built in 1871 and 1891 respectively occupy a fine site on the Bosphorus.

**Robert Elmore**, a novel by Mrs. Humphry Ward, published in 1889. It is a brilliant example of the embodiment in a work of fiction of intellectual problems of contemporary interest and recounts the struggles of an Anglican clergyman who cannot accept all the miracles and dogmas of Christianity, while in deep sympathy with its spirit. The work had a phenomenal success, partly owing to the nature of its subject, and partly to its genuine literary merit. Aside from its intrinsic value, the sensation it produced entitles it to rank as one of the most remarkable books of its generation.

**Robert-Fleury**, rô-bâr flê-ri, Joseph Nicola, French painter: b. Cologne 8 Aug. 1797; d. Paris 5 May 1890. In early life he studied under Gros at Paris, and after visiting the galleries and studios of Italy finally settled in the French capital. His works are distinguished for impressive characterization and profound sentiment; and among them may be mentioned: 'Night of Saint Bartholomew's' (1833); 'Religious Conference at Poissy in 1561' (1840); 'Jane Shore after her Condemnation Insulted by the People' (1850); 'Sack of a Jew's House at Venice in the Middle Ages' (1855); the last three are in the Luxembourg Museum. He also decorated with paintings the hall of the Chamber of Commerce at Paris.

**Robert-Fleury**, Tony, French painter: b. Paris 1 Sept. 1837. He was a pupil of Delaroche and Cogniet and is known for his historical and genre pictures, as well as for portraits. Among his best works are: 'Warsaw on 6 April 1861'; 'Scene During the Polish Insurrection'; 'The Old Women of the Piazza Ravona, Rome' (1867, in the Luxembourg); 'The Daughters of Danaus' (1873); 'Charlotte Corday at Caen in 1793' (1874); 'The Sack of Corinth' (1879, in the Luxembourg); and a ceiling picture in the Luxembourg 'The Apotheosis of French Sculpture.'

**Robertson, E. H.**, English mining engineer: b. West Riding, Yorkshire, 1877. He was graduated from Christ Church, Oxford, in 1899, studied engineering at Rutherford College, Newcastle-on-Tyne, and in 1892 became demonstrator of mining at the University of Birmingham. He has also assisted in the studies and investigations connected with the Royal Coal Commission.

**Roberts, Benjamin Stone**, American soldier: b. Manchester, Vt., 1811; d. Washington, D. C., 29 Jan. 1875. He was graduated from West Point in 1835, and in 1839 became chief engineer in the construction of the Champlain and Ogdensburg railroad. He was assistant geologist of New York State in 1841, and in 1843 was admitted to the bar and engaged in law practice. At the outbreak of the Mexican War he re-entered the army with rank as lieutenant. He served at Vera Cruz, Cerro Gordo, Contreras, Churubusco, Matamoros and the Galajara pass, was promoted captain, received brevet rank of lieutenant-colonel, and at the close of the war was voted a sword of honor by the Iowa legislature. In 1861 he was commissioned brigadier-general of volunteers and served under General Pope as chief of cavalry in the Army of Virginia. He was present at Cedar Mountain and the second battle of Bull Run and at the close of the war was brevetted brigadier-general in the regular army. In 1866 he became lieutenant-colonel of cavalry and in 1868 accepted the chair of military science at Yale which he occupied until his retirement in 1870. He was the inventor of the Roberts breech-loading rifle.

**Roberts, Benjamin Titus**, American Methodist clergyman: b. Leon, Cattaraugus County, N. Y., 1823; d. Chili, N. Y., 27 Feb. 1893. He was graduated at Wesleyan University in 1848, joined the Genesee Conference of the Methodist Episcopal Church, but in 1860 was one of the seceders from that body who founded the Free Methodist sect, of which he became the first general superintendent. In the same year he began a monthly magazine called 'The Earnest Christian' and in 1865 founded the Cheseborough Academy at North Chili, N. Y., serving as its president from 1869 until his death. He wrote: 'Fishers of Men'; 'Why Another Sect'; 'First Lesson in Money'; 'Ordaining Women.'

**Roberts, Brigham Henry**, American journalist and politician: b. Warrington, Lancashire, England, 13 March 1857. In the summer of 1866 he emigrated with his parents to Davis County, Utah. In 1878 he was graduated from the University of Utah, and soon afterwards was called by the Mormon Church to its missionary service. After laboring for some years as a missionary he was elected to a high office in the church. He also engaged in journalism and was editor-in-chief of the Salt Lake Herald. In 1898 he was a member of the State Constitutional Convention. At the first State election he was the Democratic nominee for Representative to Congress, but was defeated. In 1898, however, he was elected by a large majority. His election created widespread agitation throughout the country, and on 25 Jan. 1900 the House of Representatives by an overwhelming majority voted to exclude him as constitutionally ineligible, as a polygamist, to a seat in that body. He is the author of 'The Gospel' (1888); 'Life of John Taylor' (1892); 'Outlines of Ecclesiastical History' (1893); 'Succession in the Presidency of the Church' (1893); 'A New Witness for God' (1895); 'Missouri Persecutions' (1900); 'The Rise and Fall of Nauvoo' (1900).

**Roberts, Charles George Douglas**, Canadian author: b. Douglas, near Fredericton, New

## ROBERTS

**Brunswick**, 10 Jan. 1860. He was educated at the University of New Brunswick, in 1883-4 was editor of the *Toronto 'Week'*; in 1885-7 was professor of English and French literature in King's College (Windsor, N. S.); and was professor of economics and international law from 1887 until his resignation in 1895, since when he has lived in New York. His reputation was first made as a poet with a gift of melody, a clear and grave manner, and a particular felicity, noticeable in the Canadian school, in pictures of nature. Later, he became equally known for his prose work in 'The Heart of the Ancient Wood' (1900), and 'The Kindred of the Wild' (1902), the latter one of the most successful of imaginative treatments of wilderness life. The collection of short stories, 'Earth's Enigmas' (1896), also is marked by an interesting individual quality. Among Roberts' other volumes are: 'In Drivers Tones' (1887); 'Ave: An Ode for the Shelley Centenary' (1892); 'Songs of the Common Day' (1893); 'The Raid from Beau-sejour' (1894); 'A History of Canada' (1897); 'The Book of the Native' (1897); 'The Forge in the Forest' (1897); 'By the Marshes of Minas' (1900); 'The Book of the Rose' (1903).

**Roberts, David**, English painter: b. Edinburgh 24 Oct. 1796; d. London 25 Nov. 1864. In 1818 from being a house painter he advanced to the profession of scene painter, and in 1821 painted scenery for the stage of Drury Lane, London. All this while he was studying drawing and oil painting, and in 1826 and 1827 he attracted attention by his pictures of Rouen and Amiens cathedrals. Later on he traveled in Spain, Morocco, Egypt, Palestine, Italy, Belgium, making drawings of great buildings and landscapes with picturesque edifices, and working them up into pictures. Among his works the following are the most noteworthy: the drawings from Spain for the 'Landscape Annual' (1835-8); and illustrations for the volume entitled 'The Holy Land, Syria, Idumea, Arabia, Egypt, and Nubia' (1842). His other pictures represent numerous interiors of churches; as St. Miguel at Xeres, Holy Nativity at Bethlehem, St. Jean at Caen, St. Paul at Antwerp, St. Peter's at Rome, the cathedrals of Milan and Seville. Among his religious historic pictures are 'Departure of the Israelites from Egypt' (1829); 'Ruins of the Great Temple at Karnac' (1845); 'Destruction of Jerusalem' (1849), which were followed by 'Rome' (1855); and 'Grand Canal at Venice' (1856). Roberts' style was essentially spectacular; he produced grand, broad effects, with magnificent architectural arrangements, to which the details are of course generally sacrificed.

**Roberts, Ellis Henry**, American financier: b. Utica, N. Y., 30 Sept. 1827. He was graduated from Yale in 1850 and in the following year became editor and proprietor of the *Utica Morning Herald*. He sat in the State legislature in 1867, was a member of Congress 1871-5, afterward continuing his editorial work until 1889, when he was appointed assistant treasurer of the United States. In 1893-7 he was president of the Franklin National Bank in New York, and since 1897 has been United States treasurer. He has published: 'Government Revenues' (1884); 'The Planting and Growth of the Empire State' (1887).

**Roberts, Sir Frederick Sleigh Roberts**, 1st EARL, English military officer, son of General Sir Abraham Roberts: b. Cawnpore, India, 30 Sept. 1830. He was taken to England at two and was educated at Clifton, Eton, the Royal Military College at Sandhurst, and at the East India Company's cadet college at Addiscombe. In December 1851 he was appointed ad lieutenant in the Bengal artillery and in the following April sailed to join his company at Dum-Dum. A few months subsequently he became aide-de-camp to his father, then in command of the Peshawur division, and in November 1854 was posted to a troop of horse artillery on the north-western frontier. His ability secured for him a staff appointment as deputy assistant quartermaster-general and when the Punjab movable column was formed to quell the mutiny, young Roberts was chosen by Neville Chamberlain as his staff-officer, a position he likewise held under Chamberlain's successor, Nicholson. His first experience of actual warfare was at the siege of Delhi, where he was wounded, and in June 1857 he was promoted lieutenant. In September he left Delhi in command of a force bound for Cawnpore, and in the subsequent operations for the relief of Lucknow took an active share. At Khundaganj he rescued at the risk of his life a comrade hard pressed by the enemy, and then captured a standard guarded by two sepoys, for which services he was awarded the Victoria Cross. He participated in the re-establishment of English authority at Fategharh and at Lucknow, and in 1858-60 was on leave of absence to England. He returned to India in the latter year with rank as captain and brevet major, and served again under Sir Neville Chamberlain in the Umbeyla campaign of 1863. In the Abyssinian campaign in 1868 he served as assistant quartermaster-general, held a command in the Lushai expedition of 1871-2 and in 1872-5 was deputy quartermaster-general. He was promoted major-general in 1878 and on the outbreak of the Afghan war was assigned to command the Kuram field force. On 21 November he advanced into Afghanistan though without communication with India and wholly dependent upon a hostile country for supplies. Nine days later he forced the Afghan position at Peiwar Kotul, but further operations were suspended by the treaty of Gandamak. The murder of the British ambassador, Sir Louis Cavagnari, at Kabul, resulted in renewal of the war in 1879, and in October General Roberts again moved against the Afghans. He utterly defeated the forces of Yakub Khan at Kabul, forced his abdication, sent him a prisoner to India, and then occupied with the British forces the fortified cantonment of Sherpur. In 1880 intelligence of the siege of the British garrison at Kandahar by Ayub Khan reached General Roberts and on 9 August he set out to the relief of the garrison with an army of 10,000 picked men. For three weeks the army was lost from the view of the world, but on 31 August Roberts reached Kandahar, gave battle to Ayub Khan, routed his army, and captured his artillery and camp. After the withdrawal of troops was effected he visited England, where he was enthusiastically welcomed and showered with honors. He was created a baronet, presented with the freedom of cities, received the thanks of Parliament and a special

## ROBERTS

medal was struck in honor of his march to Kandahar. In 1881 he was ordered to South Africa as governor of Natal and commander-in-chief against the Transvaal Boers, but peace was concluded before his arrival. He returned to India in November 1881, with rank as lieutenant-general in command of the Madras army, and in 1885 became commander-in-chief of India. In 1890 he received full rank as general and in 1892 was created a baron. He resigned his command in 1893 and returned to England, where he was appointed commander-in-chief of the forces in Ireland in 1895, sworn as a member of the privy council of Ireland, and later in the same year made field-marshal. After the disasters which had continuously beset the British arms in South Africa in 1899 at Stormberg, Magersfontein and Colenso, where Roberts' only son fell, the public turned their attention once more to the field-marshal and clamored for his appointment as commander. He arrived at Cape Town early in 1900 with Lord Kitchener as his chief of staff and at once proceeded to the relief of Kimberley. He captured General Cronje with a large share of his force at Paardeburg, then continued a steady fight until Ladysmith was relieved, and a forced march to Bloemfontein followed by the occupation of that post with British troops. Three months later came the second critical point in General Roberts' manipulation of the war. He made a rapid advance upon Johannesburg and Pretoria by way of Kroonstad and Vereeniging and though handicapped by short rations, opposed at almost every step of the way by the enemy, and with railway communication cut off, Roberts moved steadily upon the Boer capital, seized it, relieved Mafeking, annexed the two republics by proclamation, and in the latter part of 1900 declared the war ended. He then resigned his command and returned home. Parliament voted him its thanks and a gift of £100,000, he was advanced to the peerage as Earl Roberts of Kandahar, Pretoria, and Waterford, and Viscount Saint Pierre, and made commander-in-chief of the United Kingdom. In 1901 he became a member of the privy council. His only son having been killed at Colenso, the peerage will by special grant descend to his daughter. Lord Roberts is to the British army the ideal of a soldier, and by the rank and file is affectionately termed "Bobs." Added to his military skill is an inexhaustible capacity for detail, a quick grasp of possible alternatives, a tireless energy, and the power to command men and to infuse them with his own indomitable courage and determination. He has written: 'The Rise of Napoleon' (1895); and 'Forty-one Years in India' (1897).

HARRIET BRUNNENST.

*Editorial Staff, 'Encyclopedia Americana.'*

**Roberts, Howard**, American sculptor: b. Philadelphia 1843; d. Paris 19 April 1900. He studied at the Pennsylvania Academy of Fine Arts, and in 1866 went to Paris and studied under Dumont and Gumery at the Ecole des Beaux Arts. In 1875 he established a studio in Philadelphia and at the Centennial Exhibition exhibited a statue, 'La Première Pose,' that created a sensation on account of its superior technical qualities. He received one of the three medals awarded to American sculptors.

Other works are 'Eleanor'; 'Hester Prynne'; 'Hypatia'; 'Lot's Wife,' nearly all being at the Pennsylvania Academy.

**Roberts, John Bingham**, American surgeon: b. 29 Feb. 1852. He was graduated at the University of Pennsylvania in 1871, and at the Jefferson Medical College in 1874. He is president of the Philadelphia County Medical Society, Medical Society of the State of Pennsylvania, and vice-president of the American Surgical Society. He is a contributor to medical and scientific papers and has published 'Paracentesis of Pericardium' (1880); 'Surgery of Human Brain' (1885); 'Fractures of Radius' (1897); 'Deformities of the Face' (1900); etc.

**Roberts, Margaret**, British novelist: b. Honyngs, North Wales, 1833. She has lived much on the Continent and wrote her first book in Italian. Her books, which have been published, for the most part, anonymously, include 'Atelier d'Ly's'; 'Mademoiselle Mori' (1860); 'Denise' (1863); 'Madame Fontenoy' (1864); 'On the Edge of the Storm' (1868); 'In the Olden Time' (1883); 'Under a Cloud' (1888); etc.; several of these have been much read in this country.

**Roberts, Morley**, English novelist and journalist: b. London 29 Dec. 1857. After study at Owens College, Manchester, he went, in 1874, to Australia, and there worked on railways in Victoria and as a sheep and cattle rancher in the New South Wales bush. Then he was before the mast in merchant ships, and after some experience in the quartermaster general's department of the British war office and in the India office, set out again traveling, visiting in 1884-6 many of the western United States, Canada, British Columbia, and Manitoba, and later the South Seas. His hardships and adventures have lent a certain element of vigor to his stories, which are better known in England than in the United States, and include: 'King Billy of Ballarat' (1891); 'The Reputation of George Saxon' (1892); 'Red Earth' (1894); 'The Degradation of Geoffrey Alwith' (1895); 'The Great Jester' (1896); 'The Circassian' (1896; with Max Montezole), an interesting book of Eastern life; 'The Keeper of the Waters' (1898); 'The Colossus' (1899), which, as giving a portrait of Cecil Rhodes (q.v.), was perhaps most talked of among Roberts' works; 'Immortal Youth' (1902); 'The Way of a Man' (1902), etc.

**Roberts, Robert Richford**, American Methodist bishop: b. Frederick County, Md., 2 Aug. 1778; d. Lawrence County, Ind., 26 March 1843. He removed with his family in 1785 to Ligonier Valley, Western Pennsylvania, and was brought up on the frontier. He obtained Methodist books, studied for the ministry, in 1802 was licensed to preach, served as an itinerant preacher for several years, and later was in charge of important pastorates in Baltimore and other cities. In 1816 he was elected bishop and soon after removed to Indiana. He did much for Indian missions and among the Indians he was known as "the grandfather of all the missionaries." Consult: Charles Eliot, 'Life of Bishop Roberts' (1853).

**Roberts, William Charles**, American Presbyterian clergyman: b. Aberystwyth, Wales, 23 Sept. 1832. He was graduated from Princeton

## ROBERTS—ROBERTSON

University in 1855 and from Princeton Theological Seminary in 1858. He was pastor of the First Presbyterian Church, Wilmington, Del., 1858-62, the First Presbyterian Church, Columbus, Ohio, 1862-4, and the Second Presbyterian and Westminster churches, Elizabeth, N. J., 1864-82. He was president of Lake Forest, Ill., University, 1886-92, and was moderator of the General Assembly of the Presbyterian Church 1889. He has published 'The Great Preachers of Wales' (1865); translation of 'Shorter Catechism into Welsh' (1867); 'New Testament Conversions' (1895).

**Roberts, William Milnor**, American civil engineer; b. Philadelphia 12 Feb. 1810; d. Brazil, South America, 14 July 1881. As early as 1831 he was senior principal assistant engineer on the Allegheny Portage railroad, and in 1835 he planned and built across the Susquehanna River at Harnsburg the first combined railroad and highway bridge in this country. During the next 20 years he was engineer or contractor on many American railroads and canals. In 1857 he went to Brazil and undertook the construction of the Dom Pedro II. railroad. During 1866-8 he was U. S. civil engineer in charge of improvements of the Ohio River; from 1868-70 associate contractor with James B. Eads in building the bridge across the Missouri at Saint Louis. In 1870 he became chief engineer of the Northern Pacific railroad, and in 1874 visited Europe on an observation tour of jetties as member of the commission of civil and military engineers to report on plans for the improvement of the mouth of the Mississippi River. In 1879 the emperor of Brazil appointed him on a commission of hydraulic engineers to report on harbors and rivers of Brazil, and in prosecution of these labors he died of a fever. He was president of the American Society of Civil Engineers in 1879.

**Roberts-Austen, William Chandler**, English metallurgist; b. 1843, d. 22 Nov. 1902. He was graduated at the Royal School of Mines, London, and became an assistant in the mint. In 1869 he was made assayer to the mint, and in 1882 was appointed queen's assay master. He had already, in 1880, been appointed professor of metallurgy at the Royal School of Mines, and held the two positions at the time of his death. He assumed the name of Austen in 1885. He was one of the founders of the Physical Society of London, of which he became vice-president; a member of the British executive council of the Paris Exposition of 1889; vice-president of the International Mining and Metallurgical Congress at Paris. He contributed papers mainly relating to metals to the 'Philosophical Transactions.'

**Robertson, rōb'ert-sōn, Frederick William**, English clergyman; b. London 3 Feb. 1816; d. Brighton 15 Aug. 1853. He was ordained in 1840; was graduated from Brasenose College, Oxford, in 1841; in that year he was made curate of Christ Church, Cheltenham; and from 1847 until his death was pastor of Trinity Chapel, Brighton. His eloquence was remarkable, and soon extended his renown far beyond local limits. He was an eclectic in theology, and declared for no party in a time when the clergy were generally partisans. His frequent dissent from various positions of the schools of thought, brought upon him numerous attacks, whose importance he was wont to overestimate. His views were colored by study of the Germans, and developed

considerably during the progress of his ministry. His mind was positive, original, and without fear, and his constant labor greatly affected his health. He was deeply interested in the workingmen's institute, which he founded at Brighton, and whose work he made very effective. His 'Sermons' (1855-90), though derived from inadequate shorthand notes or from recollections prepared by himself, have been very widely read. His other important work has been collected in his 'Literary Remains.' Consult the 'Life and Letters' by S. A. Brooks (1865).

**Robertson, Harrison**, American journalist and author. He is associate editor of the Louisville *Courier-Journal*, Kentucky, and has written: 'How the Derby Was Won' (1889); 'If I Were a Man' (1899); 'Red Blood and Blue' (1900); 'The Opponents' (1902), etc.

**Robertson, James**, English royal governor of New York; b. Fifeshire, Scotland, about 1720; d. London, England, 4 March 1788. He entered the army and after various services sailed for America in 1756, was appointed major-general of the royal troops raised in America and barrack-master at New York. He commanded a brigade at the battle of Long Island in 1776 and after André's capture made an earnest effort to secure his release. In 1779 he was appointed royal governor of New York, and in 1782 received rank as lieutenant-general. He returned to England in the following year. His reputation was that of an avaricious and supercilious officer and in his position as governor he was charged with arbitrary measures.

**Robertson, James**, American pioneer; b. Brunswick County, Va., 28 June 1742; d. Chickasaw region, Tenn., 1 Sept. 1814. In 1769 he accompanied Daniel Boone (q.v.) on the latter's third exploration, and stopping at Watauga (now Elizabethton, Tenn.), planted corn. In 1770 he returned thither with a band of North Carolinian settlers. The settlement soon numbered some 200. Both North Carolina and Virginia asserted jurisdiction over it, but neither colony offered protection; and it was left an independent outpost of civilization. With John Sevier, Robertson became the head of the communities which gathered about the Holston and Watauga. In 1777 he was commissioned agent of North Carolina among the Cherokees, and during his residence of more than a year thwarted the British agent and kept at peace the great body of Cherokees and Creeks. With a party of settlers he set out in 1779 for the French Lick of the Cumberland, and on 25 December made the beginnings of a town on the site of Nashville, then 15 days' journey from the westernmost white confines. A fort built, a military organization was made, with Robertson as colonel. Troubles increased. Provisions were low, and the Indians hostile. He detached the Chickasaws and Choctaws from their English alliance and concluded a treaty with the Cherokees. He also defended the settlement against the Creeks, who were abetted by the Spanish authorities of Louisiana; and refused to organize a separate state in alliance with Spain. In 1790 Robertson was commissioned United States brigadier-general, and latterly he was government Indian agent. He was well fitted for his frontier career, and especially successful in his dealings with the savages. His favorite saying, 'Man proposes, but God dis-

posed," he always insisted was somewhere in the book of Job. Consult the 'Life' by Putnam (1899); Gilmore, 'The Rear Guard of the Revolution' (1886); and 'Harper's Magazine,' February 1888, pp. 420-6.

**Robertson, James Burton**, English historian: b. London 15 Nov. 1800; d. Dublin 14 Feb. 1877. He was educated at the Roman Catholic College of St. Edmund, near Ware, and was called to the bar in 1825. Later he studied literature, philosophy, and dogmatic theology in France. His first important publication was a translation of Frederick Schlegel's 'Philosophy of History' (1835). He lived in Germany in 1851-4, and here produced a translation of Mohler's 'Symbolism or Exposition of Doctrinal Differences Between Catholics and Protestants' (1843), a work which made a deep impression on the Tractarians. In 1855 J. H. Newman, then rector of the Catholic University at Dublin, called him to the chair of geography and modern history and later the department of English literature was assigned him. His original works comprise lectures 'On Subjects of Ancient and Modern History' (1859); 'On Subjects of Modern History and Biography' (1864); on the 'Writings of Chateaubriand, and on the Illuminati, Jacobins, and Socialists'; 'On the Life, Writings and Times of Edmund Burke' (1869), together with poetry and translations.

**Robertson, James Craigie**, Scottish clergyman: b. Aberdeen, Scotland, 1813; d. Canterbury, England, 9 July 1882. He was graduated from Cambridge in 1834, and took orders in the Anglican Church, in 1836. He was made canon of Canterbury in 1859, and from 1867-74 was professor of ecclesiastical history at King's College, London. He published: 'How Shall We Conform to the Liturgy' (1843); 'Church History' (1852-73); 'Plain Lectures on the Growth of Papal Power' (1876); edited Heylyn's 'History of the Reformation' (1849); 'Materials for the History of Archbishop Thomas Becket' (1875-82); etc.

**Robertson, James Logie**, Scottish educator and author: b. Milnathort, Kinross-shire, 18 Sept. 1846. He was educated at Edinburgh University, and has been first English master at Edinburgh Ladies' College from 1891. He has published several volumes of pleasing verse, 'Horace in Homespun' (1886); 'Ochil Idylls' (1896); 'Adaptations from Dunbar' (1895); etc., while among his prose works may be cited 'In Scottish Fields' (1890); 'A History of English Literature' (1894). He has also edited editions of Scott (1894) and Burns (1896); 'The Select Chaucer' (1902); etc.

**Robertson, Morgan**, American author: b. Oswego, N. Y., 30 Sept. 1861. He was educated in the public schools and at Cooper Institute; went to sea in 1877-86 and then engaged in business as a jeweler. He has published, 'A Tale of a Halo' (1894); 'Spun Yarn' (1898); 'Where Angels Fear to Tread' (1899); 'Shipmates' (1901); 'Down to Sea' (1903); 'Down to the Sea' (1905).

**Robertson, Thomas William**, English actor and dramatist: b. Newark on Trent, 9 Jan. 1829; d. London 3 Feb. 1871. He came of a theatrical family and played his first part at the age of four. He had a varied career as actor, newspaper writer, adapter of plays, as well as dramatist, in none more than successful enough

to gain a bare subsistence until he wrote 'David Garrick,' produced by E. A. Sothorn in 1864. This piece has taken a permanent place on the English stage. Following this a play called 'Society' had a long and successful run, making the fortunes of the Prince of Wales Theatre and the author. At the same house were produced his most successful series of plays, including 'Ours,' 'Caste,' 'Play,' 'School,' and 'M. P.' Some of these, especially 'Caste,' his masterpiece, are revived from time to time. His comedy was artificial, with a strong sentimental interest; but he was a good observer of manners and drew his characters from the life. He established a distinct school, and has had several followers, though in the best exponents of the later English dramas he has been replaced by writers whose methods are less artificial and hence more logical. His 'Principal Dramatic Works' were published with a memoir by his son in 1889. Consult also Pemberton, 'Life and Writings of T. W. Robertson' (1893); Cook, 'Nights at the Play' (1883); Clement Scott, 'The Drama of Yesterday and To-day' (1899).

**Robertson, William**, Scottish historian: b. Borthwick, Midlothian, 19 Sept. 1721; d. near Edinburgh 11 June 1793. After the completion of his course in Edinburgh University, Robertson obtained a license to preach in 1741, and in 1743 was presented to the living of Gladsmuir, in East Lothian. His 'History of Scotland During the Reigns of Queen Mary and King James VI.' appeared in 1759, and was received with general applause, though modern research has deprived it of most of its historical value. This work, which reached a 14th edition before the author's death, led to his nomination to the chaplaincy of Stirling Castle in 1759, as one of the king's chaplains in 1761, and as principal of the University of Edinburgh in 1766. The year after he was made historiographer-royal of Scotland, with a salary of £200 per annum. His 'History of the Reign of Charles V.' appeared in 1769, and his 'History of America' in 1777. His latest work appeared in 1791, under the title of a 'Historical Disquisition Concerning the Knowledge which the Ancients Had of India, and the Progress of Trade with that Country Prior to the Discovery of the Cape of Good Hope.' Consult: 'An Account of the Life and Writings of William Robertson' (1801-2); Gleig, 'Life and Writings of William Robertson' (1812); Graham, 'Scottish Men of Letters in the 18th Century' (1901).

**Robeson, rōb'son, George Maxwell**, American politician: b. Oxford, Warren County, N. J., 1829; d. Trenton, N. J., 27 Sept. 1897. He was graduated at Princeton University in 1847, and three years later was admitted to the bar. In 1867 he was appointed attorney-general of New Jersey, and during the two administrations of President Grant (1869-77) was secretary of the navy. He was a successful candidate for Congress in 1876 and 1880, and on retiring from Congress in 1883 resumed his law practice in Trenton, N. J.

**Robeson, Henry Bellow**, American naval officer: b. New Haven, Conn., 5 Aug. 1842. He was graduated from the United States Naval Academy in 1860, entered the navy as midshipman, and in 1864 was promoted lieutenant. He was engaged in the attack on Charleston, S. C., 7 April 1863, and lost an arm in the same year. He

## ROBESPIERRE

party from the New Ironsides in the capture of the Confederate works at Morris Island. He participated in both attacks on Fort Fisher, was advanced to be lieutenant-commander in 1866 and commander in 1874. He was made commodore in 1898 and in 1899 was retired with rank as rear-admiral.

**Robespierre, rô-bês-pê-ër or rô-bês-pêr, Maximilien Isidore François Marie, French revolutionist.** b. Arras 6 May 1758; d. Paris 28 July 1794. He was the son of an avocat and having been left an orphan at 11 was sent by his grandfather to the college of his native town, from which he passed in 1770 to the Collège Louis-le-Grand at Paris on a scholarship given him by the Bishop of Artois. After pursuing the study of law with great distinction, he returned, in 1781, to Arras, where he adopted the profession of avocat. Solid, rather than brilliant, he quickly became known as a skilful lawyer and a man of unimpeachable integrity. With growing success he gave much of his time to the dilettante pursuit of literature, wrote essays in competition for prizes offered by the provincial academies and was a prominent member of the Rosati, a society devoted to the cultivation of wit and letters. He was an ardent student of Rousseau and a fanatical believer in the teachings of the Genevan philosopher; indeed Robespierre's unwavering convictions in the possibility of realizing Rousseau's ideal society explains his course in the days when he stood forth as the greatest figure in France, and gives the secret of his temporary success. In the events leading up to the election of the States-General Robespierre appeared prominently as the champion of the liberal views then so widespread among the French bourgeoisie. He was elected fifth deputy to the States-General from Artois, and allied himself with the radical faction in that body. In the constituent assembly he spoke frequently and always in the spirit of that equality which he believed was now at length to be established in France. Of small stature and by no means robust health, weak-voiced and pale-eyed, he did not impress himself on the mass of the assembly, but those who came into personal contact with him were gained over by his tremendous sincerity, and Mirabeau said of him: "That young man believes what he says; he will go far." Robespierre's great strength, however, was in the club of the Jacobins, where his polished, classical declamations gained him the ardent support of those members who had been recruited from among the working classes and the small bourgeoisie of Paris. His power in the club became absolute when the more conservative members seceded in 1791, after the more radical faction, under the inspiration of Robespierre, had prepared the petition for the deposition of Louis XVI, which led to the massacres in the Champ de Mars on 17 July. His popularity was demonstrated on the day of the dissolution of the National Assembly, 30 Sept. 1791, when Robespierre and Pétion were drawn in triumph through the streets of Paris, and crowned as "incorruptible patriots" by the people. In accordance with his own motion, adopted in May 1791, prohibiting members of the constituent assembly from sitting in the succeeding legislature, Robespierre took no direct part in the sessions of that body, but he continued to wield great

influence over its deliberations through his power in the Jacobine. In February 1792, he became public prosecutor at Paris, but resigned the office in April on account of the virulent attacks of the Girondists, who regarded him with special hatred because of his opposition to their favorite policy of war against Austria. Robespierre's opposition to the war was based on humanitarian grounds; he was, besides, a man of theories and not of action, and this would explain the little share he took in the uprisings of 20 June and 10 August, which, under the guidance of Danton, effected what Robespierre was quite pleased to see consummated, the overthrow of the Bourbon monarchy. Shortly after the storming of the Tuileries, Robespierre became a member of the Paris Commune; his personal popularity lent strength to that body, but his inability to prevent the prison massacres of September showed that his power was by no means absolute in the ranks of the radical party.

In the Convention to which he was elected as the first deputy from Paris, Robespierre became the leader of the Mountain. The Girondists turned the full force of their eloquence against him, and accused him of aiming at the dictatorship. In the crisis which attended the trial of Louis XVI, Robespierre for once assumed a firm and definite line of action. He pleaded for the death of the king and by so doing gained over to his side the party of Danton, Carnot and Bellaud-Varenne, who were disgusted by the temporizing policy of the Girondists at a time when France was in imminent danger of foreign invasion and needed a strong government to make headway against her enemies. The condemnation of Louis XVI was a triumph for Robespierre, who, however, did not cease from his attacks on the Girondists. The struggle became one of life and death. In April, Robespierre denounced them in the body of the Convention, and on the fateful days of 31 May and 2 June the destruction of the party was accomplished with the aid of the Parisian mob. (See GIRONDIST.)

In July 1793, Robespierre was made a member of the Committee of Public Safety, which for a year was to be the virtual ruler of France. To curb dissension at home, so as to present a united front to the foreign foes of the country, the committee organized the Terror with which the name of Robespierre has become, through legend, synonymous. To the world at large Robespierre appeared as the master of the committee and the ruler of France. As a matter of fact, his power was in no way absolute. Of the 12 members of the committee, the majority were quite opposed to his Rousseauian ideals and only two of the 12, Couthon and St. Just, were professed followers of Robespierre. The rest of the committee were practical men of affairs, like Carnot, Bellaud-Varenne, or Collot d'Herbois, upon whose shoulders fell the real task of government. Robespierre's services to the committee were such as his immense popularity and spotless reputation could render it. He was the apologist for the committee in the Convention and before the people, but he differed from his associates entirely so far as the motives of his action are concerned. While the Terror to them was but a thorough, though possibly radical, means for establishing peace within the country, Robespierre saw in the Terror an effective

instrument for bringing about the erection of Rousseau's ideal state, by wiping out all opposed to his favorite theories. He first turned against Hébert (q.v.) and his followers in the Paris Commune, who had aroused his enmity by their uncompromising democracy, in their display of which they were guilty of the most ridiculous excesses, and their professed atheism, which attained its climax in the establishment of the worship of Reason by Chaumette (q.v.) The Hébertists were brought to the scaffold on 24 March 1794, and they were followed by Danton, Camille Desmoulins and their followers on 5 April. On 13 April came the turn of Chaumette. Danton fell because he had begun to advocate a moderation of the Terror and thereby had incurred the enmity both of the men of action on the Committee of Safety and of Robespierre, to whom alike the continuance of the Terror seemed essential. To hasten the work Robespierre caused the infamous law of the 22 Prairial (10 June) to be proposed by Couthon, whereby the revolutionary tribunal was freed from all restrictions of legal procedure, and thus improved sent nearly 1,300 persons to the scaffold between 12 June and 28 July.

On 8 June Robespierre attained the zenith of his career, when, as president of the Convention, he celebrated with great pomp the Feast of the Supreme Being, whose existence had been formally admitted by the Convention in the preceding month. His fall followed speedily. The men on the Committee of Safety who had suffered his official leadership as long as he was content to remain largely a figure-head, turned upon him when he began seriously to assert mastery over the committee. Besides, it became apparent that the excesses of the Terror could not go on, and that reparation would be demanded, and Robespierre was chosen as the scapegoat of the committee. The attack on Robespierre began 17 June, when Vadier, a member of the committee of general security, satirized him before the Convention. Instead of joining battle, as he was urged to do, Robespierre went into retirement for more than a month to prepare his defense. On 26 July he appeared in the Convention and declared that the Terror should cease, and that the committees of public safety and general security should be reorganized. Ominous threats appeared in his oration, which for a time held the Convention terror-stricken, and caused it to vote his proposition. Quickly, however, he was assailed by various orators, the Convention reconsidered its action, and in the session of the following day, the 27 July, the fateful 9th Thermidor, the secret intrigues of his associates on the committee, the fear of his intended victims and the resentment of the Dantonists, who had not forgotten the death of their leader, fell upon Robespierre. His arrest was ordered and with him that of St. Just, Couthon, Lebas, and his younger brother, Augustin Robespierre. Rescued by the national guards under Henriot, and brought to the Hôtel de Ville, the great Terrorist showed no capacity for action. The Convention placed him outside of the law, and despatched a portion of the national guard under Barras against him. In the assault Robespierre was shot in the jaw by a gendarme and taken in a pitiful condition to prison. On the following day he was brought before the revolutionary tribunal and with Couthon and St. Just and

others of his followers was sent to the guillotine. Consult: Aulard, 'La Société des Jacobins' (1891); Hamel, 'Vie de Robespierre' (1865-7), the principal authority; Belloc, 'Robespierre' (1902); Morse-Stephens, 'Principal Speeches of the Orators and Statesmen of the French Revolution' (1892).

**Robin**, a name originally applied in England to the red-breast (q.v.), a bird so familiar and so dear to the English heart that loyal colonists in many parts of the world have felt impelled to transfer the name to native species, which often resemble the original in little but the ruddy breast. The American robin is a true thrush (*Merula migratoria*) of the family *Turdidae*, and is found in summer throughout North America from Alaska to Virginia. Robins retire from higher latitudes only as their food begins to fail, or when driven south by inundating snows. During the winter months they are numerous in the Southern States, but even as far north as Boston robins are sometimes seen assembling round the open springs wherever berries may be found in the depth of winter. In the New England and the Middle States the robin is perhaps the most abundant breeding bird. Their nests of mud and grass are often seen on the horizontal branch of an apple tree, or in a shade tree, especially evergreens. The eggs, about four, are of a pale bluish-green, and without spots. They raise several broods in a season.

Robins feed upon insects, ripe cherries and other small fruits, but are especially fond of earth-worms, which they extract from their burrows in the early morning and late afternoon with the greatest skill and industry, and of which they devour vast quantities. In spite of the fact that fruit growers consider them harmful, the cheery whistle and vivacious manners of the robin are rapidly gaining for it a place in popular esteem analogous to its English namesake. Unfortunately there are still parts of the country, and particularly of the South, where a sordid interest leads to the slaughter of great numbers of robins for the pot. In North Carolina they are killed at night in their roosting places. On the Pacific coast the robin varies to the sub-species *propinqua*, and in lower California a distinct species (*M. californica*) occurs. *Hesperocichla naevia* is sometimes called the Oregon robin.

**Robin Adair**, a-dâr, or **Eileen Aroon**, a familiar air, which, with the original words, was written, tradition says, by one Carroll O'Daly, an Irishman, of Elizabeth's time. However that may be, it was first popularized in England in the latter 18th century by Tenducci, an original singer in Dr. Arne's 'Artaxerxes.' Tenducci probably learned it in Ireland; at least it is known that he sang 'Eileen Aroon' with Irish words which had been phonetically arranged for him. The 'Robin Adair' form obtained currency through its rendering by Brahms at his benefit in London in 1811. Brahms's version was introduced by Boieldieu into the latter's opera of 'La Dame Blanche.' Beethoven made a trio arrangement of it, with accompaniment by pianoforte, violin and cello.

**Robin Goodfellow**. See PUCK.

**Robin Hood**. See HOOD, ROBIN.

**Robin Snipe**, the red-breasted sandpiper or knot (*Tringa canutus*) in its summer plumage. This is among the largest of the sand-

pipers, and is distinguishable by the long, perfectly straight beak combined with the absence of webbing from between the toes, the middle one of which is much shorter than the tarsus. It is upward of 10 inches long and stoutly built, with rather short stout legs. In breeding plumage the entire under parts are reddish brown, and the autumn young, which are abundant during the gunning season, have the breast and belly whitish tinged with red, and the back very characteristically marked with white and black semicircles. Such seasonal changes in coloration are unusual among the *Scolopacidae*. The knot is nearly cosmopolitan, breeding in high northern latitudes and wintering in the southern hemisphere. It passes through the United States in April and May, and again more leisurely in August to October, frequenting the seashore in small flocks, and, less commonly, the large rivers and lakes of the interior. Its habits are similar to those of the other sandpipers (q.v.), with which it associates. Because of its large size it is a favorite with gunners, among whom it is known in the autumn plumage as the gray-back.

**Robins, rób'inz, Benjamin**, English mathematician: b. Bath 1707; d. Port Saint David, Coromandel coast, India, 29 July 1751. He early became known as a mathematician of unusual ability, and in 1728 published a confutation of the veteran Johann Bernoulli (q.v.), who had attempted a defense of Leibnitz's theory as to the laws of motion relative to bodies impinging on one another. After some time spent as a private instructor in mathematics and physical science, he turned engineer, and made particular study of fortifications and gunnery. He published in 1742 his 'New Principles of Gunnery,' which he had undertaken by way of furthering his unsuccessful candidacy for the professorship of fortification at Woolwich. It was translated into German and French, and has been regarded as the starting point of the modern scientific study of the matter. Much of it was derived from personal experiment with gunpowder. In 1749 he was made engineer-general to repair the forts of the East India Company. He wrote several political pamphlets, which brought him into some notice. In 1761 'Mathematical Tracts,' containing the 'Principles of Gunnery,' appeared under the editorship of James Wilson. There were subsequent editions. Consult the memoir by Wilson in this collection.

**Robins, Edward**, American author: b. Pau, France, 2 March 1862. He was educated at a military academy in Philadelphia, and in 1883 engaged in newspaper work. He was on the editorial staff of the Philadelphia *Public Ledger* in 1884-8, 1895-7, and has since devoted himself to authorship. He has published, besides several juvenile works, 'Echoes of the Play House' (1895); 'Twelve Great Actors' (1900); 'Romances of Early America' (1902); etc.

**Robins, Elizabeth**. See PARKER, ELIZABETH ROBINS.

**Robinson, rób'in-són, Agnes Mary Frances**. See DARMESTETER, AGNES MARY FRANCES ROBINSON.

**Robinson, Albert Gardner**, American journalist: b. Winchester, Mass., 21 Feb. 1853. He was engaged in commercial pursuits in 1871-68, but in 1868 became special war correspondent for the New York *Evening Post* in Cuba and Porto

Rico. He subsequently went to the Philippines and South Africa in the same capacity. He has published 'The Porto Rico of To-day' (1899); 'The Philippines—the War and the People' (1901); 'Historical Review of the Period of Intervention in Cuba'; etc.

**Robinson, Beverley**, American Loyalist soldier: b. Virginia 1723; d. Thornbury, England, 1792. He was a major under Wolfe at the taking of Quebec in 1759, and at the commencement of the Revolution was a large landed proprietor on the Hudson. He was opposed to the measures of the British ministry respecting the colonies, and abandoned the use of imported merchandise. Nevertheless, he remained loyal, and reluctantly entered the military service of the crown. The Loyal American regiment was recruited largely by him, and he was made its colonel. He was connected with the negotiations preliminary to Benedict Arnold's treason; and at the time Arnold was occupying as headquarters Robinson's country-seat. At the conclusion of the war he went to New Brunswick, where his name appears as a member of the first council, though he never took his seat; and thence to England. He lost his property by confiscation, and by way of compensation received £17,000 from the English government. Consult: Ryerson, 'The Loyalists of America and Their Times' (1880).

**Robinson, Charles Mulford**, American author: b. Ramapo, N. Y., 30 April 1869. He was graduated from the University of Rochester in 1891, was editor of the Rochester *Post-Express* in 1891-1902, and has published: 'The Improvement of Towns and Cities' (1901); 'Modern Civic Art' (1903); etc.

**Robinson, Charles Seymour**, American Presbyterian clergyman and hymnologist: b. Bennington, Vt., 31 March 1829; d. New York 1 Feb. 1899. He was graduated from Williams College in 1849, studied at Union Theological Seminary and at Princeton, and was ordained in the ministry in 1855. He held a pastorate in Troy 1855-60, and thereafter was pastor of various churches in New York with the exception of 1868-70, when he had charge of the American Chapel, Paris, France. He published several volumes of sermons and other works, and is widely known as a collector of hymns. His publications include: 'Songs of the Church' (1862); 'Church Work' (1873); 'The Parables of the Bondage and the Exodus' (1887); 'New Laudes Domini' (1892); 'Annotations on Popular Hymns' (1893); 'Simon Peter: Later Life and Labors' (1894); etc.

**Robinson, Edith**, American novelist. b. Massachusetts 1858. Her literary work is partly of a juvenile character and includes: 'Forced Acquaintances' (1887); 'A Little Puritan Rebel' (1898); 'A Little Puritan Pioneer' (1901); 'A Puritan Knight Errant' (1902); etc.

**Robinson, Edward**, American Biblical scholar: b. Southington, Conn., 10 April 1794; d. New York 27 Jan. 1863. Graduated from Hamilton College in 1816, he went in 1821 to Andover to publish his edition of books, i.-ix., xviii., and xix. of the 'Iliad,' there aided Moses Stuart (q.v.) in the preparation of the second edition (1823) of the latter's 'Hebrew Grammar,' and rendered into English (1825) Wahl's 'Clavis

**Philologica Novi Testamenti.** After European study, largely in Halle and Berlin (1826-30), he was professor extraordinary of sacred literature in the Andover Theological Seminary in 1830-3, and professor of Biblical literature in Union Theological Seminary from 1837 until his death. In 1838 and 1852 he visited Palestine with the scholarly missionary, Eli Smith (q.v.), and there made careful surveys and investigations. His chief work, *'Biblical Researches'* (1841; 3 vols. compressed into 2, with a 3d 1856), which obtained for him the Royal Geographical Society's gold medal, was based on these studies. He was a leading member of the American ethnological, geographical and Oriental societies, and edited in 1831-4 the *'Biblical Repository'*, in 1843 the *'Bibliotheca Sacra'*, with which the *'Repository'* was incorporated, and for which he continued to write until 1855. Among his other publications are: *'A Dictionary of the Bible'* (1833); editions of Buttmann's *'Greek Grammar'* (1833; 3d ed. 1851) and Genseus's *'Hebrew Lexicon'* (1836; 5th ed. 1854); and Greek (1845, 2d ed. 1851) and English (1846) harmonies of the Gospels. Consult: Hitchcock, *'Life, Writings and Character of Edward Robinson'* (1863).

**Robinson, Edward Arlington**, American poet. b. Head Tide, Maine, 22 Dec. 1869. He was educated at Harvard and has published *'The Torrent and the Night Before'* (1896); *'The Children of the Night'* (1897); *'Captain Craig'* (1902), collections of verse which display much promise.

**Robinson, Sir Frederick Philipps**, English soldier: b. near New York Sept. 1768; d. Brighton, England, 1 Jan. 1852. He became ensign in 1777 in a Royalist American regiment, raised by his father, and fought in the battles of Horsa-neck, Stony Point and New London. He returned to England in 1784; entered the West India service in 1793 and was present at the capture of Martinique, St. Lucia and Guadeloupe. He became colonel in 1810, and commanded a brigade in the Peninsula campaign of 1813, where he fought gallantly; was promoted major-general in 1814 and rewarded with a medal. He took part in the engagement before Plattsburg in 1814 during the war with the United States, and in 1816 left Canada for the West Indies, where he was put in command of the troops in the Windward and Leeward Islands and for a time was governor of Tobago. At the time of his death he was the soldier of longest service in the British army.

**Robinson, Frederick William**, English novelist: b. London 23 Dec. 1830; d. there 6 Dec. 1901. He was educated at Clarendon House, Kensington, and in 1851 began his career as a novelist, though he frequently contributed special articles to periodicals and for five years wrote dramatic criticisms for the *Daily News*. He founded and edited *'Home Chimes'*, which ran as a weekly two years and then became a monthly. He was a prolific writer and over 50 titles of novels stand to his credit. Some of them are as follows: *'The House of Elmore'* (1855); *'One and Twenty'* (1858); *'No Church'* (1861); *'Female Life in Prison'* (1862); *'A Woman's Ransom'* (1864); *'Beyond the Church'* (1866); *'Stern Necessity'* (1870); *'Her Face Was Her Fortune'* (1873); *'Second Cousin Sarah'* (1874); *'The Romance*

*of a Back Street'* (1876); *'Lazarus in London'* (1885); *'The Keeper of the Keys'* (1890); *'The Secretary'* (1895); *'Sweet Nineteen'* (1896). His skilfully constructed and fluently told fictions were as popular in this country as in his own.

**Robinson, Henry Crabb**, English barrister and diarist: b. Bury St. Edmunds 3 May 1775; d. London 5 Feb. 1867. In 1796 he entered a solicitor's office in London, and in 1800 went to Germany, where he spent five years in studying at Jena and elsewhere, and in making the acquaintance of Goethe, Schiller, Wieland, Herder, Kotzebue, and other noted Germans. In 1807 he went to Altona as *Times* correspondent, and in 1808-9 was war correspondent in Spain for the same newspaper. He was called to the bar in 1813, and practised until 1828. He was associated with the foundation of the University of London in 1828. His fame as a conversationalist approached that of Rogers, but he never made any serious attempt to gain distinction as a writer. His intimate acquaintance with many of the greatest men and women of his time, both in his own country and on the Continent, gives peculiar interest and value to the selections from his *'Diary, Reminiscences, and Correspondence'*, edited by Sadler in 1869.

**Robinson, John**, English Independent clergyman. b. Lincolnshire about 1576; d. Leyden, Holland, 1 March 1625. It has been widely assumed that he was educated at Corpus Christi College, Cambridge. He was, say certain later writers, suspended from a benefice in Norfolk. He himself mentions a residence in Norwich, where he was religious director of a band of worshippers, and where certain persons were excommunicated for their interest in his instruction. In 1608 he emigrated to Amsterdam, with several of the congregation of the church at Scrooby Manor, Nottinghamshire, and thence in 1609 to Leyden, where he was ordained pastor, with William Brewster (q.v.) as ruling elder. In 1611 a building was purchased for 8,000 guilders for use as a meeting-house. Mather in his *'Magnalia'* says that "those famous divines, Polyander and Festus Hommius, employed this our learned Robinson to dispute publicly in the University of Leyden against Episcopius, and the other champions of that grand choke-weed of true Christianity" (Arminian doctrine). There may be some foundation for the story of such a disputation; but it was probably not at Polyander's request, nor at the university, where Episcopius was in power. Robinson was admitted to the university in 1615, and attended Episcopius' lectures. He took a very active interest in the project for emigration to America; and had a majority of his church volunteered, would have accompanied them hither. Previous to the sailing of the *Speedwell*, he preached on 21 July 1620, observed as a day of prayer and humiliation. His celebrated address is given in Winslow's *'Hypocrisis Unmasked'* (1646), the author remarking that Robinson "used these expressions, or to the same purpose," and some allowance must be made for such improvements and embellishments as Winslow may have made to suit his controversial purpose. Robinson corresponded with the "church of God at Plymouth, New England." Mather calls him "a most wise, grave, good man," and Robert Bailie, "the most learned, polished, and modest spirit" among

## ROBINSON

the separatists. His 'Works,' with memoir and notes of Robert Ashten, appeared in 1851. Consult also: Bradford, 'History of Plymouth Plantation' (Coll. of the Mass. Hist. Soc., 4th ser., Vol. III., 1856); Mather, 'Magnolia' (1702); Neal, 'History of New England' (1720); Brook, 'Lives of the Puritans' (1813); Dexter, 'Congregationalism of 300 Years' (1880); 'Life' by Davis (1903).

**Robinson, John Cleveland**, American soldier: b. Binghamton, N. Y., 10 April 1817; d. there 18 Feb. 1897. He entered West Point in 1835, but withdrew in 1838 to study law, accepting, however, a commission as 2d lieutenant in 1839. He was engaged in the Mexican and Seminole wars, was promoted captain in 1850 and at the outbreak of the Civil War was commissioned colonel of volunteers. He was in command of Fort McHenry at the opening of the war; successfully defended it, and was later engaged in organizing volunteer troops. He commanded a brigade in the Army of the Potomac in the Seven Days' battle before Richmond; was present at the battles of Fredericksburg, Chancellorsville, Gettysburg, Wilderness, and Spottsylvania, and in the last lost a leg and was prevented from further active service. He was voted a medal of honor by Congress; was brevetted major-general of volunteers in 1864, and of regulars in 1865. In 1866 he was mustered out of the volunteer service and accorded rank as colonel in the regular army. He was in command of the Department of the South in 1867, of the Lakes in 1868-9, and in the latter year was retired with rank of major-general. He was elected lieutenant-governor of New York in 1872, was commander-in-chief of the G. A. R. in 1877-8, and president of the Society of the Army of the Potomac in 1887-8.

**Robinson, Joseph Armitage**, English Anglican clergyman. He was educated at Cambridge, took priest's orders in the Established Church in 1832 and was vicar of All Saints, Cambridge, 1838-92. From 1893 to 1899 he was Norrisian professor of divinity at Cambridge, and was prebendary of Wells' Cathedral 1894-99. He was rector of St. Margaret's Westminster, 1899-1900, canon of Westminster 1899-1902, and in the year last named succeeded Dean Bradley as dean of Westminster Abbey. He has published 'A Collation of the Athos Codes of the Shepherd of Hermas' (1888); 'Appendix to the Apology of Aristides' (1891); 'The Passion of St. Perpetua' (1891); 'The Philocalia of Origen' (1893); 'Euthaliana' (1895); 'Unity in Christ' (1901).

**Robinson, Lewis Wood**, American naval officer: b. Camden County, N. J., 7 March 1840; d. Philadelphia, Pa., 16 Feb. 1903. He was graduated from the Polytechnic College of Pennsylvania in 1861, and entered the navy in that year as 3d assistant engineer in the West Gulf blockading squadron. He participated in the capture of Fort Jackson, Fort Saint Philip, and New Orleans; was engaged in the attack on Vicksburg and in the battle of Mobile Bay. After the war he continued in the naval service, was appointed chief engineer with rank of lieutenant-commander in 1883, became commander in 1895, captain in 1898 and in 1901 was retired with rank of rear-admiral.

**Robinson, Philip (Stewart)**, English journalist: b. Chunar, India, 1840. He was educated

at Marlborough College, engaged in teaching and in journalism, and was special correspondent of the London *Daily Telegraph* in the Afghan and Egyptian wars. He was also special commissioner of the *New York World* in 1881-2, and during the Spanish-American war was in Cuba as correspondent of the *Pall Mall Gazette*. He has published: 'In My Indian Garden' (1878); 'Sinners and Saints' (1883); 'Some Country Sights and Sounds' (1893); 'Birds of the Wave and Woodland' (1894); 'In Garden, Orchard and Spinney' (1897); etc.

**Robinson, Stillman Willhams**, American engineer and inventor: b. Reading, Vt., 6 March 1838. He was graduated from the University of Michigan in 1863, and for the three following years became assistant engineer in the United States Lake Survey. In 1866 he became attached to the University of Michigan in the department of geodesy and mining, and in 1870 was made professor of mechanical engineering at the University of Illinois, where he remained until 1878, when he assumed a similar post at the Ohio State University, and continued in its active duties until made professor emeritus in 1894. He has been an active inventor, and controls at least 40 patents. He invented the thermometer-graduating machine, and machines for shoe manufacturing, and has published: 'Teeth of Great Wheels and the Robinson Temple Odontograph' (1876); 'Railroad Economics' (1882); 'Strength of Wrought Iron Bridge Materials' (1882); 'Compound Steam-Pumping Engines, Analytical and Graphical Treatment' (1884); 'Principles of Mechanism' (1896); etc.

**Robinson, Stuart**, American Presbyterian clergyman: b. Strabane, near Londonderry, Ireland, 26 Nov. 1816; d. Louisville, Ky., 5 Oct. 1881. He was graduated at Amherst College in 1836, studied theology at Union Seminary, Prince Edward, Va., and was ordained in 1841. He was pastor at Kanawha Salines, W. Va., 1841-7, in 1856-8 professor of ecclesiology in the Presbyterian Seminary at Danville, Va., and then became pastor at Louisville. He edited the 'True Presbyterian,' which was suppressed by the government in 1862 for disloyalty, and he then removed to Toronto. In 1865 he published 'Slavery as Recognized by the Mosaic Civil Law, and Allowed in the Abrahamic, Mosaic, and Christian Church,' and in 1866 resumed his Louisville pastorate and reissued his paper as 'The True Christian Commonwealth.' His persistence in expressing his former views led to his expulsion from the Presbyterian general assembly, and by his influence the Kentucky synod joined the Southern general assembly in 1869, which body made him its moderator. He was a delegate to the Pan-Presbyterian council at Edinburgh in 1877. He wrote: 'The Church of God an Essential Element of the Gospel' (1858), and published 'Discourses of Redemption' (1866).

**Robinson, Theresa Albertine Louise von Jakob**, German-American author: b. Halle, Prussia, 26 Jan. 1797; d. Hamburg 13 April 1869. She was the second wife of Edward Robinson (q.v.), and was known in Germany as an author under the name of 'Talvi' (formed from her initials. While residing at Kharkoff she began to study Slavonic, and wrote her

first poems. In 1823 she published a few tales in a volume bearing the title 'Psyche.' She also published, in 1825-6, translations of a number of Serbian popular songs entitled 'Volkslieder der Serben.' In America she began the study of the aboriginal languages, and translated into German Pickering's work on the Indian tongues. In 1834 she wrote a 'Historical Review of the Slavic Languages' for the 'Biblical Repository,' republished in enlarged form in 1850. During her husband's visit to Palestine she resided in Germany, where she published, in 1840, 'Charakteristik der Volkslieder germanischer Nationen mit einer Uebersicht der Lieder ausseruropäischer Völkerschaften.' 'Die Colonisation von Neuengland' was published at Leipzig in 1847; a defective translation by W. Hazlitt, Jr., appeared in London in 1851. She also wrote numerous tales, and contributed to magazines, both German and English.

Robinson, William Callyhan, American jurist: b. Norwich, Conn., 26 July 1834. He was graduated from Dartmouth College in 1854; studied at the General Theological Seminary in New York, and entered the Episcopal ministry in 1857, but later studied law and was admitted to the bar in 1865. In 1869 he became instructor in the Yale Law School, and later professor of elementary and criminal law, and the law of real property. He was judge of the court of common pleas, New Haven, 1874-6, and member of the Connecticut legislature in 1874. Since 1895 he has been dean of the law school of the Catholic University of America. He has published: 'Notes of Elementary Law' (1876); 'Elementary Law' (1882); 'Law of Patents' (1890); 'Forensic Oratory' (1893); 'Elements of American Jurisprudence' (1900).

Robinson, Ill., city, county-seat of Crawford County, on the Wabash River, and on the Cleveland, C., C. & St. L. and the Illinois C. R.R.'s; 36 miles southwest of Terre Haute, Ind. It was settled in 1842, when it became the county-seat; was incorporated as a village in 1866, and as a city in 1886. It is the trade centre of a fruit and grain growing and sheep raising region, and contains a few small mills. It has two banks, with a combined capital of \$75,000, doing business to the amount of \$800,000 annually. It contains a public high school founded in 1885, with a school library of over 500 volumes (1903), and a Carnegie library. The city government is by a mayor and a council of six; the members of the council are elected for two years, three being chosen each year. Pop. (1900) 1,683; (1910) 3,863. G. W. HARPER,

Editor of the Robinson 'Argus.'

Robinson Crusoe, a world-famous tale by Daniel Defoe, published in 1719, and supposed to have been suggested by the experience of Alexander Selkirk (q.v.), who was shipwrecked and lived for years on a desert island. Crusoe, an Englishman, goes to sea in his youth, is captured by the corsairs, is shipwrecked and washed ashore on an uninhabited island, formerly supposed to have been in the Pacific, but recently satisfactorily identified with Tobago in the Caribbean Sea. The narrative consists of a careful description of his adventures and experiences during the 28 years of his exile. The first volume ends with the return of Crusoe to England, and met with such remarkable suc-

cess that the author, four months later, brought out a second volume, entitled 'The Farther Adventures of Robinson Crusoe'; and this in turn was followed, one year later, by a third, relating his 'Serious Reflections' during his wanderings. The simplicity of style and the realistic atmosphere pervading the narrative, have caused the popularity of this book to remain unimpaired.

Robison, John, Scottish scientist: b. Baldernock, Stirlingshire, 1739; d. Edinburgh 30 Jan. 1805. He entered Glasgow University in 1750. In 1758, as private tutor to the son of Admiral Knowles, he accompanied the expedition under General Wolfe for the reduction of Canada. In this situation, besides instructing his pupil, he was employed in making surveys of the coasts and harbors on the river Saint Lawrence. In 1763 he resumed his studies at Glasgow, devoting himself to mechanics, to which he was influenced by his acquaintance with James Watts, then employed in perfecting the steam-engine. In 1766 he was appointed to the chair of chemistry in the university. Admiral Knowles having been recommended by the British government to the Empress Catharine of Russia to superintend the improvement of her navy, Robison accompanied him as private secretary in 1770. In 1772 he was appointed by the empress inspector-general of the corps of marine cadets at Cronstadt. In 1773 he accepted the chair of natural philosophy at Edinburgh, which he continued to fill till his death. His writings include 'Elements of Mechanical Philosophy' (1804); 'A System of Mechanical Philosophy' (1822); and many contributions to the third edition of the 'Encyclopædia Britannica.'

Rob'john, William James ('CARL FLO-RO'), American musician and composer: b. Tavistock, Devonshire, 2 Nov. 1843. He came to New York in 1857, and in 1858-60 was first boy soloist at Trinity Church, New York. He afterward went on the stage as a singer, was organist in several churches, and also conducted opera in Havana and in New York. He organized the Palestrina Choir in 1886, and in 1889-91 was musical director of Wells College, Aurora, N. Y. His compositions include cantatas, overtures, symphonies, chamber music, and sacred music, in addition to the operettas: 'Inferno' (1871); 'Les Tours de Mercure' (1872); 'Suzanne' (1876); and the operas: 'Gilda' (1879); and 'Uncle Tom's Cabin' (1882).

Rob'sart, rōb'sirt, Amy, a character in Scott's novel, 'Kenilworth.' She is the unacknowledged wife of the Earl of Leicester, whom she follows to the castle of Kenilworth during the queen's visit; but there she is disowned, and is returning to her original place of concealment, when she meets the death prepared for her by Richard Varney.

Rob'son, Stuart, American actor: b. Annapolis, Md., 4 March 1836; d. New York 29 April 1903. His father's name was Charles Stuart, and he was christened Henry Robson Stuart. As a boy he acted as page in the House of Representatives during the 30th and 31st Congresses. Adopting the stage as a profession, he appeared first at the Baltimore Museum in 1852. He appeared in a play with William H. Crane in 1877 at the Park Theatre, New York, and their joint success led to a 12 years' partnership, during which time they produced 'Twelfth

Night,' 'The Comedy of Errors,' and 'The Merry Wives of Windsor,' besides other comedies and farces. In 1888 Bronson Howard wrote for them 'The Henrietta,' which was also played by Robson after their partnership ended. Plays in which he appeared as an independent star were 'Is Marriage a Failure?'; 'She Stoops to Conquer'; 'The Meddler' (1896) by Augustus Thomas; 'The Jucklins' (1900) by Opse Read.

**Roburite**, an explosive patented by Dr. Roth in 1887. It consists of dinitrochlor-benzene mixed with ammonium nitrate, and must be used dry. The detonation of the mixture is to be effected by means of fulminate of mercury. Roburite burns quietly, and is not sensitive to shock. Its most successful use has been in the mining of coal, where it is valuable not only because it causes little dust, but also because it allows of blasting the coal in large blocks.

**Robusti**, rô-boos'tè, Jacopo. See TINTO-RETO.

**Roc**, rôk, a mythical bird of enormous size, supposed to have been able to perform wonderful feats of strength and ferocity. The most popular accounts of the roc are given in 'The Arabian Nights' Entertainments, where the bird plays an important part in the fortunes of Sinbad the Sailor. Sinbad describes the roc as white, with a claw as large as the trunk of a large tree and with a beak of prodigious size and sharpness. Its egg, he declares to be 50 paces in circumference, about 150 feet. Another writer computes that the egg of the roc is equal to 150 hens' eggs. The bird is described as a bird of prey, 'able to bear an elephant away in its talons,' and 'killing the moa, which it bore to its nest and destroyed to provide food for its young.' See, in 'The Arabian Nights' Entertainments, the accounts of the second voyage, and the third Calendar's Story. Attempts have been made to identify the roc with the so-called elephant-birds of Madagascar and New Zealand, but it is asserted by naturalists that neither this huge bird (which is not a bird of prey) nor the *Harpagornis*, the largest known rapacious bird, could have performed the feats commonly attributed to the roc. There was described to the Parisian Academy of Sciences the fossils of an enormous bird called the *Epyornis* and two of its eggs, fossil remains of which had been discovered. (See reports for first quarter, 1851.) This little-known colossal has been accepted as the nearest approach to the fabulous roc.

**Roca**, rô'kâ Julio A., Argentine statesman: b. Tucuman, Argentina, 1 July 1843. He was trained in the Paraná military school, entered the army, and in 1874 became general. In 1878-80 he was war minister, and as such headed in person the expedition which subdued the Patagonian Indians. From 12 Oct. 1880 to 12 Oct. 1886 he was president of the republic. It was during his administration that the serious Argentine financial crisis occurred.

**Rocafuerte**, rô-kâ-foo-âr'tâ, Vincente, South American statesman: b. Guayaquil, Ecuador, 3 May 1783; d. Lima, Peru, 16 May 1847. He was educated in France and England, and in 1812 was elected to the Spanish Cortes by Guayaquil, but his opposition to the policies of Ferdinand VII. was resented, and he was obliged to escape to France. He went to Lima, and to

the United States in 1819, and in 1824 to Mexico, where he became secretary to General Michelena. He accompanied him to England, and after the recognition of Mexico's independence and Michelena's return, he remained in England as *chargé d'affaires*. In 1830 he resigned and returned to Mexico, where he edited the 'Fénix de la Libertad.' He went to Guayaquil in 1833, and was soon after elected deputy to congress for the province of Pichincha, but was exiled because of his opposition to the administration. The province of Guayaquil then revolted against General Flores and proclaimed Rocafuerte as supreme chief. He was defeated and captured by Flores, but an amicable arrangement was soon afterward made, co-operation in the reorganization of the republic was agreed upon, and Rocafuerte served as president in 1835-9. His administration was one of ability. He introduced many reforms, and placed the financial affairs of the country on a sound basis. His after life was spent in various diplomatic missions, in which he sustained his high reputation as a statesman. He wrote: 'Ideas necesarias á todo pueblo independiente, que quiere ser libre' (1820); 'Ensayo sobre tolerancia religiosa bajo el aspecto político y como medio colonización y de progreso' (1831); etc.

**Rocalla**, rô-kal-ê'. See ROCOCO.

**Rocambolo**, a species of onion (*Allium scorodoprasum*) having bulbs resembling those of the garlic, but the cloves are smaller. It is cultivated for the same purposes, and is considered as having a more delicate flavor.

**Rocha Pitta**, Sebastian, rô-bâs-tê-â'ôo rôsh'â pêt'tâ, Brazilian author: b. Bahia, Brazil, 3 May 1660; d. near there 3 Nov. 1738. He was a leisurely student, and the author of some commonplace verse and fiction. He made very elaborate preparations for his 'Historia da America Portuguesa desde o seu Descobrimento até o Anno 1724' (1730), which won for him deserved success and numerous honors. The book was the first history of Brazil in any true sense, and the material it contained has proved of much value to subsequent workers in that field.

**Rochambeau**, rô-shân-bô, Jean Baptiste Donatien de Vimeux, COMTE DE, French marshal: b. Vendôme 1 July 1725; d. Thoré 10 May 1807. He was the son of the governor of his native town and was brought up for the church, but at 17 entered the army. He fought with distinction in the war of the Austrian Succession, attained the rank of colonel and in 1749 followed his father as governor of Vendôme. During the Seven Years' war he did excellent service in Minorca (1756) and later in Germany, winning the rank of brigadier-general. He was made lieutenant-general in 1780 and in the same year was despatched at the head of an army of 6,000 men to co-operate with the American forces in the War of Independence. In July he landed in Rhode Island and, intrenching himself at Newport, held his position till June of the following year, when, in pursuance of a plan of campaign arranged between Rochambeau and Washington, the French troops, reinforced by some 3,000 men, marched across Connecticut and joined the American army on the Hudson, whence was begun the southward march for Yorktown. The city was invested on 29 September and after two

## ROCHDALE — ROCHFORD

brilliant assaults by the French troops and the defeat of the English fleet by the French under De Grasse in Chesapeake Bay, Cornwallis surrendered. Rochambeau's services to the American cause were enhanced by the utter absence of jealousy or self-assertion on his part; he placed himself implicitly under Washington's orders and within his own army maintained the sternest discipline. Congress voted its thanks to the French commander for his valuable services and presented him with two guns taken at Yorktown. Returning to France in 1783, he took part in the earlier events of the French Revolution and after being raised to the rank of field-marshal, was given in 1791, command of the Army of the North. Regarding with disfavor the progress of the Revolutionary policy, he resigned in June 1792 and soon after was imprisoned at Paris, regaining his liberty at the end of the Reign of Terror in 1794. In 1804 Napoleon made him an officer of the Legion of Honor. A statue of Rochambeau was erected at Vendôme in 1899, and a replica of it in Lafayette Square, Washington, was unveiled with much ceremony in 1902. He left behind him, 'Memoires du Maréchal de Rochambeau' (1890), translated, in part, into English (1838).

**Rochdale**, roch'dál, a market-town and parliamentary borough of England, in Lancashire, 10 miles north-northeast of Manchester. The parish church of St. Chad, finely situated on a lofty height, and approached from the lower part of the town by a flight of 122 steps, is a spacious and venerable structure of the 12th century (restored in 1837), partly in the late Norman and partly in the Perpendicular style, with a square embattled tower, several windows of rich tracery, and some very ancient monuments. Rochdale is a place of considerable antiquity, and had a Roman station in its vicinity. Its woolen manufacture appears to have been introduced by the Flemings in the reign of Edward III., and having continued to flourish, is mentioned as famous in the reign of Elizabeth. The Rochdale Co-operative Store, which has about 12 branches in the town, was the first society of its kind, and has served as a model for other co-operative societies.

**Rochdale Pioneers**, or **Rochdale Society of Equitable Pioneers**. See CO-OPERATION.

**Roche**, rôch, Alexander, Scottish artist: b. Glasgow 17 Aug. 1863. He began life as an architect, but turning his attention to painting, studied at Paris, and is now corresponding member of the Munich Secession. He has painted in landscapes and genre, and among his pictures are: 'Tête-à-Tête,' which carried off a gold medal at Munich in 1889; 'Fishers' (1891), bought by the Berlin Gallery; 'Landscape,' awarded a gold medal at Dresden (1897); 'Prue' (1902), bought by the Munich Gallery. He also executed the frescoes in the Banqueting Hall, Glasgow Municipal Building, 1900. He has published 'Finish in Art' (Transactions of the National Association for the Advancement of Art, 1889).

**Roche**, James Jeffrey, American author and editor: b. Mountmellick, Queen's County, Ireland, 31 May 1847; d. Berne, Switzerland, 3 April 1908. He was educated at Saint Dunstan's College, Charlottetown, P.E.I. In 1883-90 he was assistant editor of the Boston

'Pilot,' and editor-in-chief 1890-1905. He was U. S. consul at Genoa, Italy, 1904-7 and at Berne 1907-8. He published: 'Songs and Satires' (1886); 'The Story of the Filibusters' (1891); 'Her Majesty, the King' (1898); 'By-ways of War'; 'Sorrows of Sap'ed' (1904); etc.

**Roche**, Regina Maria (Dakton), Irish novelist: b. south of Ireland about 1764; d. Waterford 17 May 1845. She attained sudden fame in 1798 by the publication of her four-volume story, 'Children of the Abbey,' much in the fashion of the 'Mysteries of Udolpho,' which it rivaled in popularity. She then set to work on a long series of similar books—'The Nocturnal Visit' (1800); 'The Tradition of the Castle' (1824); 'The Nun's Picture' (1834), and a dozen others.

**Roche**, rôsh, Troilus de Mesgouat, MARQUIS DE, French colonizer in America: b. France 16th century; d. Brittany after 1600. In 1598 he received from Henry IV. letters-patent creating him lieutenant-general of Canada and adjacent islands, with power to establish colonies anywhere in North America. With a crew drawn largely from French prisoners, he set sail with one Chedotel of Normandy as pilot. After landing 40 of his force on Sable Island, he explored Acadia. Head winds prevented a landing at the island, on his return; and sailed on for France, where he was imprisoned for a year. Chedotel was ordered to go in search of the 40 followers, who had fortunately made their escape by means of wrecked vessels found on the coast.

**Rocheport**, Henri, ôh-rê rôsh-fôr (Victor HENRI, MARQUIS DE ROCHFORD-LUCAY), French journalist and politician: b. Paris 31 Jan. 1831. He became known as the author of successful vaudevilles and farces and as a contributor to *Charivari*, *Figaro*, and other Parisian periodicals, wherein his political reviews were marked by a brilliancy of wit and audacity of attack that brought upon him the resentment of the government. His assaults on Napoleon III. led the emperor to demand his expulsion from the staff of *Figaro*. Rocheport thereupon (1868) founded a weekly of his own, 'La Lanterne,' in which he continued his assaults on the government with unrivaled weapons of sarcasm and ridicule, beneath which the emperor and his ministers were helpless. The 'Lanterne' attained an enormous circulation, and when the editor was forced by repeated sentences of the courts to take refuge in Belgium, he continued its publication in a spirit all the more acrimonious. In 1869 he was elected to the Corps Législatif, and established the 'Marseillaise' with the professed object of combating the Second Empire. In January 1870 he was imprisoned for inciting to insurrection. After the fall of the Empire he became a member of the government of national defense, but was out of sympathy with the conservative tendencies of that body and strongly inclined to the radical element that afterward brought forth the commune. In May 1871 Rocheport fled from Paris, but was captured and sentenced by a court-martial to deportation. In 1873 he was transported to New Caledonia, but escaped in the following year, lived in Belgium and Switzerland, and renewed the publication of the 'Lanterne.' In 1880 he returned to Paris and founded the 'Intransigeant,' a periodical of virulent protest. He was deputy in 1885-6, be-

## ROCHEFORT — ROCHESTER

tame an ardent supporter of Boulanger, and in 1889 was sentenced to imprisonment, but escaped to England. He returned under amnesty in 1895, and attracted public attention as one of the most violent opponents of Captain Dreyfus (q.v.) in that celebrated affair. He published 'Les Aventures de ma Vie' (1896).

**Rochefort**, or **Rochefort-sur-Mer**, France, chief city of an arrondissement of the department of Charente Inférieure. It is notable for its naval and army institutions, and its well-built public works. It has two harbors—military and commercial. Napoleon purposed embarking for America from this point, but his plans were frustrated. The manufactures include tiles, beer, candles, artificial flowers, naval clothing. There are also various metal foundries, etc.

**Rochefoucauld**, rôsh - foo - kô, **François**, Duc de la. See **LA ROCHEFOUCAULD**.

**Rochegrosse**, Georges, zhôrz rôsh-grô, French painter: b. Versailles 1859. He studied at Paris, and developed under Lefebvre and Boulanger a powerful naturalistic style with an almost startling brilliancy of technique. His tendency to the brutal side of tragedy in his choice of subjects is, however, frequently revolting, and his pictures too frequently swim in blood. Among the best known and most characteristic are: 'The Death of Geta, Emperor of Rome,' and 'The Fall of Babylon.'

**Rochejacquelein**, rôsh-zhâk-lân, **Henri de la**. See **LA ROCHEJACQUELIN**.

**Rochelle**, rô-shêl', Ill., city in Ogle County; on branches of the Chicago, Burlington & Quincy railroad; about 70 miles west of Chicago, and 150 miles north of Springfield. It is the commercial and trade centre of a fertile agricultural region, in which stock-raising is an important industry. The manufacturing interests are connected with farm products. It has a high school, public elementary schools, and a public library. Pop. (1910) 2,732.

**Rochelle**, La, la rô-shêl', France, chief town of the Charente-Inférieure, a fine port and strongly fortified. It carries on a trade, the value of whose imports amounted in 1899 to almost \$13,000,000; its exports to more than \$5,000,000. Rochelle played an important role in the Reformation period, resisting many assaults, but was finally forced by famine to succumb (1628).

**Rochelle Salt**, sodium potassium tartrate, a white crystalline substance, discovered by Seignette, an apothecary of Rochelle, France. It has a mildly saline and slightly bitter taste, and is much used as a laxative, especially in seidlitz powders.

**Roches Moutonnées**, rôsh moo-tô-nâ', bosses of rock smoothed and rounded by glacial action. Such protuberances occur as scattered knobs and undulating surfaces in former glacial areas. Those little acted on by the weather generally show the characteristic glacial scratches and groovings. Some are smoothed and polished all over, and have the appearance of whales' or dolphins' backs; others are smoothed only on the side which faces the direction from which the glaciating agent flowed; the other side, protected from abrasion, being left in its rough unpolished condition. The name is fancifully

applied because such rocks in a valley bottom, when seen from above, have a seeming resemblance to the rounded backs of sheep lying down.

**Rochester**, rôch'ês-ter, **John Wilmot**, 20 EARL OF, English poet and courtier: b. Ditchley, Oxfordshire, 10 April 1647, d. Woodstock Park, Oxfordshire, 26 July 1680. On his father's death in 1658 he succeeded to his titles and estates, the latter of which he soon dissipated. Having studied at Oxford, he served with credit in the fleet under Lord Sandwich at the attack on Dutch ships in the harbor of Bergen, but subsequently gave himself up to dissipation, and became the personal friend and favorite of Charles II., who is said to have encouraged and shared many of his exploits. He frequently fell into disgrace at court, though his pardon was not long in forthcoming. His constitution at length gave way, and at 30 he was visited with all the debility of old age. He lingered for some time in this condition, and died, after sending for Bishop Burnet and professing great penitence for his misspent life. The volume of obscure verse purporting to be his contains much that is spurious. He was no better and rather worse than the lax writers of his day; but the edition of his poems brought out by his friends in 1691 contains such exquisite lyrics as entitle him to rank as the best song writer between Carew and Burns. He wrote the famous epigram on Charles II., asserting he "never said a foolish thing and never did a wise one."

**Rochester**, Nathaniel, American pioneer: b. Cope Parish, Westmoreland County, Va., 21 Feb. 1752; d. Rochester, N. Y., 17 May 1831. Having gone in 1763 to Granville County, N. C., he was made a member of the committee of safety for Orange County in 1775, in 1776 was a member of the first provincial convention in North Carolina, and was appointed by the convention a deputy commissary-general of military and other stores. He soon afterward resigned and was elected to the North Carolina legislature. In 1783 he established various manufacturing enterprises at Hagerstown, Md., and in Maryland became a member of the assembly, judge of the county court, and a presidential elector. Independently and in association with others, he purchased tracts of land in western New York, including (1802) one of 100 acres in Falls Town. He removed (1810) to Livingston County, near Dansville, and (1815) to Bloomfield, Ontario County. In April 1818 he went to Falls Town, which had been named Rochester in his honor; and in 1821-2 was the first representative of Monroe County in the State legislature. Consult **Rochester**, 'Early History of the Rochester Family in America' (1882).

**Rochester**, England, in the county of Kent, a river port on the Medway, 29 miles southeast of London. Its ancient castle (11th century) on an eminence overlooking the river, commands the view of a vast expanse of the surrounding country. The great tower of this ruined castle is one of the finest specimens of Norman architecture extant. The cathedral founded by Saint Augustine in 604 presents a mixed style, as it was destroyed by the Danes, and parts were added and remodeled subsequently at various epochs. There are many monuments of great antiquity. Of secular buildings, the town hall, exchange, municipal buildings

## ROCHESTER

and almshouses, schools, and Working Men's Institute are the most important. There is a large shipping trade, a steam-engine manufactory, and other industrial establishments, and lucrative oyster fishing. The town was founded by Ethelbert. The castle was built by Henry III. Henry VIII. visited Rochester, accompanied by Charles V., and Elizabeth spent five days there in 1573. Dickens introduces Rochester into 'Pickwick,' 'Edwin Drood,' and others of his novels.

**Rochester, Minn.,** city, county-seat of Olmsted County; on the Zumbro River, and on the Chicago & N. and the Chicago and G. W. R.R.'s; about 92 miles southeast of Saint Paul and 45 miles west of Winona. It was settled in 1854 by James Bucklin and Mr. Proudfoot, and incorporated as a city in 1858. The city was visited by a cyclone in 1883, which caused the death of 27 persons and the loss of a large amount of property. It is in a productive agricultural region, in which wheat is one of the principal crops. Considerable attention is given to stock-raising. The chief manufacturing establishments are flour and grist mills, a foundry, and machine shops. There are large grain elevators and stock yards. The principal buildings are the court-house, municipal building, Masonic Temple, Odd Fellows' building, opera house, Saint Mary's Hospital, a number of churches, and the convent of the Sisters of Saint Francis. The educational institutions are the high school, public and parish elementary schools, private commercial schools, Notre Dame de Lourdes Academy (R. C.), founded in 1877, and four libraries. The three banks have a combined capital of \$200,000; and the annual business amounts to \$1,500,000. The government is vested in a mayor, alderman-at-large, and a council of six members, three of whom are chosen by popular vote each year. Pop. (1910) 7,844.

A. W. BLAKELY,  
Editor 'Post and Record.'

**Rochester, N. H.,** city in Strafford County; on the Cochecho and Salmon Falls rivers, and on four railroads, all operated by the Boston & Maine railroad; about 30 miles east by north of Concord, and 35 miles northeast of Manchester. It was settled in 1722 by emigrants from England; incorporated as a town in 1722 and chartered as a city in 1891. It is the commercial and industrial centre of a large part of Strafford County; the chief manufacturing establishments are shoe factories, which have 1,000 employees; woolen mills, 400 employees; brick works, box factories, and other manufactories having fully 500 employees. The trade is chiefly in its own manufactures and in farm products. The principal public buildings are the Gaffney Home for the Aged, the 13 church buildings, and the schools. The educational institutions are a high school, public and parish schools, private commercial schools, and a public library. The three banks have a combined capital of \$150,000. The government is vested in a mayor and a council of 18 members. The members of the council hold office three years, six being elected each year. Pop. (1910) 8,868.

WILLIS M. DUFFY,  
Editor 'Rochester Courier.'

**Rochester, N. Y.,** city and county-seat of Monroe County, on the Genesee River and

the Erie Canal, and on the New York Central and Hudson River, the West Shore, the Lehigh Valley, and the Erie, and other railways; 239 miles west of Albany. Almost in the centre of the city are the Upper Falls of the Genesee. The city lies on a plateau, 263 feet above Lake Ontario, and is built on both sides of the river.

**The Genesee River.**—Midway through Rochester runs the Genesee, which is spanned by 10 bridges within the city limits, the middle one of which, built of stone, is enclosed by stores on both sides, but the others, of iron construction on stone piers, are open, affording beautiful and diversified views of the river, particularly from the northernmost bridge, whence can be seen a winding gorge nearly 200 feet deep. The sides of this display several distinct geological strata, showing the gradual formation of the earth, the red Medina sandstone being plainly visible as it rises from the water's edge for more than half the height of the precipice, when it gives place to successive layers of green shale, limestone, hematite iron ore, green and purple shale, and finally a topmost crust of limestone, all belonging to the Upper Silurian Age. At the point referred to are the lower falls, about 80 feet high, a curtain of water more beautiful, though less imposing, than the principal cataract, two miles farther back, in the centre of the city, from which, with its sheer descent of 96 feet, Sam Patch jumped to his death in 1829.

**The Erie Canal.**—Crossing the city from west to east is the Erie Canal, completed in 1825, which spans the river by means of an aqueduct of pleasing proportions, built of Lockport limestone at a cost of \$600,000. This canal, the surface of which at this point is 506 feet above tide-water, was, for many years after its construction, the great highway of commerce through the State, carrying to the eastern seaboard the cereal products not only of this region but of the growing West and enriching Rochester as well as other places on its banks. Wholly as a means of travel and largely as a medium of traffic its function was long ago appropriated by railroads, of which 11 enter the city.

**Parks.**—The Rochester Park Commission was created in 1888, since when work has been done so judiciously by the aid of the best landscape architects and nurserymen, taking advantage of the rolling lands that were obtainable, that few cities present so attractive an appearance in this regard; there are now three principal parks—the Genesee Valley, Seneca, and Highland—besides 11 smaller locations, making in all 666 acres of park territory.

**Public Buildings.**—There are four well-equipped hospitals—the City, Saint Mary's, the Homoeopathic, and the Hahnemann—besides a municipal hospital for contagious diseases and the insane asylum, or State Hospital. There are numerous hotels—of which the largest are the Powers, the Whitcomb, the Bristol, and the Osburn—and many apartment houses, which are greatly in demand. Of legitimate theatres there are four, the Lyceum and the Cook on the east side of the river, the National and the Baker on the west. Six daily newspapers are published here—the *Democrat and Chronicle*, the *Herald*, the *Union and Adver-*

## ROCHESTER

tier, the *Post Express*, the *Times*, and the *Abend Post*—besides a large number appearing less frequently. Of the social clubs the principal are the Genesee Valley, the Rochester, the Eureka, the Rochester Whist, and the Columbia Rifle; of literary clubs the leading ones are the Fundit, the Fortnightly, and the Wednesday Morning.

**Manufactures.**—Rochester was built up by the milling industry; the quality and amount of wheat grown in the valley during the early days made a demand for flouring-mills, which was strengthened by the presence of the high falls, so that those structures sprang up rapidly on both banks of the river and became so numerous that the place was long known as "the flour city" and its preeminence in this respect was recognized throughout the country. The development of the enormous wheat-fields of the West caused a decline in this business, so that its relative position was taken by the nursery industry; this was started here in 1838, after which it increased so that in 1904 there were more than 30 firms engaged in the business; besides the nurseries there are several large seed-houses, Rochester being the foremost city in the world in this regard; the first trees sent to California went from here in 1849. Rochester is the home of the camera, and practically all of the film cameras that are made in the world are manufactured here, as well as the great majority of plate cameras; in other photographic apparatus, in optical instruments, and in fruit canning it also leads all other places on the globe. Although Rochester is only the 24th city in the United States in point of population, it is the first in many things; it ranks third as to clothing, with an annual output of \$10,000,000, and fourth as to boots and shoes, with a production of \$7,000,000; its total manufacture exceeds \$70,000,000 annually, with over \$50,000,000 invested in that and the wholesale trades. The receipts at the post-office for a year are \$625,000; 640,000 tons of bituminous coal and over 360,000 tons of anthracite are consumed and shipped from here annually.

**Banking and Commerce.**—In the promotion of trade and in the inducement of outside manufacturers to locate in Rochester an important factor is the Chamber of Commerce, organized in June 1888, which now has a membership of 389. For providing the money necessary to carry on the business above indicated there are eight banks and five trust companies, with a combined capital of \$3,025,000, besides four savings banks, the total resources of all these institutions being \$103,124,410.73; the amount passing through the clearing-house in 1900 was \$194,385,300. For 1910 the assessed valuation of real estate was nearly \$165,500,000 (75 per cent of actual value), the tax rate \$1.93, and the net public debt \$12,742,267.

**Education.**—The Rochester Athenæum and Mechanics' Institute—generally known by the latter part of its title—was founded in 1884 as a free drawing-school and has so expanded that it now gives instruction in practical arts and sciences to about 4,000 pupils and ranks fourth among the technical trade schools of the country. The University of Rochester, founded in 1850 and located in beautiful grounds in the eastern part of the city, has a faculty of 93 instructors, with 264 students, and a library

of 41,000 volumes. There are also the Rochester Theological Seminary, of the Baptist denomination, founded in the same year, with a present faculty of 11, over 100 students, and 32,000 books; Saint Bernard's (Roman Catholic) Theological Seminary, occupying capacious grounds north of the city, started in 1893, having now 13 professors, 145 students, and 15,000 volumes, and the Wagner Memorial Lutheran College, chartered in 1885, having at present five professors and about 50 students. The public school system, under the control of a board of education of five members, is among the best in the country; it maintains 34 buildings, with 25 many principals; during 1903 there were 606 teachers, with 26,325 registered pupils; the East Side high school was lately completed at a total cost of \$322,000; the expenditures of the board are more than \$765,000. There are also 18 parochial schools and many private ones, including three academies—two of them for girls, one for boys—and one large institution for the instruction of deaf-mutes. The only free public library is the Reynolds, with 52,000 volumes, mainly books for reference and consultation.

**Churches and Charities.**—There are over 100 churches in Rochester. The first congregation (Presbyterian) was formed in 1815; the Roman Catholic diocese of Rochester was created in 1868. Of the seven cemeteries the oldest is Mount Hope, opened in 1838, remarkable for its natural beauty, owing to the undulations of the ground in every direction. There are five orphan asylums, three of which are under Catholic control, one under Jewish. In 1822 the Female Charitable Society was organized, from which have risen the kindred institutions of to-day, including, besides the hospitals and asylums, the Industrial School—not to be confounded with the State Industrial School, a large establishment for the reformation of young criminals—the Home for the Friendless, the Humane Society, the Children's Aid Society, the Society for the Organization of Charity, and a host of other associations for relieving distress, the most of which are connected, more or less directly, with the various churches.

**Public Service.**—In 1873 the Holly system of waterworks was introduced for fire protection. In the same year pipes were laid to Hemlock Lake, 26 miles away, by which water is obtained for drinking and other purposes that is unsurpassed, possibly unequalled, in its purity by any other city in the United States; 22,000,000 gallons are delivered daily; there are within the city limits 290 miles of distributing mains, with 300 miles of subsidiary pipe, and 3,050 hydrants; the total cost of the works was over \$7,500,000. The street cleaning is done by water-carts, instead of by the unsanitary means of dust-raising brooms. It is probably owing, partly, to the agencies just described that Rochester is one of the most healthful cities of the Union, the annual death rate during five years averaging 13 to the 1,000. The police force consists of 193 uniformed men; the fire department has 201 men, with 12 steamers and hose-carts, five truck companies, two chemical engines, one water tower, three separate hose companies, and one protective. The meteorological records of the past 33 years show that the mean annual temperature was 47.3, the mean maximum 55.4

## ROCHESTER.

## ROCHESTER—ROCHESTER THEOLOGICAL SEMINARY

the mean minimum 32.2, the absolute maximum 90, the absolute minimum 14 below zero, the mean annual precipitation 34.5 inches, the average number of clear days annually 83, partly cloudy 126, cloudy 156.

Rochester has always been free from overwhelming calamities. The worst two disasters, financially, in its history, in neither of which was a single life lost, were the great flood of 17 March 1865, when much of the city was under water for two days, doing a million dollars' worth of damage, and the fire of 26 Feb. 1904, which devastated a large portion of the dry goods district and inflicted a loss of \$3,000,000. Rochester has a well-equipped electric street car system, with 103 miles of track, besides the lines that run to surrounding villages in every direction. There are two telephone systems in the city, one owned by a foreign corporation, the other a home enterprise, which, though new, is very successful.

**History.**—In 1789 a saw-mill and a grist-mill were built on the west bank of the river by Ebenezer Allan—commonly called "Indian Allan," from his life-long association with the savages—who received, as compensation for the work, from Phelps and Gorham, the owners of the land, 100 acres surrounding those pioneer structures. Though no settlement was made at the time, that tract became the nucleus of the future city. In 1803 it was bought by Col. Nathaniel Rochester, Col. William Fitzhugh, and Maj Charles Carroll, all of Maryland, for \$17 50 an acre. Some scattered dwellings were built in the vicinity within the next few years, but no house was erected in what was then called Rochester, after the first-named proprietor, till 1812, when a log cabin was built on the spot that has ever since been known as the Four Corners. Other residences soon went up, in one of which the first white child was born, 2 Dec. 1814. Settlers from the New England States came pouring in and when the first census was taken in December 1815, the population was shown to be 331.

In 1817 it was incorporated as a village, under the name of Rochesterville, but in 1822 the title was changed to Rochester. In 1823 the size of the village was augmented by taking in a part of the town of Brighton, on the east side of the river, and subsequent additions have so increased the area that it now embraces 11,365 acres, with 325 miles of open streets, 126 miles of which are improved, with 230 miles of sewers. It was incorporated as a city in 1834, the first mayor being Jonathan Child. Rochester was the birthplace of modern Spiritualism, the famous Fox sisters having given here, in 1849, the first manifestations of mysterious rappings, which speedily became known as the "Rochester Knockings."

During slavery times Rochester was one of the centres of the Abolition movement and one of the principal stations of the "underground railroad." It was the home of Frederick Douglass, the celebrated negro orator, and was the place in which William H. Seward (q.v.), in 1858, uttered, in a public address, his memorable phrase in speaking of the struggle between freedom and slavery as an "irrepressible conflict between opposing and enduring forces."

**Population.**—In 1900, Rochester ranked 24 in the list of cities in the United States. The

population in 1880 was 1,500; (1885) 5,273; (1894) 12,252; (1880) 89,363; (1890) 133,898; (1900) 162,608; (1910) 218,149. This shows an increase between 1880 and 1900 of 21 per cent, and between 1900 and 1910 of 34 per cent.

**Bibliography.**—Bragdon, 'Notable Men of Rochester and Vicinity' (1902); Ward, 'Churches of Rochester' (1871); Peck, 'Landmarks of Monroe County' (1895); Parsons, 'History of Rochester Presbytery' (1889); Mathews, 'Fire Service of Rochester' (1888); Parker, 'Rochester, a Story Historical' (1884); Peck, 'History of Rochester' (1884); O'Reilly, 'Sketches of Rochester' (1838); Peck, 'History of the Police Department of Rochester' (1903); *Union and Advertiser Year Book* (1888-1903); *Annual Reports of the Rochester Chamber of Commerce* (1888-1903).

WILLIAM F. PECK,

Author of 'The History of Rochester.'

Rochester, Pa., borough in Beaver County; at the junction of the Ohio and Beaver rivers, and on the branches of the Pennsylvania railroad; about 25 miles northwest of Pittsburgh. It is connected by electric lines with Beaver, Beaver Falls, New Brighton, and other nearby places. A bridge across Beaver River connects the borough with Bridgewater. Also one across the Ohio connects the town with Monaca. It is in the coal and oil region, and in the vicinity are deposits of fire-clay and building-stone quarries. The chief manufactures are flour, lumber, brick, glass ware, foundry products, mining tools, structural iron, and oil well supplies. The principal public buildings are the churches, schools, and Masonic Temple. Pop. (1910) 5,903.

Rochester Theological Seminary, founded at Rochester in 1850 by the New York Baptist Union for Ministerial Education. As early as 1847 an attempt was made to remove Madison (now Colgate) University from Hamilton to Rochester, but this was opposed by the Baptists of Hamilton and legal obstacles were found, so that the plan was abandoned. The University of Rochester (q.v.) was established at the same time by the Baptists, and for a time the two institutions occupied the same buildings, but there has never been any organic connection between the university and the seminary, the latter being essentially a professional school. The regular course is three years; instruction is given in the departments of Hebrew language and literature (Old Testament), theology, church history, New Testament, homiletics and pastoral theology, elocution, English Bible, and Christian ethics. Graduation from college or preparation in Greek sufficient for the study of the Greek Testament is required for admission; formerly there was an English course for those who had no classical training; this was abandoned in 1889-90. In 1852 a German department was organized; the course is literary as well as theological, and covers six years. The seminary was at first without endowment, and at the end of 10 years had only \$75,000; in 1910 the productive funds amounted to \$1,691,000. The library is one of value, including the whole collection of Neander, the German church historian, and numbering 37,500 volumes. The total number of students including the German department was 167 in 1910.

**Rochester, University of.** See **UNIVERSITY OF ROCHESTER.**

**Roch'et**, the name given a lawn or lace garment, somewhat like the surplice in shape, but with close-fitting sleeves, worn by bishops, abbots, prelates, and other ecclesiastical dignitaries.

**Rochette, Désiré Raoul**, dâ-zé-râ râ-ool rô-shét, French archaeologist: b. Saint-Armand, France, 9 March 1790; d. Paris, France, 3 July 1854. He was educated at Bourges, removed to Paris in 1811, in 1815 became assistant professor to Guizot, whom he afterward succeeded in the chair of history at the Sorbonne. In 1826 he became professor of archaeology at Paris, and in 1838 was elected permanent secretary of the Academy of Fine Arts. He gained a wide reputation for learning, was popular as a lecturer, and enjoyed high favor after the Restoration. Besides his unfinished history of ancient art he wrote 'Antiquités du Bosphore Cimmérien' (1822); 'Tableau des Catacombes du Rome' (1837); 'Lettres archéologiques sur la Peinture des Grecs' (1840); 'Mémoire sur l'Acropole d'Athènes' (1845); 'Mémoires d'Archéologie comparée, Asiatique, Grecque, et Etrusque' (incomplete, 1848); etc.

**Rock Drills.** The steam or rock drill is known to-day as an American invention and its inception dates back to the excavation of the Hoosac Tunnel in Massachusetts. This enterprise was fathered during its period of construction by the State of Massachusetts and was beset with enormous difficulties. To commence the excavation of a tunnel five miles long through hard rock, and to do the drilling by hand, was an audacious proposition. Still this was undertaken by the State of Massachusetts. In those days of inexperience, many methods of excavation were proposed and tried. Machines were built, tested and condemned. Among the inventors, the man who schemed the machine which in general features embodied the requirements of a perforator for making holes for blasting, was Mr Fowle, of Boston. He constructed the first machine in which the drill used was made the extension of the piston rod of a reciprocating steam engine, which was moved forward toward the rock as the drilling advanced. The drill had a slow rotary as well as a reciprocating motion to insure the boring of a round hole. With this beginning, machines were improved in details, but operated without notable economy. The drills were heavy and could be used practically only when mounted on heavy carriages running on wheels on a track. They were much too heavy for mine or quarry work, although a few were used for such purposes.

Later came a demand for a lighter machine, and the Little Giant and Eclipse machines, both built by the Ingersoll-Rand Company, of New York, were found useful. The Little Giant was operated by a positive motion valve, and the Eclipse by a piston valve. With the introduction of light drills came various improvements which were found to be invaluable as the scope for the use of the rock drill enlarged. In fact, almost a new drill was made when the

machines were applied on a large scale in New York city for outside excavation at a tunnel under 42d street and under Hell Gate, and also in the hard ore mines of Lake Superior.

As soon as the rock drill attained a reasonable state of perfection, its improvement was immediately manifested to the world at large. It has often been called the advance agent of civilization, and it undoubtedly has a better claim to that title than any other mechanical invention of recent date. All modern engineering is dependent on its use, and problems which would be impracticable without this machine are rendered easy. Its influence on mining, quarrying, railroading and navigation has been felt all over the world. The rock drill has developed the mines of South Africa; and such modern engineering feats as the Hoosac and Mount Saint Gothard Tunnels, Hell Gate, Niagara Tunnel, the tunnel under Bergen Hill and the Palisades, the Croton aqueduct and the Chicago drainage canal were carried to success by rock drills. The work done by the rock drill may be said to be from 60 to 150 lineal feet of hole drilled per day of 10 hours in ordinary stone, including shifting and setting up of the drill, cleaning holes, etc. In tests and special cases the figures have been largely exceeded, sometimes as much as 400 lineal feet being made. Records of 24 inches per minute are not uncommon, all, of course, for down holes in favorable rock, but 70 feet per day of 10 hours in granite, including moving and setting up, averages a fair working basis. The cost of drilling in this way may be stated to vary from 2½ to 13 cents per lineal foot, according to local conditions. From four to five cents per foot of hole drilled may be taken as the working figure for general calculations, and this includes all expenses. Compared with hand methods, the cost of which runs from 25 to 70 cents per foot, with an average of 40 to 65 cents per foot of hole in hard rock, this shows that a given amount of drilling may be accomplished by the rock drill for from 1/10 to 1/12 the cost of doing it by hand. There are two distinct methods of machine drilling, one the auger drill, which bores the rock, and the other the percussion drill, such as the Little Giant or Eclipse, working by direct impact, that is, by striking repeatedly in the same spot and by simply bruising or chipping away the rock. Experience has proved that a reciprocating drill operates with the greatest economy and efficiency. The following are improvements made in the rock drill as used to-day.

Commencing with the cylinder of the drill, the method of using long bolts to hold the top and bottom heads in place with an elastic or spring buffer, whereby the blow (struck accidentally upon either head by the piston) is absorbed, may be placed first. The method of gripping the steel and the chuck by means of the "U" bolt and chuck key stands second. The device of flanged and rotating bar dropped through the ratchet box marked a great advance in the art. The use of the taper throttle was also a very neat device for preventing leakage and providing a graduated admission of the working fluid. In passing from the cylinder to its mounting the most important achievement was in the very simple device of mounting the drill on the horizontal arm attached to a vertical column, which in turn was

## ROCK EXCAVATING MACHINERY

mounted to a block and jacked in place by two screws, one on either end of the block. A kindred invention was the universal joint applied to the legs of a tripod.

The requirements of a perfect rock drill are numerous, but it should first of all be simple in construction and strong in every part. The parts as far as possible should be so arranged that any broken or worn portion may be easily removed and a new part substituted, causing the least possible delay in the work. The drill should occupy but little space and should be light enough for easily handling. The mountings on which it is set for different kinds of work should be easily put up and easily removed, insuring a great range of adjustability. It must, of course, be economical in its use of the driving fluid and must put down a hole in the shortest possible time.

**Surface and Underground Work.**—Surface work includes that class of excavation which occurs in open air, and underground operations include such borings as are underground. Surface drilling may be applied for opening up canals, for quarrying purposes, for opening up ways for railroads and similar undertakings. Such work may necessitate the use of tripod, column and shaft bar, quarrying machines, channelers, gadders and the like. Underground work necessitates the use of rock drills and compressed air machinery for purposes of sinking shafts, opening mines, etc. In shaft sinking and tunnel work, as in driving headings and enlarging, it has been found that the column is the best means of mounting rock drills. These columns are simply round, extra heavy, wrought steel tubes with a suitable claw-foot or rosette on one end and either one or two clamping or jack screws on the other. Stopping bars and tripods are also extensively used for special features.

**Submarine Work.**—Submarine or subaqueous rock excavation is essential for converting shallow rivers and harbors into navigable waterways. The conditions under which submarine rock excavation must be done are difficult to the last degree, calling for special apparatus of unusual strength and endurance. This character of work is nearly always carried on where tides, currents, winds and storms are present in a varying degree, and these elements are practical obstacles to rapid and economical work. But add to these troubles deep water, irregular bottom covered over with mud, sand and other shifting material, which fills in almost as fast as removed, and the undertaking is seen to be extremely difficult. In the early days, the usual method was to lower explosives to the surface of the rock and attempt fracturing by surface blasting. Later a form of drop bore was introduced by means of which holes were drilled and charges inserted as is at present done. Still another form consisted of a very heavy cast iron bar tipped with a sharp steel point, which was raised and allowed to drop. In operation the sharp point strikes the rock and is supposed to break off a certain amount with each blow. This system is used to some extent abroad, even to-day, but in America it has been abandoned entirely for the more progressive method of drilling a hole and inserting the charge of explosive the same as is done in rock excavation on land.

The removal of submarine rock is daily

becoming a more important feature owing to the increasing depth of ocean and lake-going vessels demanding deeper channels for harbors and rivers. A barge, scow or float fitted with a suitable frame to support the drill guides, drill, boilers and other auxiliary apparatus, is usually employed in submarine excavation. The barge is towed into place and anchored by means of cables, anchor chains or spuds, or a combination of these methods, depending upon the rise and fall of the tide, or the currents to be encountered. The form of framework depends largely upon the system used to feed the drills down, as the hole is cut into the rock. The height of the frame and the length of feed depend on the rise of tide and the depth of water over the rock and the depth to which the hole is to be drilled.

Various styles of mountings are employed in submarine excavation work. The drills used for such operations are generally of the heaviest type, as the work to be done is always severe and difficult. EDWARD F. SCHAEFER, M.M.E.,  
*Ingersoll-Rand Company, New York.*

**Rock Excavating Machinery.** In quarrying the most important machines are the channeler, the gadder, rock drill, air compressor, etc. To meet the varying requirements of different classes of work four styles of track channelers are manufactured.

**Upright Channeler.**—This consists of a truck mounted on four flanged wheels running on a track. Upon this truck is carried a boiler, (in the steam driven machine) or a reheater (in the air driven channeler) together with a powerful chopping engine mounted at one side on a frame of great strength. At the end of the piston rod of this engine are connected cutting steels which are driven against the rock by steam or air power in the engine cylinder.

**Swing Back Track Channelers.**—In machines of this type, the frame carrying the cutting engine swings on a hinge joint, giving an angular adjustment up to 45 degrees from the vertical in the bare machine, or 15 degrees in the outfit carrying the boiler or reheater. In addition to this movement the cutting engine swings in the plane of the frame, with an angular range up to 45 degrees either side of the vertical.

**Under Cutting Chambers** consist of a heavy frame of cast iron mounted on four wheels, carried on steel axles running in babbitted boxes. At either end of the frame is a special guide shell provided with a swinging adjustment in both horizontal and vertical planes by means of which all angular conditions may be met, and cuts carried clear into the corners. The shells are hung very low, thus giving the least possible offset in cutting. The use of the two shells permits the channeler to work close to the wall and adapts the machine to deposits of any angle or dip.

The **bar channeler** consists of a carriage supporting the cutting engine mounted on two parallel bars along which it is moved automatically by means of a three cylinder engine actuating a traveling feet nut. The engine is automatically reversed at each end of the travel; or the stops may be set at any intermediate point.

The **quarry bar** consists essentially of the

## ROCK FALLS—ROCK ISLAND

single bar mounted on four tripod legs, two on either end. On the bar is mounted a carriage which supports the drill and which may be moved along the bar by means of ratchet and pinion and operated by a hand wheel.

The *gadder* consists of a heavy solid cast iron body mounted on four wheels forming a truck running close to the floor of the quarry. To one end of the truck is hinged a standard or arm which can be swung from nearly horizontal to vertical and firmly locked in any desired position. On the swinging arm or standard is a sliding carriage on which may be mounted by means of a cone pivot and bolt, any one of several sizes of rock drills, according to the work to be done. To raise or lower the drill and move it along the slide a chain is attached to the saddle and run up and over a shaft at the end of the swinging arm and down to a small drum on which it is wound by turning a crank conveniently placed for the operator. A special taper gib or wedge clamp is fitted on the saddle, wherewith the saddle is firmly locked to the swinging arm by simply throwing down a small lever when the drill has been raised or lowered to the proper position. At each corner of the truck frame is a large pointed steel pin or pointer, slipping freely in a guide socket and when the machine is properly arranged a blow from a sledge on each of these pins anchors the truck in place.

See AIR COMPRESSORS; ROCK DRILLS; PUMPS, COMPRESSED AIR; PNEUMATIC TOOLS; MINING AND MILLING MACHINERY; COAL MINING MACHINERY; CRUSHING AND GRINDING MACHINERY; TOOLS AND TOOL-MAKING; ETC.

**Rock Falls, Ill.**, city in Whiteside County; on Rock River and on the Chicago, Burlington & Quincy railroad; across the river from Sterling, where connection is made with the Chicago & Northwestern railroad; about 110 miles west of Chicago. It was settled in 1867 by Augustus P. Smith. It is the commercial and industrial centre of the eastern part of the county south of Rock River. The water power is good; the chief manufactures are wire fencing, rivets, agricultural implements, butter tubs, flour, furniture, wooden-ware, wagons, carriages, and dairy products. The number of employees is about 1,000. There are seven churches, a high school, elementary schools, and a public library. The government is vested in a mayor and a council of six members, who serve two years; three members are elected annually. Pop. (1910) 2,657.

**Rock Fever.** See MALTA FEVER.

**Rock-fish**, the name of several fishes usually found about reefs and on rocky bottom. In the United States the most prominent one is the striped or rock bass (see BASS); another is a grouper (*Epinephelus adscensionis*) of the West Indies, called by English-speaking fishermen "rock-hind." The name applies on the Pacific coast to the whole family *Scorpanida*, represented in the Atlantic by the dory or rose-fish (*Sebastes marinus*), which looks somewhat like a perch in form, reaches a length of two feet, has a rosy hue, and is excellent for the table; it may be known by its nearly uniform orange-red color, and its spiny head. The genus *Sebastes* contains more than 50 species of

Pacific coast rockfish, and several are constantly brought to market. Says Jordan: "*Sebastes paucispinus*, the bocaccio, large and swift, is abundant in California. *Sebastes flavidus*, the yellow-tail rockfish, reaching a length of two feet, is one of the most valuable species. It is abundant from San Francisco to San Diego. *S. mystinus*, the black rockfish, is the most abundant species in rather shallow water about San Francisco. Another abundant species is the orange rockfish, *S. piniger*, found from Puget Sound to San Diego. It reaches two feet in length, and is a common market fish; and the rasher (*S. miniatus*) is another important species, reaching a length of two feet and abundant from San Francisco to San Diego. The red rockfish (*S. ruberrimus*) is the largest species of all, reaching a length of 2½ feet; it is abundant from San Diego to Puget Sound, and is a valued food fish. Another important species is the yellow-backed rockfish (*S. maliger*), which is found from Monterey to Sitka. It is especially abundant northward, and reaches nearly two feet in length. The Spanish flag, *Sebastes roboratus*, banded red and white, is perhaps the handsomest sea fish in our waters." Consult Jordan and Evermann, 'American Food and Game Fishes' (1902).

**Rock Hind.** See ROCK-FISH.

**Rock-hopper**, a rock wallaby or kangaroo (q.v.).

**Rock Island, Ill.**, city, county-seat of Rock Island County; on the Mississippi River, and on the Chicago, R. I. & P., the Chicago, B. & Q., and the Chicago, M. & St. P. R.R.'s; 180 miles west by south of Chicago, opposite Davenport (q.v.), Iowa, a few miles below Moline (q.v.), and 125 miles, in direct line, north by west of Springfield, the State capital. The city is named after the island in the river between the cities of Rock Island and Davenport. The United States government and the Chicago, Rock Island & Pacific railroad built a combined railroad and highway bridge from Rock Island city to the island and thence to Davenport. The original cost of this bridge was \$1,000,000. Another bridge connects Moline with the island, thus making the three cities ("The Triplets") one in many matters commercial and industrial. Rock Island has steamer connections with all the Mississippi ports. The island is three miles long, composed largely of limestone. A government arsenal and armory are on the island. That portion of the river between the island and Davenport is navigable, but on the west side of the island the river has been dammed by the United States government, thus furnishing Rock Island, Moline, the island, and Milan (a few miles below the city) with extensive water-power, which has contributed to the development here of a large and important manufacturing centre. Rock Island has excellent transportation facilities which make it of importance as a commercial city.

The chief industrial establishments are the arsenal, in which there are 2,000 employees; plow factory, which has 800 employees; lumber mills, 1,000 employees; railroad employees 500; brewery, 150 employees; oil-cloth factory, 150 employees, and a number of smaller industries which give employment to some hundreds of persons. The prominent public buildings are the

## ROCK KANGAROO—ROCKEFELLER

government arsenal, with \$10,000,000 of improvements; the court-house, which cost \$175,000; the high school, \$125,000; the library, \$75,000; Saint Anthony's Hospital; the 20 churches, and a number of fine business blocks. The Davenport mansion, on the island, is of historic interest. The educational institutions are Augustana College (Lutheran), opened in 1860, Villa de Chantal (Sisters of the Visitation), public and parish schools, several private schools, one city library, and three school libraries. The five banks have a combined capital of \$400,000. The government is conducted on the commission plan, Little Rock being (1911) one of 17 cities of this state so governed.

Rock Island was settled in 1826 by Colonel George Davenport. It was platted in 1835, and called Stephenson. In 1841 it was united with Farnhamburgh under its present name, and in 1849 was chartered as a city. When Colonel Davenport built his home on the island, in 1833, the neighboring places were a fort and an Indian trading post. Prior to his settling in this locality, in 1826, he had been there in 1816 with the government troops, when Fort Armstrong was established. Black Hawk, the Indian chief, often visited him here, and many of the people who are now regarded as "history makers" often visited Davenport in his island home. During the Civil War, the prison here was the place of detention of many Confederate prisoners. When the Mississippi Valley began to change from a raw producing region to a section sending to the world the finished and polished product of the best in manufacturing methods, Rock Island was among the leading cities which were quick to welcome the railroad and the manufactory, and the first to use the improved means presented to extend the commerce of the city. Pop. (1880) 11,659; (1890) 13,634; (1900) 19,493; (1910) 24,335.

H. P. SIMPSON,  
Editor 'Rock Island Argus.'

**Rock Kangaroo or Wallaby.** See KANGAROO.

**Rock-melon.** See MELOWS.

**Rock Ptarmigan.** See PTARMIGAN.

**Rock-rabbit.** See HYRAX.

**Rock Rapids,** Iowa, town, county-seat of Lyon County; on the Rock River, and on the Illinois C., the Burlington, C. R. & N., and the Chicago, St. P., M. & O. R.R.'s; about 58 miles north of Sioux City. It is in an agricultural and stock-raising region. It has considerable manufacturing interests connected chiefly with farm and dairy products. It is the commercial centre of a large part of the county. Pop. (1910) 2,000.

**Rock River** rises in the State of Wisconsin, 50 miles west of Lake Michigan; it flows south-southwest, receives several tributaries, enters Illinois, and crossing the State in a south-westerly direction, flows into the Mississippi a little below Rock Island. Its whole length is estimated at 330 miles, about 225 of which have been ascended by small steamers, though with some difficulty, owing to the various rapids. The region which it drains is one of great fertility.

**Rock-roses.** See CISTUS.

**Rock Salt.** See SALT.

**Rock-snake,** a name among English colonists for pythons generally; especially for *Python regius* of southeast Africa, which sometimes grows to a length of 15 feet.

**Rock-soap,** a hydrated silicate of aluminum, containing peroxide of iron and water. It is a variety of halloysite, is found only massive, is earthy, easily broken, black or nearly so, very soft, somewhat greasy to the touch, and adheres strongly to the tongue. Rock-soap is used for crayons, and is also useful, by reason of its saponaceous properties, in the washing of cloths, etc.

**Rock Springs, Wyo.,** in Sweetwater County; on Bitter Creek, and on the Union Pacific railroad; about 250 miles west of Laramie. It is on a plateau, in a mountainous region in which there are extensive coal fields. The principal industries are connected with the mining and shipping coal. There are two banks, which have a combined capital of \$125,000. The educational institutions are a public high school, public and parish elementary schools, and a high school library. Pop. (1880) 763; (1890) 3,406; (1900) 4,363; (1910) 5,776.

**Rock-temples.** In many parts of western India, as at Ellora, Elephanta, Karli, and Salsette Island, natural rocks have been cut into temples; as also into caves and forts. Out of India well-known instances of the same kind occur at Petra, in the Arabian Desert, at Abu-Simbel, in Egypt, and in China and Siam. See also CAVE-DWELLERS.

**Rock-trout,** a valuable fish (*Hesagrammus decagrammus*) of the coast of California and northward. It is one of the greenlings (q.v.), and is known northward as boregat and bodieron. It reaches a length of 18 inches, and is regarded as an excellent food-fish.

**Rock-work.** See MASONRY.

**Rock-wren,** a grayish-brown migratory wren (*Salpinctes obsoletus*) of the Rocky Mountain region which haunts the mountain gulches and makes a big rough nest in some rift of rock, or on a ledge. It has a charming song, and is likely to come familiarly about the mountaineer's cabin. Consult Coues, 'Birds of the Southwest' (1878).

**Rockall Islet,** in the North Atlantic Ocean, 160 miles west of Saint Kilda, 260 miles north of Ireland, and 290 miles west of the mainland of Scotland, is an isolated conical rock of stratified granite, 100 yards in circumference, rising 70 feet above the sea, from a sandbank about 50 miles long and 25 miles broad. The vicinity is a cod-fishing ground for Scotch and English fishermen. The first known landing was made in 1810, and the islet was the object of a scientific expedition in 1896.

**Rockefeller,** rŏk'ə-fĕl-er, John Davison, American capitalist: b. Richford, Tioga County, N. Y., 8 July 1839. After an education in the public schools of Cleveland, he there entered a mercantile establishment as clerk, and subsequently was made cashier and bookkeeper. In 1858 he became a member of the firm of Clark & Rockefeller, and in 1860 the concern entered the oil business as Andrews, Clark & Company. The firm, its style having been changed to William Rockefeller & Company, built the

## ROCKEFELLER—ROCKEFELLER FOUNDATION

Standard oil works at Cleveland in 1865, and in 1867 the various interests with which John and his brother William were connected were consolidated into one corporation. In 1870 the Standard Oil Company was incorporated, with John Rockefeller as president. Increasing business led to the formation in 1881 of the Standard oil trust, which, however, was dissolved in 1892. Since that time Rockefeller has continued in control of the various separate companies in which he is the principal stockholder. His chief gifts have been to the University of Chicago; these, unconditional and conditional, aggregating more than \$200,000,000. He presented also to Cleveland real estate and cash to the value of \$600,000; to Vassar College a \$100,000 building and 3,000 volumes on Greek art and literature; to Tarrytown, N. Y., \$50,000 for a high-service water tower; to the American Baptist Missionary Union, \$400,000; and to Barnard College, \$1,375,000; to the General Education Board (total) \$43,000,000; etc.

**Rockefeller, John Davison, Jr., capitalist:** b. in 1877. He was graduated from Brown University in 1897, and has since been associated with his father in business enterprises; is also interested in philanthropic and church work.

**Rockefeller, William, capitalist:** b. Richford, N. Y., 31 May 1841. After schooling at Owego, N. Y. and Cleveland, O., he became a bookkeeper and afterward a partner in a produce commission business. He became associated with his brother, John D. Rockefeller when the latter became established in the oil business, and since 1865, William Rockefeller has been at the head of the business in New York, and is (1910) president of the Standard Oil Co. He is vice-president of the Standard Oil Co. of New Jersey, trustee of the Anaconda Copper Mining Co., the Consolidated Gas Co., and the United States Trust Co. On the board of directors of many railroads, among others the New York Central and Hudson River R. R. Co., the Lake Shore and Michigan Southern Ry. Co., the New York, New Haven and Hartford R. R. Co., the Chicago, Milwaukee and St. Paul Ry. Co., and the D. L. and W. R. R. Co.; is also director of Amalgamated Copper Co., the Poughkeepsie Bridge R. R. Co., the National City Bank, the Hanover National Bank, the National Transit Co., the New York Mutual Gas Light Co., the Brooklyn Union Gas Co., and many others.

**Rockefeller, William Goodsell, capitalist:** b. 1870. After graduation from Yale, in 1892, he was made treasurer of the Standard Oil Co., of New York, and has been elected director in the Brooklyn Union Gas Co., the Lincoln National Bank, the Columbia Bank and other financial institutions.

**Rockefeller Foundation.** In March 1910 Mr. John D. Rockefeller set on foot a scheme to distribute a large amount of his wealth, for the avowed purpose of uplifting humanity all over the world, by organizing his philanthropic work through the United States Government. At his request Senator Gallinger introduced a bill in the Senate creating the "Rockefeller Foundation," which in the language of the bill, was "to promote the well-being and advance the civilization of the peoples of the United States and its territories and possessions, and of foreign lands, in the acquisition and dis-

semination of knowledge, in the prevention of suffering, and in the promotion of any and all the elements of human progress." It was generally understood at that time that Mr. Rockefeller intended to limit his gifts of money thereafter to this Foundation, but such has not proved to be the case. His son, John D. Rockefeller, Jr., who was named as one of the incorporators of the project, announced that he intended to devote his life to the management of the Foundation.

The bill was severely criticised by Hon. John Bigelow, by Edward T. Divine, by President Jacob Gould Schurman of Cornell, and by many others. In an address before the National Association of State Universities, on 15 November, President Schurman said:

"Under the terms of this proposed board charter, there is scarcely anything which concerns the life and work of individuals and nations in which the Rockefeller Foundation would not be authorized to participate. As the safety of the State is the supreme condition of national civilization, the Foundation might in time of war use its income or its entire principal for the defense of the republic. In time of peace it might use its funds to effect economic and political reforms which the trustees deemed essential to the vitality and efficiency of the republic. The Foundation might become the champion of free trade or protection, of trusts or of the competing concerns out of which they grow, of socialism or individualism, of the programme of the Republican party or the programme of the Democratic party.

"It might endow the clergy of all religious denominations or it might subsidize any existing or any new religious denomination. Tomorrow it might be the champion of the Christian religion and 100 years hence furnish an endowment for the introduction of Buddhism into the United States. It might build tenement houses for the poor in New York city or carry the results of sciences to enrich the exhausted soils of the East or the arid tracts of the West. It might set up an art gallery in every city of the United States or endow universities which would rival the great universities of the West.

"These may be likely objects for the application of the funds of the Rockefeller Foundation. I am not, however, attempting to forecast its work, but to understand its charter. And as far as I can see the proposed charter would authorize all of these and a multitude of similar activities.

"Although these are large powers I for one should have no hesitation in entrusting Mr. Rockefeller with them. The experience we have had of his philanthropy shows that he would use them wisely. Vast and comprehensive, therefore, as the scope of this Foundation is, I would not in any way limit or restrict it so long as it was in charge of Mr. Rockefeller or even of his son and his expert coadjutors.

"After they have passed away, however, the situation would be entirely changed. We know nothing about the kind of man who may succeed him, and the objects of the Foundation remaining as important and comprehensive as they are I am decidedly of the opinion that the public should have a right to a voice in the selection of the board after Mr. Rockefeller's direct influence has passed away."

## ROCKEFELLER FOUNDATION

Doctor Schurman said that self-perpetuating boards were practically things of the past in all large institutions and that almost no college or university of to-day is governed entirely by a board so selected. He added: "The plan of a self-perpetuating board for the Rockefeller Foundation is at once contrary to the general practice of our great universities, and, as it seems to me, contrary to the spirit of our age and of our country. A self-perpetuating and irresponsible board wielding enormous powers is from the point of view of efficiency a blunder, and from the point of view of democracy an anomaly, if not indeed a defiance."

Doctor Schurman favored a governing board selected somewhat as in the case of the Smithsonian Institution, which is conducted by a board of regents composed of the Vice-President, the Chief Justice of the United States, three members of the Senate and three members of the House, together with six other persons other than members of Congress, two of whom shall be residents in Washington, and the other four inhabitants of some State, but no two of the same State.

The objection was urged against the bill by the charitable organ *The Survey*, that it would place great resources indefinitely at "the uncontrolled disposal" of a small group of men. Doctor Dime, editor of *The Survey* suggested three amendments as safeguards against abuse. The first was: "The Government should have a voice—naturally by the election of Congress or appointment of the President—in the selection of trustees." His second point was: "It should be stipulated that the annual income during the life of the endowment should actually be expended for the purposes enumerated in the charter, the indefinite increase of the endowments through compound interest being forbidden. His third point was: "That within a specified period, which might properly be 100 years or more, any given endowment should be entirely expended, both principal and interest."

On 12 December, Senator Gallinger introduced a bill providing for various amendments to the proposed charter for the Rockefeller Foundation, to meet the objections that had been raised against it. The total amount of property to be held at one time was limited to \$100,000,000, exclusive of increases in value subsequent to its receipt. To prevent the accumulation by the board of trustees of vast wealth under the charter it was provided that the income from the funds should not be accumulated, but must be expended as soon as a wise administration of the act would permit. Congress was given the power to place limitations upon the use of the fund or property at any time in the future as Congress may deem best for the public interest. Notice of the election of a new member to fill a vacancy in the corporation was required to be sent to the President of the United States, the Chief Justice of the Supreme Court, the President of the Senate, the Speaker of the House, and the presidents of Harvard, Yale, Columbia, Johns Hopkins, and the University of Chicago. The election was to be void if disapproved by a majority of these referees, and it was to become effective when approved by a majority after 60 days. It was also proposed in the amendments

that Congress may at any time "impose such limitations upon the objects of the corporation as it may deem the public interest demands" and that any and all gifts and bequests of property "shall be received and held subject to the terms of this proviso and to the terms and limitations which may be imposed by any act of Congress hereafter passed." In effect, Mr. Rockefeller proposed to give into the absolute control of the United States for philanthropic purposes the bulk of his great fortune.

Rockefeller Institute for Medical Research. This institution was incorporated 14 June 1901, with Dr. William H. Welch, of Baltimore, president; Dr. T. Mitchell Prudden, of New York; Dr. Christian A. Hester (since died in 1910); Dr. Theobald Smith, of Boston; Dr. Hermann M. Briggs, of New York; Dr. Simon Flexner and Dr. L. Emmett Holt, of New York (secretary and treasurer), for a board of scientific directors. Mr. Rockefeller pledged \$200,000 to the board to be drawn upon at their discretion during a period of 10 years, for preliminary work, his letter of gift expressing his desire "to accomplish the most for humanity and science." Scholarships and fellowships were created and distributed to the existing laboratories throughout the country, to enlist the cooperation of various investigators, to aid some promising lines of research which could not previously be continued for lack of funds, and to discover who and where were the persons who desired to undertake research work and what were their qualifications. At the end of the first year it was decided to centralize the most important lines of work in the Institute's own laboratory under a competent head, and with special equipment. Mr. Rockefeller gave \$1,000,000 at the second annual meeting of the board in June 1902 for this object. The Schermerhorn property, fronting East River at East 66th and 67th streets, New York, was chosen for the site, and a plot comprising 26½ city lots, upon which the present building stands, was deeded to the Institute. Dr. Simon Flexner resigned his position as professor of pathology in the University of Pennsylvania to become director of the Institute and began his work 1 July 1903. The cornerstone of the building was laid 3 Dec. 1904, a building at the corner of Lexington avenue and 50th street being used temporarily.

The present organization provides for the following departments: pathology, bacteriology, physiological and pathological chemistry, physiology, comparative zoology, pharmacology, and experimental therapeutics.

The purpose of the Institute is research, not instruction; yet it exerts a considerable influence on medical education. Upon the basic sciences above mentioned the future discoveries on medical science must largely rest. The Institute endeavors to apply the latest discoveries in science to problems connected with the prevention and cure of disease.

The Institute has cooperated with the Health Department of New York in the study of conditions surrounding the production and distribution of the milk supply of the city, and the effects of milk upon the health of children in the tenements; also with the commission appointed by the city in 1904, to study the prevalence of the acute respiratory diseases, and

## ROCKET — ROCKHILL

with that appointed in 1905 to investigate cerebro-spinal meningitis. It has united with Harvard University in sending men to Manila to study certain phases of smallpox; and it has made grants each year to assist important investigations which were being carried on in various places.

The work done by the Institute is published in various scientific journals and collected in volumes of 'Reprints.' In Feb. 1905 the Institute took charge of the publication of *The Journal of Experimental Medicine*.

Mr. Rockefeller gave an additional \$3,800,000 when the hospital of the Institute was opened on 7 Oct. 1910. This made the income bearing endowment \$6,420,000, and the total endowment including grounds and buildings \$8,240,000. In the hospital the closest scientific study is given to obscure pathological conditions such as heart disease, pneumonia and infantile paralysis. The board of trustees of the Institute consists of John D. Rockefeller, Jr., Frederick T. Gates, William H. Welch, Starr J. Murphy, and Simon Flexner.

**Rocket**, the name of several plants; one salad plant, chiefly used by Italians, is the *Brassica eruca*; the yellow rocket is the common winter cress, *Barbarea vulgaris*; but the sweet or dame's rocket is the most widely known. It is a tall perennial, with purplish or white single flowers in a loose raceme, and fragrant at night, much used in old-fashioned gardens.

**Rockets**. See **PROJECTILES**.

**Rockford**, rŏk'fŏrd, Ill., city, county-seat of Winnebago County; on the Rock River, and on the Chicago & N. W., the Chicago, M. & St. P., Chicago, B. & Q., and the Illinois Central R.R.'s; 81 miles northwest of Chicago. It was settled in 1834, being the first settlement in the county; and was incorporated as a city in 1853. In 1890, it obtained a considerable increase of territory by annexation. It is built on both sides of the river, which is here crossed by three railroad and three highway bridges. A dam 800 feet long across the river secures excellent water power for manufacturing, and the city is one of the most important industrial centres of northern Illinois. The chief manufactures are agricultural implements and furniture; others are pumps, watches, silver-plated ware, knitting wool, paper, flour, and grape sugar. According to the census of 1900 the manufacturing establishments numbered 450, with a capital of \$14,126,834; in 1904 the number of employees was about 13,000. There are six banks with a combined capital of \$650,000, doing an annual business to the amount of \$22,069,727.53 (clearing-house, 1903). Rockford is surrounded by a fertile agricultural region, and with its railroad facilities is an important shipping point for the products of this district. The city is well built with wide regular streets; among its notable public buildings are the Memorial Hall for Soldiers, the city-hall, the court-house, two hospitals and the public library; the library contains over 20,000 volumes. The public school system is of the best, and includes a high school, organized in 1857; there is also a Roman Catholic parish school; and the city is the seat of Rockford College (for women) and of Brown's Rockford Business College. The government is

vested in a mayor and a council of 15, elected biennially; the council has the power of appointing the city officers. There is an excellent water supply from five artesian wells, and the waterworks are owned and operated by the municipality. Pop. (1900) 31,051; (1910) 45,401. Consult C. A. Church, 'History of Rockford and Winnebago County, Illinois' (1900).

J. STANLEY BROWNE,  
Editor 'Morning Star.'

**Rockford College**, a college for women, located at Rockford, Ill. It was founded in 1849 as a seminary, and received its college charter in 1892. It has a collegiate department, department of music, and preparatory department; the collegiate work is in two courses, classical and general scientific, for the completion of which the degrees of A.B. and B.S. are conferred. In 1910 the ground and buildings were valued at \$150,000; the productive funds amounted to \$147,000, and the annual income to \$61,000. In 1910 the students numbered 174, and the instructors 27.

**Rockhampton**, rŏk'hămp'tŏn, Australia, capital of the county of Livingstone, Queensland, on the Fitzroy River, about 420 miles by rail northwest of Brisbane, almost on the Tropic of Capricorn. It is enclosed by hills, and is the gateway to rich pasture lands, and the adjacent Mount Morgan mineral fields. It has considerable river traffic with the ports of Alma and Broadmount at the mouth of the river, 35 miles distant.

**Rockhill**, William Woodville, American diplomatist: b. Philadelphia 1 April 1854. He was educated at the Lycée Bonaparte and the Collège de France, Paris, and was graduated from the military school of Saint Cyr in 1871. He served with a French regiment in Algeria but returned to the United States in 1876. In 1881 he returned to France and resumed his oriental studies begun during his college course, and in 1884 entered the diplomatic service as 2d secretary of legation at Peking, China. He was *chargé d'affaires* at Seoul, Korea, 1887-8; visited China, Mongolia and Tibet during 1888-92 on exploring tours; was appointed chief clerk of the State Department in 1893; was made 3d assistant secretary of state a year later; and 1st assistant in 1896. He was minister to Greece, Rumania and Serbia, 1897-9, and the following year went as United States commissioner to China, where in 1901, under appointment as special ambassador, he signed the final peace negotiation. In October 1901 he resumed his duties as director of the Bureau of American Republics to which he was appointed in 1890. He has published 'Udanavarga, the Northern Buddhist' (1883); 'A Life of Buddha, and the Early History of his Church' (1884); 'Land of the Lamas' (1891); 'Diary of a Journey in Mongolia and Tibet' (1893).

**Rockhill**, S. C., town in York County; on the Southern and the South Carolina & G. E. R.R.'s; about 25 miles south-southwest of Charlotte, N. C. It is in a fertile agricultural region in which cotton is one of the principal products. The principal industries are connected with cotton and farm products and lumber. The Winthrop Normal College, with about 500 students, is located here. The banks

## ROCKING STONE—ROCKLAND

have a combined capital of \$150,000. Pop. (1910) 7,216.

**Rocking Stone**, or **Loggan-stone**, a block of stone, or a mass of rock, often of great size and weight, so nicely poised on a lower mass that it can be moved backward and forward with but little force. Some rocking stones are evidently artificial, others natural. The former appear to have been contrived by cutting out a mass of rock round the centre-point of the base of the block. The latter are generally granitic rocks, in which porphyry and feldspar are abundantly found. These ingredients being rapidly decomposed, and the sand and dust swept away by wind and rain, what was originally a solid rock becomes a group of pillars of irregular shape, separated by horizontal and vertical fissures. Gradually the edges of the block forming the pillar decay, and it assumes the appearance of two or more spheroidal rocks, one resting on the other. When the upper mass is so situated as to preserve its equilibrium notwithstanding the gradual wearing away of the base, a rocking stone is the result. Rocking stones occur in nearly all countries. In Great Britain they are found in Cornwall, Derbyshire, Lancashire, Yorkshire, and Wales, in the shires of Perth and Kirkcudbright, Scotland, and also in many places in Ireland. Much larger than any of these, however, is the rocking stone of Tandil in Argentina, 250 miles south of Buenos Ayres, which weighs over 700 tons, yet is so poised that it rocks in the wind and may be made to crack a walnut. Rocking stones are supposed to have been employed in ancient times for purposes of divination, the favorable or unfavorable oracle being determined by the number of vibrations. Consult Vincent, 'Around and About South America' (1890).

**Rockingham**, rōk'ing-am, Charles Watson-Wentworth, MARQUIS OF, English statesman: b. 13 May 1730; d. 1 July 1782. He was educated at Westminster School and Saint John's College, Cambridge, and in 1750 was created an Irish peer under the titles of Baron and Earl of Malton, later in the same year becoming also an English peer and Marquis of Rockingham by succession. He took his seat in the House of Lords in the following year and continued in practice with his Whig sympathies which he had inherited from his father. He took little part in politics, being a hesitating speaker and of mediocre talent, until 1765 when on the refusal of Pitt to take office, he became prime minister. His large wealth and powerful family position contributed to his elevation, and he had the invaluable assistance of his brilliant secretary, Edmund Burke. He took a friendly attitude toward the American colonies and favored the repeal of the Stamp Act, though he affirmed the right of Parliament to tax the colonies. He gave offense to the king for his support of the repeal principle and for refusal of allowances to the king's brothers, and was superseded by Pitt who returned to form a new ministry. His tenure lasted barely a year and his parliamentary career was inconspicuous until March 1782 when upon the fall of North's administration he was called upon to form a coalition ministry in which he held the treasury. The chief

events of his second term were the concession of legislative independence to Ireland, and the forcing the king to treat for peace with the United States on the basis of their independence. In accomplishing these ends credit is not given to Rockingham for enlightened statesmanship but rather for the adoption of a policy of opportunism. Consult Albemarle, 'Memoirs of Rockingham' (1852-3).

**Rockland**, Maine, city, and county-seat of Knox County. Set off from Thomaston in 1848, and incorporated a city in 1854. On a harbor which is an easterly extension of Penobscot Bay at its mouth; is very commodious and easily accessible; is naturally protected from storms coming from any direction except from the northeast and against these by a breakwater a little more than four-fifths of a mile long extending from the northern shore, and is marked by two lights, a revolving one at the extremity of the breakwater and a fixed one at Owl's Head, the promontory in which its southerly shore ends. The breakwater was begun by the U. S. Government in 1881, and practically completed in 1902. It cost about \$500,000. Rockland is connected with Maine Central R. R. system; 86 miles by rail from Portland; has steamboat connection with Boston, Bangor and Portland, and with all the important coast and island towns of eastern Maine as far east as Machias, a steamer running every day to and from Bar Harbor during most of the year. It is the centre and managing point of the Rockland, Thomaston & Camden Street Railway system, which has 21 miles of track extending northward to Rockport and Camden, and westward to Thomaston and Warren, and other electric railways. The region thus connected accommodates many summer tourists and visitors. Many wealthy people have built summer cottages at Camden, which place is especially notable for its combination of coast and mountain scenery. Within its limits are several mountain peaks varying in height from 1,000 to 1,500 feet. Mt. Battie is close to Camden Village and very near the shore, and Mt. Megunticook, a loftier peak, extends along the shore further north. Along the inner side of these two mountains a road has been cut, which extends along the shore of a large lake, and affords some grand and beautiful scenery. The lake furnishes water power for extensive manufactories, the water being used five times in the descent of little more than two miles from the lake to where it flows into the salt water at Camden Harbor. Norumbega, a fine stone house built by the late J. B. Stearns, the inventor of the duplex telegraph, is one of the handsomest private residences ever constructed in Maine.

**Industries**—Shipbuilding has been for many years an important industry in this section, and fine vessels are constructed at Thomaston, Rockland, Rockport and Camden. A large part of the accumulated wealth has been derived from the building and operation of vessels. The Red Jacket, a clipper ship built at Rockland in 1855, is said to have made the passage across the Atlantic Ocean in a shorter time than it was ever made by any other sailing vessel. The principal industry of Rockland from a period that goes well back toward its settlement has

seen the manufacture of lime. This is also carried on at Rockport and Thomaston. The Rockland limestone has a higher percentage of calcium than any other considerable deposit in the country, and is reputed in the building market to make the strongest mortar. The quality and quantity have been materially improved by the introduction of patent kilns, in 1850, and the more recent introduction of coal as fuel. In 1890 a steam railroad was constructed to transport the stone from the quarries in the rear of the town to the kilns on the water front. Formerly in the hands of independent operators, the industry passed over to the Rockland-Rockport Lime Co., which now controls the railroad and about three-fourths of the product. The company also operates a large factory for the manufacture of hydrated lime. The shipments to New York and other points are largely made in barges towed by tugs. The granite business is important. Two of the largest granite companies of the country have quarries in the vicinity, on the islands and on the mainland. These companies have handled some of the largest stones that have ever been wrought. The United States custom house in St. Louis, the postoffices in New York and Cincinnati, and many of the largest and handsomest buildings in the country have been built of Rockland granite. Steam and gasoline engines and blacksmiths' and granite workers' tools are manufactured. Fishing is carried on to some extent. Clams and sardines are canned, and more than 2,000,000 pounds of lobsters are shipped annually from here by rail. It is an important distributing point to the towns of eastern Maine.

The public buildings are the U. S. custom house and postoffice building, which is a handsome granite structure and cost about \$150,000, and the County court house and jail, which are of brick with granite trimmings and are on the same lot. The two cost something more than \$100,000. There are many handsome residences with fine grounds. In one of the cemeteries is a statue of white Italian marble of General Hiram G. Berry, who was a citizen of Rockland, and was killed at the Battle of Chancellorsville. It is the work of Franklin Simmons. Pop. (1910) 8,174.

LEWIS FREDERICK STARRETT.

**Rockland, Mass.,** town in Plymouth County; on the New York, New Haven and Hartford railway; about 17 miles south by east of Boston. Until its incorporation as a separate town in 1874, it was a part of the town of Abington of the old Plymouth Colony. The town is pleasantly situated and its proximity to Boston and the convenience of transportation, give it an excellent trade and have made it a popular suburb of that city.

Rockland is a manufacturing place of growing importance. The census of 1900 returned 81 establishments with a combined capital of \$998,824, employing 1,071 persons at \$515,974 in annual wages. They used \$1,363,959 in materials and had a product valued at \$2,288,972. The industry first in importance was the manufacture of boots and shoes. Tacks are also extensively manufactured; and other factories

produce heels and shoe-soles, box board, shoe boxes, and soaps.

Rockland has well-built factory and public buildings, churches, schools, and attractive homes. It has two banks, a public library, and weekly newspapers. Pop. (1890) 5,213; (1900) 8,150; (1910) 6,928.

**Rockland, N. Y.,** a county in the southeastern part, bordering on New Jersey, and bounded on the east by the broadened expanse of the Hudson River known as the Tappan Zee and Haverstraw Bay. Nyack (q.v.), its largest town, is about 30 miles from New York, and in the vicinity, which is near the northern end of the Palisades of the Hudson and rugged and picturesque, are many handsome estates of New York business men. The county-seat is New City. The county is served by the New York, L. E. & W., the New Jersey & N. Y., and the West Shore R.R.'s; and while in many parts the soil is rocky, has, particularly in the eastern part, rich farms and large dairy interests. In the western section are the Ramapo Mountains, which contain the sources of the Ramapo and Hackensack Rivers. Granite, gneiss, limestone, trap, and red sandstone are extensively quarried, the last a good building-stone; the brick manufacturing is important; and large quantities of fruit, green vegetables, butter, and milk are shipped daily to New York. Many of the farmers "take boarders" during the summer months, and its healthfulness and its proximity to the city make Rockland County a popular vacation resort.

**Rockland Lake, N. Y.,** a village of Rockland County, on the West Shore Railway, and on the Hudson River; four miles above Nyack and 30 miles above New York. It has only a small permanent population but is a popular vacation resort. Near here is Rockland Lake, a large sheet of clear, fresh water, from which 300,000 tons of ice are taken annually for use in New York.

**Rockling,** a European fish of the cod family and of the genus *Motella*, three species of which are regarded as valuable in British markets.

**Rockport, rôk'pôrt, Ind.,** city, county-seat of Spencer County; on the Ohio River, and on the Louisville, E. & St. L. railroad; about 100 miles southwest of Louisville, Ky., and 30 miles in direct line east by south of Evansville. It has steamer connections with all the river ports. It is on a bluff about 100 feet above high water. It is in an agricultural region in which grain and tobacco are the chief productions. The city has considerable manufacturing interests; the principal industrial establishments are flour and grist mills, foundry, machine shops, tobacco stemmeries, brick works, basket factories, creamery, wagon and carriage works, and furniture factories. It has a library founded in 1855. Pop. (1890) 2,314; (1900) 2,882; (1910) 2,736.

**Rockport, Mass.,** town in Essex County; on the Atlantic Ocean, and on the Boston & M. railroad; about 30 miles northeast of Boston.

## ROCKPORT AND ROCKS

It is on an island, the same on which Gloucester (q.v.) is located. The town embraces several villages. Electric lines connect Rockport and Gloucester and many points on the island. It was settled in 1690 by Richard Tarr and was known at first by the name "Sandy Bay." It is a famous summer resort; near Pigeon Cove, one of the villages, are a number of summer cottages. Part of the land is fertile and is used mainly for market gardening. Some of the places of interest in the vicinity are Dogtown Commons, where in the last of the 18th century a hundred families exiled themselves and lived in loneliness and poverty on those boulder strewn hills. Their numerous dogs gave the place its name. Other places of interest are Doctor's Run, The Headlands, and the Straitsmouth Life Saving Station at Gap Cove. In the northeastern part of the town are extensive granite quarries. The Boston post-office is built of granite obtained from these quarries. The chief manufacturing establishment is an isinglass factory which employs about 1,000 persons. There is one national and one savings bank. There are 12 churches, and the educational institutions are a high school, grammar and primary schools, and a public library, opened in 1871. Pop. (1910) 4,211.

G. M. HASKINS.

Rockport, Texas, town, county-seat of Aransas County; on the Aransas Bay, an inlet of the Gulf of Mexico, and on the San Antonio & A. P. railroad; about 170 miles southwest of Galveston, and 135 miles south by east of San Antonio. It was settled in 1865 by Doughty and Mathis; was incorporated in 1865 and chartered as a city in 1871. It has steamer connections with all of the Gulf ports. It is on the peninsula, Live Oak Point; and the cool gulf breezes make it a popular summer resort. It has extensive fishing interests, especially oysters, and small game is plentiful in the vicinity. Rockport makes large shipments of hides, livestock, and fruit. There are five churches, a high school, elementary schools, and one national bank. The government is vested in a mayor and a board of aldermen, eight in number, who are elected biennially. Pop. (1900) 1,155; (1910) 1,277.

C. W. NEWMAN,  
Editor 'Enterprise.'

**Rocks.** Regarded as a whole, the earth, so far as we can examine it first hand and thus know it intimately, consists of three envelopes: (1) an outer gaseous envelope called the atmosphere; (2) a middle aqueous envelope called the hydrosphere; (3) an inner solid envelope called the lithosphere. These envelopes, considered together, including the lithosphere to a depth of 10 miles below the sea-level, have been shown to consist quantitatively of the following elementary substances:

|          |        |             |       |          |       |
|----------|--------|-------------|-------|----------|-------|
| O .....  | 49.98% | Na .....    | 2.80% | P .....  | 0.09% |
| Si ..... | 25.30% | K .....     | 2.25% | Mn ..... | 0.07% |
| Al ..... | 7.26%  | H .....     | 0.94% | S .....  | 0.04% |
| Fe ..... | 5.08%  | Ti .....    | 0.30% | Ba ..... | 0.03% |
| Ca ..... | 3.31%  | C .....     | 0.21% | N .....  | 0.02% |
| Mg ..... | 2.50%  | Cl:Br ..... | 0.15% | Cr ..... | 0.01% |

These 18 substances have been shown by F. W. Clarke (Bulletin 76 United States Geological Survey, pp. 34-43) to comprise the great bulk of the earth. The others, though outnumbering them three to one, can be ignored.

The above-named elements, so far as they enter into the composition of the lithosphere, rarely occur in the uncombined state, but are usually united chemically in different proportions to form those more or less definite chemical compounds called minerals (for example, quartz,  $\text{SiO}_2$ ; calcite,  $\text{CaO} \cdot \text{CO}_2$ ; olivine,  $(\text{MgFe})_2\text{SiO}_4$ ); and minerals in turn are aggregated in various ways to form rocks. A rock may be defined as any accumulation or aggregation of one or more mineral species or substances, potential or actual, which constitutes a considerable component of the lithosphere; for example, granite, sandstone, limestone, clay, gravel, salt-beds. Although the crust of the earth or lithosphere has been shown to contain many hundreds of species of minerals, nevertheless the great bulk of it is composed of comparatively few species, and these have been termed the rock-forming minerals, in contradistinction to the great multitude of mineral species found more particularly in veins, and which, though of great importance economically, and of primary interest scientifically, are insignificant in amount when compared with the great mass of the more common minerals which go to make up a large portion of the earth. Thus gold, silver, platinum, the sulphide ores, and the minerals containing such rare substances as thorium, uranium, or radium, are negligible in quantity when compared with the mass of minerals composing the lithosphere.

The science or treatise of rocks, in its broadest scope, which considers them in all their relations, is called petrology or lithology, while the systematic and descriptive science of rocks, leading more particularly to their nomenclature, is called petrography. This distinction is implied in the etymology of the words. The latter term is used commonly in connection with the microscopic study of the igneous rocks.

Those minerals which are of especial importance as rock-formers can be grouped as follows:

### GROUP I.

**Quartz.**—This group, for present purposes, may be limited to a single species, quartz, which is one of the most abundant of minerals, and is remarkable otherwise for its rather superior hardness, lack of cleavage, and indestructibility. It has strong crystallizing powers and, where allowed to grow intact, forms those beautiful hexagonal crystals with which all are familiar. Chemically it is an oxide of silicon,  $\text{SiO}_2$ , that most abundant of all acid radicals, which, when combined with the bases alumina, lime, iron, magnesia, and the alkalis, soda and potash, in different ways, forms that most important of all classes of mineral substances, the silicates.

### GROUP II.

**Feldspars.**—These are the most abundant of all rock-formers. They comprise a rather complex group of silicates, where alumina, the alkalis, potash and soda, and the alkaline earth-lime, are the bases. On a chemical and crystallographic basis they fall naturally into two series, the orthoclase and the plagioclase. Orthoclase, so called because of the rectangular cleavages lying parallel to the ortho- and clinopinacoids, is the type-species of the series. It is a silicate of potash and alumina having the chemical composition  $\text{KAlSi}_3\text{O}_8$ , and is otherwise

## ROCKS

known as potash feldspar. It belongs to the monoclinic system of crystallization, and is further known as the monoclinic feldspar. A part of the potash of orthoclase may be replaced by soda. In fact most of the analyses of the mineral show one per cent or more of the substance. This replacement of potash by soda can take place until these two constituents are present in nearly equal proportions without altering the monoclinic character of the species. Such an orthoclase is called soda-orthoclase. Soda-orthoclase has a chemical composition represented by the formula  $(\text{Na,K})\text{AlSi}_3\text{O}_8$ , where soda predominates over potash. Under the microscope and between crossed nicols it exhibits a peculiar patchy appearance easily recognized.

Microcline, like soda-orthoclase, contains both potash and soda,  $(\text{K,Na})\text{AlSi}_3\text{O}_8$ . It is, however, triclinic, but only slightly so, as the cleavage angle between the pinacoids varies but slightly from  $90^\circ$  ( $89^\circ 30'$ ), hence the name. Between crossed nicols it exhibits a peculiar cross-hatching, due to multiple twinning according to both the pericline and albite laws, and is thus usually easily distinguished under the microscope. It stands at the head of the true plagioclase series, but inasmuch as it possesses a notable amount of potash, it may be classified with soda-orthoclase as representing the transition varieties of feldspar, lying between the monoclinic, potash, orthoclase series and the triclinic, soda-lime, plagioclase series.

The more typical plagioclases are represented by albite, oligoclase, andesine, labradorite, bytownite, and anorthite, which together constitute the albite-anorthite series. The theory of their constitution was propounded by Tschermak in 1864. He showed that the series can best be explained as a mixture of two extreme molecules, the one a pure soda-alumina silicate molecule, and the other a lime-alumina silicate molecule, found in anorthite. The intermediate varieties can be considered as varying mixtures of these two molecules. Representing the albite molecule by Ab and the anorthite molecule by An, the series is expressed thus:

|             |  |
|-------------|--|
| Albite      | Ab ( $\text{NaAlSi}_3\text{O}_8$ )                               |
| Oligoclase  | $\text{Ab}_{90}\text{An}_{10}$ to $\text{Ab}_{70}\text{An}_{30}$ |
| Andesine    | $\text{Ab}_{60}\text{An}_{40}$ to $\text{Ab}_{40}\text{An}_{60}$ |
| Labradorite | $\text{Ab}_{30}\text{An}_{70}$ to $\text{Ab}_{10}\text{An}_{90}$ |
| Bytownite   | $\text{Ab}_{10}\text{An}_{90}$ to $\text{Ab}_{0}\text{An}_{100}$ |
| Anorthite   | An ( $\text{CaAl}_2\text{Si}_2\text{O}_8$ )                      |

This series of mineral varieties furnishes one of the best illustrations of an isomorphous mixture. It constitutes the albite-anorthite or soda-lime series of plagioclase feldspars, all of which are distinctly triclinic. The cleavage angle in this series varies from  $93^\circ 31'$  in labradorite to  $94^\circ 5'$  in albite.

Usually the plagioclase feldspars can be quickly and surely distinguished from the microcline or the orthoclase varieties by their characteristic multiple twinning, which is manifested in thin sections between crossed nicols by a distinct parallel banding that traverses the individual mineral plates. It thus becomes a comparatively simple matter, with thin sections under the microscope and between crossed nicols, to distinguish between orthoclase, which normally shows plain non-striated plates, soda-orthoclase, which has a peculiar patchy appear-

ance, microcline with its more or less indistinct cross-hatching, and plagioclase with its characteristic, sharply defined, parallel banding. Furthermore, the different varieties of the plagioclase series can be identified by their behavior in polarized light, more particularly by the variation in their extinction angles. In a general way this angle may be said to increase in size in passing from the albite toward the anorthite end of the series.

The feldspars are not only of primary importance as rock-formers, but the classification of rocks as at present accepted (more particularly the igneous varieties) depends largely upon the kind of feldspar which they contain.

The feldspars can be grouped in tabular form thus:

| (a) Monoclinic        |  | Cleavage angle |
|-----------------------|--|----------------|
| Orthoclase (sanidine) | $\text{KAlSi}_3\text{O}_8$                       | $90^\circ$     |
| Soda-orthoclase       | $(\text{Na,K})\text{AlSi}_3\text{O}_8$           | $90^\circ (?)$ |
| (b) Triclinic         |  |                |
| Microcline            | $(\text{K,Na})\text{AlSi}_3\text{O}_8$           | $90^\circ 30'$ |
| Soda-microcline       | $(\text{Na,K})\text{AlSi}_3\text{O}_8$           | $90^\circ 30'$ |
| Albite                | $\text{NaAlSi}_3\text{O}_8 = \text{Ab}$          | $94^\circ$     |
| Oligoclase            |  | $93^\circ 4'$  |
| Andesine              |  | $93^\circ 23'$ |
| Labradorite           |  | $93^\circ 31'$ |
| Bytownite             |  |                |
| Anorthite             | $\text{CaAl}_2\text{Si}_2\text{O}_8 = \text{An}$ | $98^\circ 13'$ |

Crystallizing as they do in two systems, the feldspars are said to be dimorphous; and the group may be described as consisting of a series of isodimorphous mixtures of the orthoclase albite and anorthite molecules.

Frequent parallel intergrowths of two varieties of feldspar occur; for example, albite may be intergrown with microcline or orthoclase, where the albite shows as narrow irregular bands of a different-colored mineral matter running across the cleavage surfaces of the orthoclase or microcline. Such intergrowths are called perthitic intergrowths or perthite because certain flesh-red feldspars from Perth, Canada, were first shown to be made up of such intergrowths. These intergrowths are sometimes so minute as only to be made out with the microscope, and then they are called micro-perthite. Brögger has suggested that certain soda-orthoclases are intergrowths of this kind in which the albite lamellae are so narrow as not to be discoverable even with the highest powers of the microscope. For these supposed intergrowths he proposes the name cryptoperthite.

Similar parallel intergrowths of distinct mineral species may occur where quartz is intergrown with microcline. Such intergrowths of quartz and feldspar (usually orthoclase or microcline) are common in certain granite-like rocks called pegmatite, and are known as pegmatitic intergrowths, or graphic granite, referring to the resemblance of the curious V-shaped areas of quartz to cuneiform writing.

### GROUP III.

**Feldspathoids.**—The minerals of this group are called feldspathoids or feldspar-like minerals, more particularly because of their chemical resemblance to the feldspars. There are but two species which need be considered here: leucite, which has a chemical composition expressed by the formula  $\text{KAl}(\text{SiO}_3)_2$ ; and ne-

## ROCK FORMATIONS

---

- FIG. 1** Micro-photograph of thin section of granite, from Løkken, Norway, between crossed nichols, showing patchy appearance of soda-orthoclase (O), irregular plates of quartz (Q), and illustrating granitoid (xenomorphic or allotrimorphic) texture. The orthoclase shows twinning.
- FIG. 2** Micro photograph of thin section of auge syenite from Laurvik, Norway, between crossed nichols. The photograph shows only plain non-striated orthoclase and illustrates granitoid allotrimorphic or xenomorphic texture. The lines due to cleavage.
- FIG. 3** Micro-photograph of thin section of norite, from Hitteroe, Norway, between crossed nichols, showing banded plagioclase Labradorite (Pl), an opaque ore, ilmenite (I), and a monoclinic pyroxene diaspase (D). The section also illustrates granitoid (xenomorphic or allotrimorphic) texture. A fringe of biotite surrounds part of the ore.
- FIG. 4** Micro photograph of thin section of Perthite, between crossed nichols, showing intergrowth of albite (Ab) and microcline (Mc). The albite shows banding and the microcline cross-hatching.
- FIG. 5** Micro-photograph of thin section of grapha granite from New Bedford, Mass., between crossed nichols, showing parallel intergrowth of quartz (Q) and microcline (Mc). The latter shows cross-hatching.
- FIG. 6** Micro-photograph of thin section of porphyritic perthite showing sanidine crystals (S) in glassy ground mass. Dark wavy bands indicate flow in the mass before cooling (flow structure).
- FIG. 7** Thin section of porphyritic trachite showing sanidine (S) and biotite (B) in glassy ground mass. The crystals have been corroded or re-dissolved by the magma as is shown by their even, curved boundaries.
- FIG. 8** Micro-photograph of thin section of triguarte porphyry from the Glenwald showing xenomorphic crystals of nepheline (N), also an irregular 'zonal' structure in the same.
- FIG. 9** Micro photograph of thin section of auge norite, from Risør, Norway, showing long lath shaped crystals of plagioclase (Pl), auge with characteristic nearly rectangular cleavage (A), which is altered on the margins to serpentine (Ol), and an opaque ore (M).
- FIG. 10** Micro photograph of thin section of basalt between crossed nichols, showing of micro structure. It contains plagioclase (Pl), auge (A), and magnetite (M).
- FIG. 11** Micro photograph of thin section of Essexite from Gran, Norway, showing hypidomorphic auge crystals (A), and opaque grains of magnetite (M) in a fine ground mass of plagioclase. It illustrates hypidomorphic porphyritic texture.
- FIG. 12** Porphyritic basalt (metaphyre) with phenocrysts of plagioclase (Pl) in a dark micro crystalline ground mass consisting of auge, magnetite and a second generation of plagioclase crystals.

ROCKS.

## ROCKS

phelite, having the composition  $K_2NaAl_3Si_4O_{14}$ . Chemically leucite resembles orthoclase feldspar. In addition to being chemically like orthoclase, leucite, like its counterpart, alters to kaolin. But more interesting still is the fact that on decomposition it has been known to furnish orthoclase or orthoclase and muscovite.

Nephelite, as its chemical composition indicates, is analogous to the plagioclase feldspars. It is hexagonal in character. The decomposition of nephelite, like that of the plagioclases, usually results in the formation of some one of the zeolites, or more rarely it forms kaolin.

### GROUP VI

**Mica.**—Two species here are of widespread occurrence; one is muscovite, the white, silvery, potash variety, having a chemical composition corresponding to  $H_2KAl_3(Si_3O_{10})_2$ . Chemically it is closely allied to orthoclase, and frequently results as an alteration product of that mineral. Optically it is distinctly biaxial. The second species, biotite, is dark-colored, owing to comparatively high percentages of iron. It also contains varying amounts of magnesia, and might thus be properly classed with the following group of minerals. It is very nearly uniaxial. It has the chemical composition  $(HK)_2(MgFe)_2(AlFe)_2(Si_3O_{10})_2$ .

### GROUP V

**The Ferromagnesian Minerals.**—The minerals of this group take their name from the fact that they contain iron and magnesia as two of their prominent constituents. In addition they may contain lime and alumina in considerable amounts, also some alkali. The more important members of the group are included under the amphiboles and the pyroxenes, two species having numerous varieties, which pass into each other by isomorphous mixture. They form two parallel series which are both chemically and crystallographically analogous. Their relationship can best be shown by the following table:

|                  |                                  |
|------------------|----------------------------------|
| <b>Amphibole</b> |                                  |
| (a) Orthorhombic |                                  |
| Anthophyllite    | $MgSiO_3$                        |
| (b) Monoclinic   |                                  |
| Tremolite        | $CaMg_3(Si_3O_{10})_2$           |
| Actinolite       | $Ca(MgFe)_2(Si_3O_{10})_2$       |
| Hornblende       | $\{Ca(MgFe)_2(Si_3O_{10})_2$     |
| Glaucofane       | $\{CaMg_2Al_2(Si_3O_{10})_2$     |
| (c) Triclinic    | $NaAl(Si_3O_{10})_2MgSiO_3$      |
| Xenigmatite      | $Na_4Fe_3AlFe(Si,Ti)_{10}O_{38}$ |
| <b>Pyroxene</b>  |                                  |
| (a) Orthorhombic |                                  |
| Enstatite        | $MgSiO_3$                        |
| Hypersthene      | $(Mg,Fe)SiO_3$                   |
| (b) Monoclinic   |                                  |
| Diopside         | $MgCa(Si_2O_6)_2$                |
| Augite           | $\{CaMg(Si_2O_6)_2$              |
| Acmite           | $\{MgAl(Si_2O_6)_2$              |
| (c) Triclinic    | $NaFe(Si_2O_6)_2$                |
| Rhodonite        | $MnSiO_3$                        |

The really important rock-forming amphiboles and pyroxenes are to be found among the orthorhombic and monoclinic varieties. And it is necessary to distinguish here between those which are aluminous and those which are non-aluminous, for the special reason that the former on alteration produce chlorite, while the latter produce serpentine.

One other important rock-former must be mentioned as belonging to this group—olivine,

so called on account of its usual olive-green color. It has the chemical composition  $(Mg,Fe)_2SiO_4$ , is orthorhombic in crystallization, and readily decomposes to serpentine.

### GROUP VI

**Ores.**—Minerals of this group have iron as their principal constituent, and frequently constitute ores of that substance. Included here are:

|           |             |
|-----------|-------------|
| Magnetite | $FeFe_2O_4$ |
| Pyrite    | $FeS_2$     |
| Hematite  | $Fe_2O_3$   |
| Ilmenite  | $FeTiO_3$   |
| Chromite  | $FeCrO_4$   |

Thus far the mineral species enumerated are mostly found as the essential constituents of that class of rocks hereafter to be described as igneous.

### GROUP VII

**Accessory Minerals.**—Those minerals which are usually of subordinate importance, and which are therefore more in the nature of accessory than notable rock-constituents, are included here:

|             |                       |
|-------------|-----------------------|
| Cassiterite |                       |
| Rutile      |                       |
| Titanite    |                       |
| Apatite     |                       |
| Monazite    |                       |
| Corundum    |                       |
| Spinel      |                       |
| Garnet      | $\{ \text{Almandite}$ |
|             | $\{ \text{Grossular}$ |
| Staurolite  |                       |
| Chastolite  |                       |
| Kyanite     |                       |
| Fibrolite   |                       |
| Cordierite  |                       |
| Tourmaline  |                       |
| Topaz       |                       |
| Fluorite    |                       |
| Zircon      |                       |
| Alkanite    |                       |
| Zoisite     |                       |

Some of the above minerals occasionally come to be of considerable importance, or may even constitute the bulk of the rock-mass. As a rule, however, they are of minor consideration and frequently even negligible.

### GROUP VIII

**Secondary Minerals.**—Minerals of this class have originated as the result of the decomposition or alteration of some previously existing primary or original mineral. The most noteworthy are:

|            |                              |
|------------|------------------------------|
| Kaolin     | $H_4Al_2Si_2O_9$             |
| Serpentine | $H_2Mg_3Si_2O_{10}$          |
| Talc       | $H_2Mg_3(Si_2O_5)_2$         |
| Chlorite   | $H_2(Mg,Fe)_3Al_2Si_2O_{10}$ |
| Epidote    | $\{Ca_2Al_2(AlOH)(SiO_3)_2$  |
|            | $\{Ca_2Fe_2(FeOH)(SiO_3)_2$  |

Kaolin results from the decomposition of orthoclase and other feldspars by the loss of some of the silica and alkalis, and by the addition of water (hydration). Serpentine results from the alteration of olivine and the non-aluminous hornblendes and pyroxenes by the loss of some of the magnesia and by an addition of water. Talc is formed by the hydration and partial decomposition of several of the lime-magnesia or non-aluminous ferromagnesian minerals, namely, tremolite, pyroxene (chiefly enstatite), phlogopite mica. Chlorite results most

## ROCKS

frequently from the alteration of the aluminous hornblendes and pyroxenes. Epidote also results from the alteration of the aluminous varieties of hornblende and pyroxene, especially those having some lime in their composition.

### GROUP IX.

*Precipitations from Aqueous Solutions.*—The following minerals occasionally form im-  
 hypotheses are at present recognized as possible  
 from solution in water:

|                                 |   |
|---------------------------------|---|
| Salt                            | NaCl                                      |
| Gypsum                          | $\text{CaSO}_4 \cdot 2\text{H}_2\text{O}$ |
| Aragonite or Calcite            | $\text{CaCO}_3$                           |
| Hydrous Silica                  | $\text{SiO}_2 \cdot n\text{H}_2\text{O}$  |
| (Geyserite or Siliceous Sinter) |   |

*Origin of Rocks.*—Two alternative hypotheses are at present recognized as possible explanations of the origin of the earth: (1) the old so-called nebular hypothesis, propounded by Kant and Swedenborg and later elaborated by Laplace and others; (2) the newly proposed accretion theory or planetesimal hypothesis propounded by Professor Thomas C. Chamberlin of the University of Chicago. The first of these supposes that the earth was originally in a gaseous condition, from which, under its own gravity and by a radiation of its heat, it passed into a fluid state and thence to a solid form. The "original crust" of the earth (lithosphere) formed at the surface as the result of a cooling of the molten materials of the globe. Furthermore, the earth may have solidified from the centre outward as the result of pressure. Others suppose that the original crust was not only added to from below by the crystallization of molten material, but also increased in thickness from above by chemical precipitations from the intensely heated hydrosphere. The accretion theory, on the other hand, supposes that the earth as a whole never was in a gaseous or even fluid condition, but was built up by the infalling of cold, solid, discrete particles of matter called planetesimals; that the present internal heat is the result of pressure due to gravity. Adherents of both these hypotheses agree, however, that the oldest known rocks, the original or primitive rocks from which all others have been derived, are of igneous origin, that is, were once in a molten condition, from which they cooled to the solid state, and in so doing formed more or less thoroughly crystalline aggregates of different kinds of minerals.

In discussing the origin and descent of rocks we must therefore start with the more common igneous varieties, and show how they have furnished materials for the others.

*Rock Disintegration.*—Granite is one of the most abundant and widespread of igneous rocks, and is a most important species among the numerous other primitive rocks of the lithosphere. The changes which take place in it in the process of its decay can be taken as illustrative of those which take place in the disintegration of all other primitive rocks. Granite consists of quartz, orthoclase feldspar (with some soda-orthoclase microcline or plagioclase), and light or dark mica, or both, or perhaps hornblende in place of the micas.

On decomposition under the influence of atmospheric agencies, it falls to a more or less rusty, clayey mass of sandy or gravelly material,

the sandy or gravelly part consisting of angular fragments of the original quartz (which is practically unaffected by atmospheric agencies), and fragments of still undecomposed feldspars. The clayey portion of the alteration products results from the decomposition of the feldspar and consists largely of kaolin, which in a pure condition is a white powdery or plastic material, according to whether it is dry or wet. It is usually stained rusty brown by iron oxide, which results from the decomposition of any ferromagnesian constituent contained in the rock, or from small particles of some one of the ores which are quite certain to have been present in small amounts. Certain constituents of the original minerals are carried off in solution: the alkalis and a part of the silica in the feldspars; also a portion of the iron of the ferromagnesian minerals, together with some of the magnesia and much of the lime that may have been present as a minor constituent.

This mass of loose, more or less rusty, incoherent material remaining behind is termed residual granite. Rocks of whatever nature are in like manner subject to decomposition by atmospheric agencies, and their residual materials everywhere cover the greater portion of the surface of the underlying rocks, and constitute what is termed mantle-rock or detritus. A part of this mantle-rock consists not of residual material in the strict sense, but is made up of angular fragments of various sizes, which have been broken from the rock-masses by the action of frost. At the foot of nearly every steep cliff is to be found an accumulation of angular rock-fragments called talus, rock-slide, or breccia.

*Removal of Rock-waste and Its Deposition in the Form of Sediments.*—Most of the various materials of the mantle-rock, whether residual or fragmental, find their way sooner or later, chiefly by the action of rain or frost, to the neighboring streams, and are borne by them to the rivers, which in turn transport them, after numerous halting-periods, to the sea or to smaller bodies of salt or fresh water. In this process of transportation the angular rock-fragments are reduced by attrition to rounded pebbles. The angular grains of quartz also become rounded and water-worn, while much of the material becomes reduced to an impalpable mud. These more or less finely comminuted and abraded materials are distributed along the shores of lake or sea. Gradually the finer, more easily suspended and transportable materials are carried out into deep water, the finest and most impalpable muds being transported farthest from the shore; so that, broadly speaking, the washings from the land surface become distributed over sea and lake bottom in order of fineness, beginning with the coarsest gravelly materials at the shore-line, and growing successively finer toward the deep water, where finally only the impalpable silts and muds are deposited.

*Stratification.*—In addition to this more or less gradual horizontal change from coarse to fine materials brought about by the transporting power of water, there is always to be observed a much more sudden and abrupt change vertically, by which materials of various sorts and degrees of fineness are arranged by the sorting power of the same medium (water) into horizontal beds of varying thickness, which are separated from each other by sharply defined planes of demar-

cation called sedimentation or bedding planes. Beds which consist of the same material mineralogically are called strata. But a stratum may be made up of thinner beds, owing to a difference in the fineness of the material which composes it. These subdivisions of a stratum are called layers, and layers in their turn may be composed of extremely thin beds, only the very small fraction of an inch in thickness, called laminae. Strata vary in thickness from a few inches to several feet. All materials deposited in water are called sediments; and all sediments were originally deposited in nearly horizontal position. These nearly horizontal strata slope or dip slightly toward deep water, and this slight inclination is known as initial dip. All materials deposited in water are stratified, and this is the chief characteristic of all rocks so formed. The converse statement of this is that all stratified rocks are of aqueous origin. Rocks of this character are called sedimentary.

**Consolidation of Sediments into Coherent Rock-masses.**—Sediments have accumulated to a very great thickness during geologic time. Those sediments which have been deeply buried and have been subjected to great pressure have been made to cohere either as a direct result of this pressure or by a cementing together of the particles by mineral substances in solution; namely, silica, carbonate of lime, carbonate of iron precipitated as the oxide.

**The Metamorphism of Sediments.**—Those most ancient of all sediments which were derived from the disintegration of the original or primal rocks of the lithosphere, and which were first deposited in the primordial seas, have been so deeply buried in the crust of the earth as to have been affected by the uprising heat of the earth's interior. This heat, united with the tremendous pressure exerted by the superincumbent mass of sediments and the dissolving effect of the intensely (super-) heated moisture present, reduced the sediments to a partly fused, partly dissolved, more or less pasty condition (aqueo-igneous fusion), from which they subsequently cooled, thereby changing into thoroughly crystalline masses, consisting of distinct mineral aggregates more or less resembling the crystalline rocks of the igneous type, but different from the latter chiefly in this, that the original stratification (bedding) planes are still visible. Such rocks are utterly changed in everything except their chemical composition from their original condition and appearance, and are said to be metamorphosed. As a class they compose the metamorphic rocks. It is not alone these ancient sediments which have suffered transformation. Sediments of every geologic age have been found in some quarter of the globe in the metamorphosed condition.

**General Classification of Rocks.**—All rocks can be classified according to their origin as follows: (1) igneous; (2) aqueous; (3) æolian; (4) glacial; and (5) metamorphic.

**Igneous Rocks.**—(Definitions depending upon external form and mode of occurrence.) Igneous rocks comprise all those portions of the lithosphere which are or were in an intensely heated and more or less fluid condition and which have subsequently solidified by cooling into massive, more or less crystalline bodies of varying sizes and shapes. They occur as in-

trusions into or replacements of some previously existing rocks of the lithosphere, either sedimentary, metamorphic, or igneous. Where a huge mass of molten material slowly melts its way from some deep-seated portion of the earth up into the overlying rocks by dissolving them and incorporating them in its own mass, and subsequently cools there, slowly, without ever reaching the surface, forming a great irregular body of coarsely crystalline matter frequently scores of miles in extent, we have what is termed a batholith. In its molten condition it would be termed a magma and the reservoir in which it was contained would be called a magma basin. The period of its existence as a fluid mass is termed the intratelluric (within-the-earth) period. It might have extending from it (usually upward) irregular, more or less elongated, arm-like processes called apophyses. Should cracks or fissures form, they would be instantly filled by the influx of fluid substance, which would solidify with comparative rapidity to form dikes. In stratified rocks dikes usually cut at some angle across the strata. Where the molten material intrudes itself between the strata parallel to the bedding planes in broad sheets, it is called an intrusion-sheet or sill. Where the overlying strata become lifted and arched upward into a huge dome without breaking above and letting the fluid rock escape, the solidified lenticular mass constitutes a laccolith or laccolite. Where the molten rock actually escapes to the surface by means of a fissure or other conduit, and flows out over it in a broad sheet, it is termed a flow, lava-flow, or intrusion-sheet. The interval of time elapsing between the outbreak of the magma from its reservoir and its subsequent cooling to the solid state is termed the effusive period. If the conduit is rudely cylindrical the lava accumulates about the vent, forming a lava or volcanic cone. Subsequent erosion may entirely remove the cone and expose the cold lava in the conduit, to which the term volcanic neck is applied. In fact it is only through the exposure of these deep-seated masses of cooled igneous material by erosion that we are enabled to study them. Over the more ancient land areas many miles of rock, vertically measured, have been removed, laying bare the underlying rocks to a corresponding depth.

**The Modern Conception of Rock Magmas.**—The popularly accepted idea of lava is that it is rock which has been fused by great heat. In fact the older conception of scientific men was that magmas consisted of fused rock-masses. Recent opinion, however, based on the revelations of the microscope and experiments in the synthesis of minerals and rocks, tends to regard them as solutions of one mineral substance in another or of several mineral substances mutually in each other. One of the chief reasons for thinking them such can be stated as follows: If magmas are fusions then the individual mineral constituents potentially present in them should crystallize out according to their fusibilities, beginning with the least fusible, but they do not. On the other hand, as the magma slowly cools, the first individual mineral species makes its appearance when the point of saturation for that particular species is reached, and the others follow in the order of their solubilities. For example, in granite (which consists

of quartz, feldspar, and mica or hornblende, with some accessory constituent, such as apatite, or zircon, and, it may be, also a small amount of one or more of the ores), the order of crystallization is: (1) the ores with apatite and zircon; (2) mica or hornblende; (3) feldspar; (4) quartz. Quartz is the least fusible, and should appear first under the fusion theory. As a matter of fact it appears last. In short, all of the materials appear in the reverse order of what we would expect if they are true fusions. But they do appear in the order of their solubilities. Pressure, however, exerts an important influence upon the solvency of a substance, and as this is variable the order of appearance is not absolutely fixed. Moreover, heat, the most important factor involved, is very variable, and still farther modifies the problem.

*The Splitting or Cleavage of Magmas (Spaltung).—*When a magma cools, the first minerals to appear are the ores (with apatite, titanite, zircon, etc.); following these, the basic ferromagnesian constituents; then the more basic plagioclase feldspars, followed or overlapped by the orthoclase varieties; and last of all, quartz, if more than enough exists for the formation of the silicates. Obeying the principle of diffusion, the first minerals to form—the more basic ones—tend to accumulate on the cooling walls, that is, at the periphery of the magma-basin; and the other minerals arrange themselves rudely in concentric zones, each zone toward centre being successively more acid, until at the centre the magma becomes comparatively acid and may, after solidification, consist largely of such minerals as orthoclase and quartz. This arrangement of the minerals by diffusion before crystallization results in the rude separation of an originally uniform magma into several magmas of different chemical compositions, which, on cooling, furnish rocks of different mineralogical compositions. This process is termed the cleavage of magmas.

Definitions depending upon internal characteristics will next be considered.

*Texture.*—The fluid magmas of igneous rocks may be compared to molten glass. If the cooling period be long the individual minerals form comparatively large crystals. If it be short the crystals are correspondingly small. If it chills so suddenly that the molecules of the different mineral compounds do not have time to unite to form crystals, but are caught just as they existed originally in the fluid magma, the result is a volcanic glass. Rocks in which the crystals are 5 millimetres or more in diameter may be called coarse-grained; rocks in which the crystals range in size from 1 to 5 millimetres, medium-grained; and those in which they are 1 millimetre or less in diameter, fine-grained. Rocks in which all of the original magma has individualized or crystallized, to form minerals of some sort, and in which there is no unindividualized material remaining behind in the form of glass, are called holocrystalline. All rocks in which the crystals are large enough to be seen with the unaided eye are termed phanerocrystalline, or phaneric. Those rocks in which the crystals are too small to be distinguished megascopically are called aphanitic. Many aphanitic rocks, however, under the microscope are seen to be holocrystalline and to consist of small crystals of minerals which can be specifi-

cally identified with the aid of that instrument. For these rocks the term microcrystalline has been proposed. But the crystals, though recognizable, may be too small to be specifically identified even with the microscope. Such rocks are called microcryptocrystalline. Volcanic glasses show only embryonic crystals (microlites, trichites, crystallites) imbedded in textureless glass. Such rocks are said to be vitreous or glassy.

If during the entire period of solidification the conditions of cooling remained the same and the entire process of cooling of a deep-seated magma was slowly and quietly accomplished in the magma-basin, unattended by any effusive period, the rock would be coarse (to fine), evenly-granular. In rocks cooling under these circumstances the growing crystals have usually interfered with each other in such a way as to mutually destroy their crystal boundaries, forming irregular interlocking grains, with no one diameter much greater than the others. In other words, the grains are irregularly rounded. A texture of this sort is characteristic of the granites, and is called the granitic or granitoid texture. The term allotrimorphic, referring to the fact that the crystals do not possess their own boundaries, is applied to the same texture, and a still newer term, xenomorphic, has recently been proposed. Where the majority of the crystals do retain their crystal boundaries, the resulting texture is called idiomorphic or automorphic. If the crystal boundaries are only faintly or imperfectly discernible, the structure is said to be hypidiomorphic.

The period of intratelluric solidification may be interrupted by an effusive period; in which case those crystals which had begun to form, and may have reached considerable size, during the intratelluric interval, are carried by the eruption into other surroundings, where the cooling process may be much accelerated. A second generation of smaller crystals would then form about the large well-formed ones, imbedding them in a fine-grained or possibly aphanitic ground-mass, producing what is termed porphyritic texture. Two or more generations of crystals may thus be recognized. The well-defined crystals of the first generation are usually pronouncedly idiomorphic, and are called phenocrysts. The term felsite is applied to the aphanitic ground-mass of the acid rocks.

The crystals of some one mineral species in a rock may have one diameter much larger than the others. The crystals then appear distinctly lath-shaped in thin section under the microscope. This form of crystallization is especially common with the plagioclase feldspars. These laths of plagioclase are enclosed by crystals of another species. This texture is common, and in the scheme of classification of igneous rocks at present accepted is called into rather prominent requisition. It is known as the ophitic texture.

Flow-structure is exhibited by the parallel arrangement or orientation of minerals in lines which indicate the direction in which the fluid rock had been moving before solidification took place, or while it was in a viscous state.

*Classification of Igneous Rocks.*—The classification of igneous rocks as at present widely accepted is based upon three things: (1) chemical composition; (2) mineralogical composition; (3) texture. (The proposed 'Quantitative

**Classification of Igneous Rocks,** published jointly by Cross, Iddings, Pirsson, and Washington, University of Chicago Press, 1903, is the most logical and satisfactory attempt at a thoroughly scientific classification of the igneous rocks yet proposed, and bids fair to be epoch making.)

**Chemical Composition.**—The chemical composition of igneous rocks is primarily expressed in terms of silica percentage. Rocks which contain from 60 to 80 per cent of silica are called acid. Most of these rocks contain free quartz; those which range from 40 to 60 per cent in silica are called basic, and rarely possess free quartz in any considerable amount; while those which fall below 40 per cent are termed very basic. Generally speaking, as the silica percentage declines the percentage of the bases (lime, iron, magnesia) increases. This change in chemical composition from acid to very basic is indicated by change in color, the acid rocks being light ashy gray, while the very basic are dark.

**Mineralogical Composition.**—Quartz is more or less abundant in rocks of the acid division, but soon disappears in passing toward the basic end of the series. Orthoclase is the dominant feldspar among the acid rocks, but even here the plagioclases are more or less common. Among the basic rocks the plagioclases prevail, and in a general way change from the albite to the anorthite variety as the more basic rocks are approached, but fail entirely in most rocks of the very basic division.

The ferromagnesian minerals are subordinate, almost negligible, in the very acid rocks. They become dominant in the basic and constitute the bulk of the very basic rocks.

The ores, chiefly magnetite, chromite, and ilmenite, are found more or less sparsely disseminated through all three divisions, but they become notable constituents among the basic and very basic rocks, and may even segregate to form important bodies of ore.

**Texture.**—As already explained, magmas which solidify deep within the lithosphere usually form coarse (to fine) evenly-granular rock-masses, having the granitoid texture, although they may be more or less porphyritic or idiomorphic in character. These deep-seated rocks are called plutonic. Where eruption takes place those rocks which solidify somewhere between the magma-basin and the surface (as intrusion-sheets, dikes, laccolites, etc.) are called intrusive, while those which cool subaerially (or it may be beneath bodies of water) are called effusive or extrusive. While neither the plutonic, intrusive, nor extrusive members are limited to any one kind of texture, it is true that the plutonic rocks are more frequently granitoid, and the intrusive and extrusive members even-fine-grained, felsitic, aphanitic, or porphyritic in texture, while the textureless volcanic glasses are nearly always extrusive.

**Rock-families. I. Acid Division; Granites.**—The granites are plutonic rocks occurring frequently as huge irregular masses, which have slowly melted their way up from some deep-seated region into the more ancient and then deeply-buried portions of the lithosphere; or they may occur as apophyses or dikes given off from some parent mass. Mineralogically they consist of quartz, dominant feldspar of the orthoclase variety (with subordinate amounts of

soda-orthoclase, microcline, or oligoclase), and muscovite or biotite mica, or both. Typical granite has muscovite. Where biotite alone is present it is called granitite. Where hornblende or tourmaline replaces the mica, the rock is called hornblende- or tourmaline-granite. Where mica fails and the rock consists of quartz and orthoclase, it is termed aplite. Where feldspar fails and only quartz and mica remain, the rock is called greisen. Aplite and greisen are the most acid forms of the granites. As accessory constituents might be mentioned, zircon, allanite, cassiterite, rutile, titanite, magnetite. By a gradual decrease of quartz the granites pass imperceptibly into the syenites (to be described later), and by similar changes into the diorites.

There is a form of granite called pegmatite, which is found in veins or dikes. It is very coarsely granular. The crystals of feldspar sometimes measure a foot or more in diameter, while the quartz and muscovite crystals correspond in size. Pegmatite is the source of nearly all of the white mica of commerce. It is also remarkable as being the home of a variety of extremely rare minerals—compounds of thorium, lanthanum, yttrium, etc.—among which may be mentioned uraninite or pitch-blende, the present source of radium. Pegmatite is characterized by the interesting parallel intergrowth of feldspar and quartz, already referred to, called graphic granite. Pegmatite is particularly noteworthy, however, as having been deposited from an intensely heated aqueous solution, perhaps from vapor of water (mingled with other gases, such as carbonic acid, hydrofluoric acid, boracic acid, etc.), which was under such great pressure that it bordered on the fluid condition. The minerals of pegmatite, more particularly the quartz crystals, are frequently filled with fluid inclusions of water or carbonic acid. A great variety of minerals and a few rocks are considered to have been formed in this manner, and are said to be of pneumatolytic origin (Greek, *pneuma*, to turn into air), and such processes are termed pneumatolytic processes. Furthermore, since these processes usually succeed some great volcanic outbreak, they are termed post-volcanic processes.

The granites as a family have a range in silica which varies between 65 and 80 per cent.

Where a magma of the chemical composition of granite erupts, it may form dikes, sheets, or flows. The rocks may have a variety of colors, but they are prevalently light ashy gray. Where crystalline, they possess the same mineral constituents as granite, except that the feldspar is apt to be the glassy variety of orthoclase called sanidine. The porphyritic texture prevails among the intrusive and extrusive forms alike.

The geologically older intrusives of this family are called quartz or orthoclase porphyry according to whether the phenocrysts imbedded in the felsitic ground-mass are quartz or orthoclase. The strictly extrusive forms of granite are known as rhyolites (from the Greek word which means to flow), so called because of the flow-structure which is commonly developed in them. The rhyolites are rarely holocrystalline, containing nearly always more or less glass, and occasionally consisting wholly of it. These entirely glassy forms of rhyolite are called obsidian. Perlite and pitchstone are varieties of obsidian. Occasionally the rhyolites are frothy

in character, due to the rapid escape of steam resulting from the relief from great pressure. This form is known as pumice. Rhyolite is also called liparite because extruded abundantly from the volcanoes of the Lipari Islands.

**Syenite.**—The hornblende granites, as already explained, are those in which the mica has been replaced by hornblende. An occurrence of such a rock at Syene (now Assuan) on the Nile, was called syenite from its locality. Of late the term has been restricted to quartz-less rocks consisting primarily of orthoclase and hornblende. Rocks of the syenite family usually carry varying amounts of plagioclase, and may contain subordinate quartz. Apatite, zircon, titanite, and magnetite are uniformly present as accessory constituents. In texture they are granitoid and, by an increase of quartz, grade over completely into the granites, or by an increase of the plagioclase pass over into the diorites (described below). Where augite replaces the hornblende the rock is called augite-syenite; where mica replaces it, minnette. Nepheline and orthoclase constitute nepheline-syenite.

The range in silica percentage for the typical syenites is between 55 and 65 per cent.

When a magma having the chemical composition of a typical syenite erupts it forms dikes, sheets, and flows, closely resembling the eruptive forms of granite, but without quartz. The loosely applied mining term porphyry is used indiscriminately for the eruptive members of both the granite and syenite families. True eruptive syenite, however, is called trachyte, from the Greek word which means rough. The most typical occurrences are light-colored, ashy-gray rocks, either aphanitic or porphyritic in texture, with usually some glass in the ground-mass. When porphyritic the phenocrysts are of the glassy variety of orthoclase called sanidine. In fact, the entire feldspathic constituent is chiefly of this variety.

The eruptive form of nepheline-syenite is called phonolite because of the ringing sound which thin plates make when struck with a hammer, and certain dike-rocks of the mineralogical composition of nepheline-syenite with pronounced porphyritic texture, are called tinguaites.

**Rock-Families: II. Basic Division; Diorites.**—These diorites are plutonic rocks having a silica percentage running from 50 to 65 per cent. They are of medium acidity, and the magmas from which they are formed may be considered as approaching closely the hypothetical parent magma from which, by the process of cleavage, the other rock-families, acid, basic, and very basic, may be thought of as having originated. Mineralogically they consist of hornblende and plagioclase feldspar. Those in which mica replaces a part of the hornblende are called mica-diorites, while the same constituents plus quartz go by the name of quartz-diorites, granite-diorites, or tonalites. These rocks mark the transition to the granites. Augite-diorites are rocks of the diorite type, in which hornblende is replaced in part by augite. They grade over into the gabbros.

Certain intrusive (dike) rocks of the mineralogical composition of the diorites are called camptonites, while other similar intrusives having both biotite and augite are called kersantites.

Extrusive rocks having the chemical and mineralogical composition of the diorites are called andesites. Typical andesites are aphanitic, felsitic, or porphyritic in texture, and closely resemble the trachytes, the main distinction being that they contain plagioclase (andesine or oligoclase) instead of orthoclase. The ferromagnesian constituent is hornblende, but may be either biotite or augite. The rocks are named because of their common occurrence in the Andes Mountains.

Acid andesites containing free quartz are known as dacites, a name derived from the old Roman province of Dacia, now a part of Hungary.

**The Gabbros.**—The gabbros are coarse to fine-granular, granitoid rocks of plutonic origin, having a silica percentage ranging from 45 to 55 per cent. As originally defined they consisted of plagioclase (labradorite) plus a pyroxene, of the variety known as diaspase; but more recently the name has been applied to a great variety of rocks consisting of a plagioclase (at least as basic as labradorite) plus any kind of pyroxene, either monoclinic or orthorhombic. If olivine be present it is known as olivine gabbro.

The name norite is applied to that member of the gabbro family which consists of plagioclase and enstatite. If olivine be present it is called olivine-norite. The ferromagnesian constituent may fail and the rock thus consist of labradorite feldspar alone, in which case it is known as anorthosite (from the French word for triclinic feldspar).

The accessory mineral constituents are apatite, titanite, ilmenite, magnetite. The first and last mentioned are usually abundant, and the latter may segregate to form ore deposits.

**Diabases.**—These may properly be discussed in connection with the gabbros, for they have the same mineralogical composition, and while they may occur as true plutonic rocks they occur commonly in the form of dikes or sills, and may be considered as the intrusive form of the gabbros. Their chief distinguishing feature perhaps is their texture, which, under the microscope, if not in the hand-specimen, is seen to be ophitic. This, in short, is the essential distinction between the gabbros and the diabases as ordinarily considered. In granularity they range from coarse to aphanitic. They are sometimes strikingly porphyritic, with perfect automorphic phenocrysts of augite imbedded in an aphanitic, ground-mass of augite and plagioclase (labradorite or anorthite). Dolerite is a term used interchangeably with diabase, but refers more particularly to the porphyritic varieties. The basalts or traps are the dense black aphanitic extrusive forms of diabase or dolerite, but they grade over into the diabases by imperceptible stages. The basalts constitute great surface flows of unparalleled extent, covering thousands of square miles. On cooling they frequently break, by shrinking, into hexagonal prisms, which have their long diameters normal to the cooling surfaces. This is known as the columnar structure of basalt, so famously exhibited at the Giant's Causeway, on the northeast coast of Ireland.

Olivine is a more or less constant mineral in the basalts, which have been divided into the

olivine-free and olivine-bearing varieties. More rarely they contain nepheline or leucite in considerable amounts, and are then called tephrites. If both olivine and leucite or nepheline are present they are termed basanites.

**Very Basic Division: Peridotites, Pyroxenites, Hornblendites, and Dunites.**—Rocks of this division, as already explained, include those from which not only free quartz has disappeared, but also the feldspars, at least as notable constituents. They consist essentially of a mixture of ferromagnesian constituents plus one or more of the ores. Olivine and pyroxene (usually augite) together constitute peridotite (from the French word for olivine). If hornblende be substituted for augite the rock is known as hornblende-peridotite. If the rock consists essentially of pyroxene it is called pyroxenite; or of hornblende alone, hornblendite, or of olivine alone, dunite. They have as accessory constituents magnetite, chromite, ilmenite, and apatite. Chromite rarely occurs in such abundance in the peridotites as to be of economic value.

A certain rare basaltic rock of the mineralogical composition of peridotite, consisting of augite and olivine in a glassy ground-mass, occurs at Limburg in Kaiserstuhl, Baden. It is called limburgite. Dense porphyritic rocks consisting of augite and magnetite in a glassy ground-mass represent the effusive member of the pyroxenites, and are called augitites.

**Rocks of Aqueous Origin.**—Rocks deposited in water are called sedimentary, and are always stratified. In this respect they are distinguished from typical igneous rocks, which are unstratified and massive. Sedimentary rocks can be classified as follows: (1) mechanical sediments of terrigenous origin; (2) mechanical sediments of organic origin; (3) chemical precipitates.

**Mechanical Sediments of Terrigenous Origin.**—Included here are all those substances which have been washed from land surfaces and deposited in the seas or other bodies of water, as above explained. The principal varieties are: (1) Conglomerates, otherwise known as pudding-stones. These are solidified gravels, in which coherence is due to some cementing principle (lime, iron, or silica) to pressure, or to both. Where the fragments of rock are angular, as though freshly broken, the rock is called breccia. Breccias are not all of water origin. They are occasionally terrestrial. In either case they have not been transported far from the parent ledge, as their sharp corners indicate. (2) Sandstones, consolidated sand-beds. Where the cement is calcareous they form calcareous sandstones. They are also called siliceous or ferruginous, according to the character of the cement. Argillaceous sandstones contain an admixture of clay. Coarse sandstones containing grains of undecomposed feldspar are called arkose. (3) Shales, solidified clays or muds. They may contain some sand, and are then said to be arenaceous; or they may contain lime in the form of shell-fragments or impalpable limy material, and are then called marls. Marls are thus in part of organic origin.

Mechanical sediments of the character above described accumulate alike in seas and lakes. Those deposits made in the sea are called marine; those made in lakes, lacustrine.

**Mechanical Sediments of Organic Origin.**—These may be the result of the accumulation of

either animal or plant remains. The accumulation of hard parts of animals, such as the shells of mollusks and other mollusk-like forms, the framework of coral polyps and echinoderms, and the microscopic skeletons of some of the protozoans, form the bulk of limestone and other chemically similar deposits. Coquina, the Florida limestone, is composed of a mass of mollusk-shells; crinoidal limestones of the fragmentary skeletons of those marine forms so abundant during Palaeozoic time. Coral limestones are formed by the building up of coral reefs and by the accumulation of fragmentary coral materials and finely divided coral muds, which may be distributed widely over the floor of the ocean by currents, forming compact calcareous rocks. Calcareous accumulations of this particular sort are considered to have been changed to dolomites by the action of the salts of magnesium in the sea-water, on carbonate of lime, replacing part of the calcium by magnesium and forming  $(Ca,Mg)CO_3$  out of  $CaCO_3$ . This imperfectly understood process, by which limestones are changed to dolomites, is called dolomitization. Dolomites and limestones grade into each other and together are among the most common and important rocks of the lithosphere.

Chalk is an accumulation of minute calcareous shells secreted by the lowest forms of animal life, the protozoans, certain forms of which abound in the surface waters of the oceans. When they die their shells rain down through the water and accumulate on the floor of the high seas, forming oozes. The chalks are considered to have originated in a similar manner during past geologic time.

Chief among the accumulations of plant remains is peat, an accumulation of vegetable materials in swamps or moist places. It is a dark brown or blackish residuum left by the partial decomposition of mosses and other vegetable accumulations, not always made strictly in the water, but always in moist places, and usually in the waters of swamps. Similar vegetable accumulations on a most extensive scale have been formed during past geologic time, and now constitute beds of lignite and bituminous and anthracite coal. Diatomaceous or infusorial earth is a silt-like deposit consisting mostly of the microscopic silicious shells of that low order of plants called the *Diatomaceae*.

**Chemical Precipitates.**—Briefly enumerated, these are salt and gypsum, found in alternating beds, and considered to have formed by the evaporation of salt lakes, or by the isolation and evaporation of bodies of sea-water. Calcareous sinter or tufa consists of carbonate of lime, which has been brought up in solution in the waters of hot springs and deposited as porous or cellular material about their vents. It is also deposited from solution in the waters of rivers and lakes, and occasionally forms deposits of considerable extent. Travertine is a more compact form of the same material, as is also Mexican onyx.

**Eolian Rocks.**—In regions unprotected by vegetation, as along sea-beaches, the shores of lakes, or in the region of deserts, the finer sands are picked up by winds and drifted like snow into oval or rounded hillocks called dunes. Often these drifting sands are a menace to agriculture, since they gradually encroach upon and bury under them, the arable land. Sands thus deposited by winds are only rudely stratified. In

## ROCKS

the same manner fine impalpable dust is transported long distances, and gradually accumulates to form loess. The loess deposits of China are locally over 1,000 feet thick. Similar accumulations occur in the United States, Europe, and in Argentina. The Mississippi Valley loesses are believed to have been laid down in water under unusual conditions. True loesses are unstratified, and have a characteristic vertical cleavage.

**Glacial Deposits.**—The great continental glaciers that, geologically speaking, existed only yesterday over a large portion of the continents of the northern hemisphere, left behind them vast amounts of characteristic material, which was in part deposited by the glaciers directly and in part by the waters resulting from the melting of the ice. These latter deposits are therefore partly of aqueous origin, and are called *fluvio-glacial*. Glacial drift is the general term applied to all the materials resulting from glacial action direct or indirect. Glacial till is the dense bluish clay, with numerous imbedded boulders, characteristically striated, formed underneath the glaciers (sub-glacial material). This till-sheet (or ground-moraine) is found over a large portion of the area covered originally by the glaciers, and varies in thickness from zero to hundreds of feet. Other sub-glacial accumulations are called *drumlins*, *till-billows*, *till-tumuli*, *crag-and-tail*, etc. Materials dumped down at the margins of the glaciers in confused heaps are termed *moraines* (terminal, lateral, or medial). Streams flowing within or underneath the glaciers deposited along their courses material (sand, gravel, clay), which remained behind after the melting of the glaciers in elongated ridges called *eskers* or *osars*. Where these streams issued at the margin of the ice-sheets they left irregular mounds called *kames*. Streams flowing on the surface of the ice would likewise accumulate materials of the same sort, which would remain after the melting of the ice as long serpentine ridges known as *super-glacial kames* or *eskers*. These floods of water escaping from the glaciers carried the gravels, sands, and silts far beyond the margins of the glaciers, and deposited them as *deltas*, *fans*, *overwash aprons*, and *valley trains*.

**Metamorphic Rocks.**—The processes of metamorphism have already been described as the result of the action of heat, pressure, and moisture upon deeply buried sediments. There are two kinds of metamorphism: *contact*, and *regional*. *Contact metamorphism* is produced by the heat of intruded masses of igneous material upon the surrounding rocks. The contact zone or area about the intrusion affected by its heat is usually narrow, but it may extend for rods or even miles from the intruded mass. The changes resulting from contact metamorphism are not so important in the production of altered rock-masses as they are in the formation of new minerals, so that they are of more especial importance to the mineralogist.

*Regional metamorphism*, on the other hand, as the name implies, has been exerted over wide areas, and has produced the most profound and far-reaching effects. By it the rocks over many thousands of square miles have been completely altered from their original condition. Sediments consisting originally of loose materials

have been reduced to a fluid, semi-fluid, or pasty condition by the combined action of heat, which has penetrated into them from the interior of the earth, moisture, which everywhere saturates the lithosphere to great depths, and pressure, which at the depth of only a few thousand feet is well-nigh inconceivable. The fluidity of rocks thus produced is more or less akin to the fluidity of true igneous magmas, but with an essential difference. In the case of metamorphism the fluidity is due to solution of the mineral substances in water (superheated perhaps); while in the case of magmas it is due to the solution of one mineral substance in another, water being present as an accessory constituent. To this, heat and pressure must be added, also the pressure, with consequent heat, which comes from the lateral or tangential thrusting-in of the crust of the earth upon itself, due to the slow shrinking of the earth under gravity. As a result of this pressure the older deeper-seated rocks (as well as some of the more recent ones) have been intensely folded, plicated, and sheared, which folding and shearing alone would be sufficient to alter them completely. Metamorphic rocks have other structures developed in them, such as crushing; jointing (series of more or less parallel cracks intersecting each other at nearly right angles and breaking the rock-masses into blocks with rudely parallel sides); faults (produced by the slipping of the walls of rock on either side of a fissure over each other); slaty cleavage (produced by great pressure exerted at right angles to the cleavage surfaces); fissility (the visible separation of rocks into thin laminae, also due to pressure, and attended by slight movement of the laminae on each other); schistosity or foliation (the property of splitting into plates with rough undulating surfaces, due to the parallel orientation of the mineral crystals). This may be cleavage, fissility, or both.

These structures are not confined to the metamorphic rocks, but are common to the sedimentary and igneous. They are more frequent, however, in the older rocks. The same processes of metamorphism, so potent in the transformation of true sediments, are just as efficacious in producing changes in the igneous rocks themselves, by virtue of which processes the igneous rocks frequently become so profoundly altered as to be utterly unrecognizable.

The metamorphic rocks as a class are holocrystalline, and in this respect resemble the igneous rocks of plutonic origin. Their chief varieties will now be considered.

**Gneisses.**—Disintegrated or residual granite consists of disaggregated particles of quartz and more or less thoroughly kaolinized feldspar, with considerable true clayey residue resulting from the complete decomposition of some of the feldspar, all somewhat tinged by the oxide of iron. It is easy to see how a similar assemblage of materials could be brought together upon a sea-beach. By a subsidence of the area and a continued deposition of other sedimentary materials above them, that first assemblage of sand and clay might become so deeply buried as to come within the sphere of metamorphic action. If reduced to a more or less fluid condition by heat, pressure, and moisture, and subsequently allowed again to solidify, it would crystallize out

as quartz, feldspar, and mica. In being so altered it would not necessarily have its original bedding-planes obliterated, and the rock would have the mineralogical composition of granite, but obviously would be of sedimentary origin. A metamorphic rock of such a character would be called gneiss. In the same manner a variety of mixtures might be altered with the same result. Conglomerates are known thus to pass by imperceptible gradations over into gneisses. An arkose might alter to gneiss. If the material originally contained much iron, then hornblende, or some other ferromagnesian mineral, such as biotite or augite, would result, and the rock would accordingly be called hornblende-, biotite- or augite-gneiss. Garnets might result from the metamorphism, and the gneiss would then be called garnetiferous. Fibrolite or cordierite might form, and the rock would be named accordingly.

Igneous rocks such as granites, syenites, or gabbros, by processes of metamorphism, may be altered into gneissic rocks. The chief metamorphic factor in the changing of igneous rocks to gneisses is, however, intense pressure, as a result of which even these most resistant of all rock-masses are made to flow like some viscous substance. This flowing, which is accompanied by more or less shearing, results in producing schistosity or foliation, which is accompanied by a distinct banding exactly simulating original bedding, so that the rocks lose their original massive form and come to resemble altered sediments. A granite in which this secondary banding or foliation had been produced would be called a granite-gneiss; a gabbro similarly altered would be termed a gabbro-gneiss, etc. In general we can say that a gneiss is any holocrystalline, foliated, metamorphic rock, of either sedimentary or igneous origin, which has the mineralogical composition of some one of the plutonic igneous rocks. It is frequently impossible to determine whether certain rocks are true sediments or altered igneous rocks.

**Schists.**—The term schist is applied to any holocrystalline metamorphic rock which, on account of the parallel arrangement of its crystal particles, tends to split more or less perfectly in parallel planes (schistosity or foliation). Clay upon metamorphosis yields mica. If little iron be present it furnishes muscovite (or sericite, its hydrated form), but if much iron be present it produces biotite. From this it follows that clay-beds on metamorphosis furnish mica of some sort or other, and as the rocks are always distinctly foliated, owing to the invariable parallel orientation of the mica-scales, they are called muscovite (or sericite) or biotite schists. Some quartz and feldspar may be present, but if subordinate they are still reckoned among the schists. Rocks of this character mark the transition of the schists into the gneisses. Staurolite, chialtolite, kyanite, stillimanite, albite, and garnet are of frequent occurrence among the mica-schists particularly, and in such cases the schists are designated staurolite or albite mica-schist, etc. Mica-schists range in granularity from coarse- to micro-crystalline, the micro-crystalline varieties being called slates; the finely crystalline intermediate forms, phyllites.

Quartz-schists are essentially quartz-rocks, which contained originally some disseminated

clay that altered to mica, as a result of the presence of which the rock has a schistosity. Many basic igneous rocks of the diabase order on metamorphosis change to hornblende-rocks. Where the are foliated they are called hornblende-schists. If more or less massive they are termed amphibolites. The diabases are very apt, however, to alter to chlorite schists, especially if the original augite was of the aluminous variety, and they may alter to biotite schists.

**Other Metamorphic Varieties.**—Pure quartz-sand metamorphoses to a holocrystalline rock called quartzite. Limestone metamorphoses to a more or less coarsely crystalline rock consisting of grains of calcite. If fine, even-granular, it is known as marble. If coarse-granular, it is called crystalline limestone or simply limestone. But the term marble is used to embrace all crystalline calcite rocks that are susceptible of a polish. Serpentine results from the metamorphosis of basic igneous rocks consisting largely of the non-aluminous varieties of hornblende or pyroxene and olivine. The peridotites are especially susceptible to this change. Anthracite coal results from the metamorphosis of bituminous coal, which in turn is derived from peat or lignite. In certain extreme cases of metamorphism anthracite becomes altered to a graphitic material.

FREDERICK B. PECK, Ph.D.,  
Professor of Geology and Mineralogy in Lafayette College, Easton, Pa.

**Rockstro, William Smith**, English musical composer: b. North Cheam, Surrey, 5 Jan. 1823; d. London 2 July 1895. His first composition was a song 'Soon shall chilling fear assail thee.' In 1844 he studied under Sterndale Bennett and by his advice spent a year at the Leipzig Conservatorium. He was also one of seven specially selected pupils of Mendelssohn, and laid the foundation of his great theoretical knowledge under Hauptman. He edited a series of operas in vocal score, as 'The Standard Lyric Drama.' Rockstro ultimately concentrated his attention on musical archaeology, and his deep and practical knowledge of the ancient methods was fully shown in the 'Dictionary of Music and Musicians,' to which he contributed many articles. He also published a valuable 'General History of Music.'

**Rockville**, rök'vil, Conn., city in Tolland County; on the Hockanum River, and on the New York, N. H. & H. railroad; about 16 miles east-northeast of Hartford. Electric lines extend to Hartford, Ellington, and other nearby places. Nearby is Shenipsit Lake, of which Hockanum River is the outlet. The river has here a series of falls, making in all a descent of 280 feet, and furnishing Rockville with extensive water-power. The city was settled in 1716 by a colony from East Windsor, and was a part of the town of Vernon until 1889 when it was chartered as a city. There are about 20 manufacturing establishments of importance, chief of which are envelope factories, silk and woolen mills, gingham and satinette factories. The principal public buildings are the schools, churches, and the library. The latter cost over \$100,000. There are eight churches, a high school, public and parish schools, two private schools, and a public library. The government is administered by a board of alder-

## ROCKWELL—ROCKY MOUNTAIN SUBREGION

men, four members, and a council of eight members. Pop. (1910) 7,977.

**Rockwell, Alphonso David**, American physician: b. New Canaan, Conn., 18 May 1840. He was graduated at Kenyon College, and the College of Physicians and Surgeons in New York. He is a specialist in electro-therapeutics and neurology, having held a professorship in the former subject in the Post-Graduate School of Medicine and also in the New York State Women's Hospital. He was one of the three commissioners appointed to give advice on the establishment of the new method of execution by electricity adopted by the State of New York. He is the author of 'Relation of Electricity to Medicine and Surgery'; 'Nervous Exhaustion' (1901); and, with G. M. Beard, 'Treatise on the Medical and Surgical Uses of Electricity.'

**Rockwood, Tenn.**, town in Roane County; on the Cincinnati, N. O. & T., the Rockwood & T. R., and the Tennessee Central R.R.'s; about 40 miles west-southwest of Knoxville, and 88 miles north by east of Chattanooga. It is in a coal region in which there are extensive deposits of iron ore. The chief industrial establishments are blast furnaces, foundries, machine shops, and coal yards. The trade is chiefly in coal and in iron products. Pop. (1890) 2,305; (1900) 2,899; (1910) 3,000.

**Rocky Gap, Engagement at.** On 5 Aug. 1863 Gen. W. W. Averell, with a brigade of cavalry and mounted infantry and a 6-gun battery, left Winchester, Va., for a raid into West Virginia, which was to be continued to Lewisburg and the Virginia & Tennessee railroad. He moved by way of Wardensville to Moorefield, and to the upper valley of the south branch of the Potomac, and then to Huntersville, driving back Col. W. L. Jackson's cavalry. As he approached White Sulphur Springs, on the morning of the 26th, he encountered Col. Geo. S. Patton, who, with four small organizations of infantry, two battalions of cavalry, and a battery, in all about 1,900 men and four guns, had been ordered to intercept him, and had taken position at Rocky Gap, the junction of the Huntersville road with the Lewisburg and Kanawha turnpike. Patton was strongly posted, and Averell opened upon him with artillery and disabled two of his guns; but successive charges by Averell's dismounted force, with efforts to flank him, continued during the entire day, failed to dislodge him, and at night, after nine hours' fighting, the contending forces occupied the same positions as in the morning. Averell intended to renew the fight next morning, but, learning that Patton had received reinforcements from Lewisburg, made arrangements to withdraw. At 10 A.M. Patton attacked his left and half an hour later Averell ordered a retreat, which was conducted in good order on the road to Warm Springs, and thence by way of Huntersville to Beverly, which was reached on 31 August. The Union loss was 25 killed, 125 wounded, and 67 missing, a total of 217; the Confederate loss was 20 killed, 129 wounded, and 13 missing, a total of 162.

E. A. CARMAN.

**Rocky Mountain Goat**, a goat-antelope (*Oreamnos montanus*), related to the chamois and serow, which inhabit the heights of the Rocky Mountains and Cascade Ranges between

the forests and the snow line, from the 44th to the 65th degree of latitude. It is about the size of a goat, but is stouter, handsomer and has stronger legs. It is completely covered with long, thick, white hair, which forms an erect mane along the middle of the back from between the horns to the root of the tail; the shoulders are rather humped, and the head is habitually carried low. Both sexes have slender, smooth, black horns, curving backward, about eight inches long and sharp-pointed. Its pure white coat is a capital protection against observation in the midst of the alpine snow, and is unique, as no other white ruminant is known. Dwelling in such solitudes they have little to fear from natural enemies, and fall an easy prey to the human hunter who has the hardihood to pursue them upon the rough mountain peaks, and skill enough to get near to them unobserved. "Their food," says Wister, "seems to be chiefly the short almost lichen-like moss that grows on the faces and at the base of the rocks, and between them in the crevices. . . . I am inclined to believe that the goat keeps consistently to the hills, whatever the season may be, and in this differs from the mountain sheep, as he differs in appearance, temperament and in all characteristics, except the predilection for the inclined plane; and in this habit he is more vertical than the sheep." A variety from the Copper River region, in Alaska, is marked by greater divergence of horns and some other structural characteristics, and has been called *O. kenadyi*. The flesh of the mountain goat is not very good, but its hair was utilized in weaving by the Indians of British Columbia and the coast northward; and its tanned hide has a value in market as a rug. Consult Stone and Crane, 'American Animals' (1902), and authorities on travel and sport in the Northwest.

**Rocky Mountain Sheep.** See BIGHORN; SHEEP, MOUNTAIN.

**Rocky Mountain Subregion**, a rather indefinite zoogeographical region embracing the elevated area occupied by the Rocky Mountains, which zoologically presents certain peculiarities very noticeable to a traveler from either the eastern lowlands or the Pacific coast. The resemblance in the fauna is, indeed, rather to the East than to the West, as the Rockies do not form a zoological "divide" to anything like the extent which the Sierra Nevada does, nor even as completely as does the line of deserts which occupy the great depression of Nevada and Idaho between the Wahsatch range and the Sierra Nevada.

A large number of species of animals and plants extend from the Mississippi Valley to and throughout the Rocky Mountains, in forms which are identical from one side of their wide range to the other, or which shade indistinguishably from one varietal extreme in the East to another in the West. On the other hand the plants and animals common to both California and Colorado are comparatively few. The dry and foodless deserts of the Utah basin form a more potent barrier than the snows and altitude of either Sierras or Rockies. Thus the buffalo formerly wandered throughout the whole network of interior valleys, and there is a special variety which seem never to have left the park-

## ROCKY MOUNTAIN SUBREGION

pastures and scantily timbered defiles; yet Bear River, Utah, on the border of the alkali basin, is the farthest west they ever got south of northern Idaho. The elk, grizzly and bighorn, the mountain goat, white ptarmigan and certain other examples of animals, are common to both the Sierra Nevada and the Rocky Mountain systems; but in all these cases they are species whose range extends far north where both lines of elevation converge in British Columbia. Yet the true "blacktail," or Columbian deer, is never shot east of the Cascades, nor does the Virginian, or willow deer, common enough in the Rockies, wander over to the Cascades or Sierras of Oregon and California.

To a more limited extent the Great Plains on the east serve as a barrier between the commingling of plants and animals indigenous to the mountains on the one hand and the Mississippi Valley on the other. And that this, as far as it goes, is a real barrier, is shown by the fact that many common weeds and trees, which flourish well in Colorado now, had never reached there until carried, either intentionally or accidentally by man; that is, the place was suitable enough to them, but they had never been able to reach it.

The Rockies, then, form a zoogeographical district, which embraces practically the whole system of complicated chains from New Mexico to the borders of Alaska, and there is a curious homogeneity throughout, a long list of insects, mollusks and animals of the lower classes, as well as of trees and herbs, occurring from the Rio Grande to the headwaters of the Saskatchewan, disregarding the difference in latitude, which in flat regions is the most powerful factor governing the distribution of animal and plant life.

This is not exceptionally the case in the Rocky Mountains alone, though here it is conspicuous and well-marked. It is true of the Ural-Carpathian system, of the Scandinavian ranges, of the Andes, of the great East-African system, of which Mounts Kilimanjaro, Kenia, and Gordon-Bennett are peaks; nor is it difficult of explanation. A great mountain-province is really a series of sub-provinces concentrically arranged, or, to put it in another way, heaped on top of one another, for the largest bound, embracing the whole extent of the mountains and their foothills, contains several more or less restricted areas, determined by altitude, just as a vast lowland province, such as the whole eastern half of the continent, contains several well-defined subdivisions according to zones of climate, succeeding one another from north to south. The cause of the natural division of these sub-provinces is precisely the same in both cases, for, whereas in the Mississippi Valley the cooler or warmer average temperature required by each animal or plant for its best development is obtained by moving to the north or to the south, so in a mountainous region too much cold or too much heat can be avoided by moving upward or downward, and climate varies with altitude instead of latitude.

Hence, naturalists who have studied the mountains are able to mark out successive sub-provinces, according to altitude, within the upper and lower borders of which certain forms of life are restricted, appearing neither below, or

above, a limited number of thousand feet, except as occasional wanderers. Botanists have long recognized this.

Of course the number of varieties steadily decreases as one ascends just as on approaching the poles, because the means of supporting life diminish in proportion as a moderate climate and abundant vegetation are left behind. The hardy grizzly can stray to the utmost heights, as he is fond of doing, for his strength, power of locomotion and fasting abilities make it possible; but even he cannot remain there long, since food is very scarce beyond the timber. The eagle and greater hawks may soar above the naked icy crest of the loftiest summits, or perch upon the pinnacles, but they seek their prey and build their nests for the most part at far lower levels. A few small birds, like certain semi-arctic warblers and sparrows (especially the gay *Leucosticte* finches) and one large one (the well-known ptarmigan), the little-chief hare or "coon," which stores in its rocky tunnels a winter larder of roots and stems gathered at the edge of the snow during the brief summer, and a small variety of beetles and other insects more or less subterranean in habits, alone brave the storms and famine involved in continuous residence upon the higher summits.

Next below lies the zone of hardy plants and of a longer list of animals, such as the Canada jay, dusky grouse, several hawks and owls, the kinglets, water-ouzel, snow-birds and *Zonotrichia* finches, the bighorn sheep, and a large variety of insects and snails. Below that, down among the pines and abundant shrubbery of the lower slopes and the foothills, one finds in summer the full measure of Rocky Mountain life.

An examination of these facts discloses that all the inhabitants of the lofty plateaus and the rocky peaks are arctic animals, and some of them, like the ptarmigan, turn white in winter in true arctic fashion. These creatures, finding the same conditions at those great heights to which they are accustomed at lower levels inside the polar circle, can live and flourish on an arctic island, as it were, in the midst of the temperate zone; the long narrow snow peaks of the great range forming a tongue of polar climate stretching half way to the equator. It has thus been possible for the beautiful white goat, whose proper home is in British Columbia, to stray south along the crest of the Sierra Nevada and Rockies as far as these high mountains run, but he must keep upon the very crest, whereas in Alaska he comes down to the shore. The insects and minute life of the peaks of Colorado belong to the same class with (are often identically the same species as) those collected by polar exploring expeditions. The same is true of plants. "Red snow" and arctic lichens may be gathered on Pike's Peak.

It is natural, then, that two different migratory movements should be observable in the Rocky Mountains; one the regular seasonal movement southward in the fall and back in the spring, affecting chiefly those birds that live at the base of the range, or near it; and another movement, which is regularly made by many animals, upward to the cooler and fresher pastures in the summer, and back to the less

## ROCKY MOUNTAIN TROUT--ROCKY MOUNTAINS

snowy and more sheltered dells near the base of the mountains as winter approaches. This vertical migration is very well understood in the case of the game, and the paths which the animals follow are often distinct.

The foregoing facts lead to an interesting generalization. While the southern peaks might be colonized by such stragglers from the north as the goat and the ptarmigan, whose legs or wings enable them to travel back and forth, there is a much longer list of small and practically stationary animals never found in the intervening valleys and totally unable to cross from one peak to another. Hence we must conclude that each lofty mountain top is a habitat by itself, entirely cut off from neighboring peaks where duplicates of its fauna and flora may be collected. On the tops of Mount Washington, in the White Mountains, and Mount Marcy, in the Adirondacks, are insects and cryptogamous plants which do not occur anywhere between these isolated fragments of polar climate and the arctic circle, where the same butterflies, spiders and lichens are widespread and indigenous.

How shall this isolation of strictly circumscribed faunas upon mountain peaks be explained? Clearly it dates back to a time when communication between them existed. The ice-cap which, during the last Glacial Epoch, gradually overspread a large part of the north temperate zone and in the Rocky Mountain region covered the whole extent of their highlands with a thick mantle of snow and filled every cañon with local glaciers, of course crowded southward all the surviving life which had been wont, during the warm Tertiary time, preceding this cold period, to dwell far toward the north.

But when the epoch was on the wane, and the ice-front began to retreat, the relieved earth was again clothed with vegetation and re-tenanted by cold-loving animal life, which advanced northward closely in the rear of the retreating glacier. At a greater distance followed the more delicate animals and plants, gradually spreading northward as the moderating climate permitted, until they had established themselves in isothermal zones as we now find them. But as a subsiding flood will leave, stranded upon the top of the first points to appear above the surface, the driftwood and wreck of the deluge, so, as the warmth of southerly regions at a low elevation has increased, certain colonies of the advance guard of the army of animals and plants have found themselves stranded upon frigid mountain tops— islands of arctic climate— isolated from their fellows by warm valleys and plains in which their kindred speedily disappeared, overcome in the battle for life by the greater increase of lowland species to whom the circumstances were more favorable; but here on the high cold peaks they have been able to keep a stronghold, each in its own in a limited area, though surrounded by utterly fatal conditions.

Consult authorities cited under ZOOGRAPHY, especially the writings of C. Hart Merriam.

**Rocky Mountain Trout.** See DOLLY VANDER TRAUT.

**Rocky Mountains, or Cordilleran System,** the system of mountains which constitute the major axis of elevated lands of North America,

in the western part, extending from the Arctic Ocean on the north to South America on the south, and parallel with the Pacific coast. This great system of mountains is continued along the Pacific coast in South America under the name Andes Mountains (q.v.). Between the Rocky Mountains and the Andes is a pass in Panama not many feet above sea-level. The width of the system varies, the greatest breadth is in the United States, between lat. 38° and 42° N., where it is about 1,000 miles. The width diminishes north and south, increasing again in Mexico and diminishing only with the width of the continent. The highest point of the system is in Alaska, but the highest land mass is in the United States between 35° and 42° and on the eastern side of the system.

**Ranges.**—The ranges on the western boundary, and near the Pacific coast are the Cascade and Sierra Nevada in the United States, the Sierra Madre in Mexico and Central America. West of the Sierra Nevada, in California, is the Coast Range. The eastern chains in the United States, called the Rocky Mountain Range, extend north and northwest in the United States, approach nearer the Pacific in Canada, continuing into Alaska to the Arctic Ocean. On the east of the Rocky Mountain Range is the great central plain of the United States and Canada. Rising abruptly from this plain are many isolated cone-shaped peaks which gradually merge into ranges, forming an almost continuous eastern barrier, composed of short ranges, chief of which are Sangre de Cristo, Colorado or Front Range, Medicine Bow, Big Horn, and Laramie. Farther east, in South Dakota and Wyoming, are the Black Hills, a mountain mass detached from the main ranges. In Wyoming the ranges divide, some extending southeast, others southwest, and several short ranges having an almost east and west trend. Some of the well known interior ranges are Wahsatch, extending through Utah, and forming the eastern wall of the Great Basin, Wind River, Salmon River, San Miguel, and Beaver River. Bitter Root Mountains form the divide between the headwaters of the Colorado and the Missouri Rivers. In Nevada the short ranges are generally north and south, in the central and eastern part there are a large number of short, almost parallel chains. Other noted ranges are the Cœur d'Alene, the Lapwai, and the Blue. The ranges south of the divide in Wyoming have a greater altitude than those north; but some of the southern ranges after leaving Colorado on the south and east, end abruptly, and others slope gradually to the low desert plains. The greatest development is in Colorado.

**Peaks.**—In Colorado there are about forty peaks which are over 14,000 feet in height. Among them are Grays Peak, 14,341 feet in height; Longs Peak, 14,271 feet; Pikes Peak, 14,134 feet. In the Sawatch Range, in Colorado, are Mount Harvard, 14,375 feet, and Mount of the Holy Cross, 14,176 feet. In the mesa region in western Colorado is Uncompahgre Peak, 14,408 feet; and in Sangre de Cristo Range is Blanca Peak, 14,463 feet. Other famous peaks, outside of Colorado, are, in Wyoming, Fremont's Peak, 13,700 feet, in the Wind River Mountains; Mount Hayden, 13,691 feet, in the Sawatch Range. In the Colorado, or Front Range, there are four peaks over 14,000 feet;

## ROCKY MOUNTAINS

in Sawatch Range, 10 peaks; in the Sangre de Cristo, three; in the San Juan, four; in the Sierra Nevada, four. In Park Range (not group) and in the Pikes Peak Group, there is one in each. The highest peaks belong to the Cascade Range. Mount McKinley in Alaska, is over 20,000 feet above sea level; Mount Logan is 19,500 feet; Mount Saint Elias, 18,101; Mount Rainier, 14,444. Many of the peaks of this vast system, especially in the Cascade Range, are extinct volcanoes. In Mexico and Central America there are a number of active volcanoes. Orizaba, 18,300 feet in height; Popocatepetl, 17,887; and Ixtaccihuatl, 17,343, are among the highest active volcanoes.

**Plateaus.**—The great plateau region included in the Rocky Mountain system is in southern Wyoming, eastern Utah, eastern Arizona, western New Mexico, and western Colorado. The lands in Colorado and New Mexico east of the mountain ranges belong to the Great Plain. The Plateau region is bounded on the north by Sweetwater and Wind River Mountains. The general elevation of the whole plateau is about 7,000 feet above sea-level, but in Colorado it has an elevation of 10,000 feet. The Continental divide crosses this plateau; and within its limits are the waters of the three great river systems of the United States, the Mississippi, the Colorado, and the Columbia. The southern part of the plateau has in places an abrupt ending, a steep, almost perpendicular escarpment. The ranges crossing divide the plateau region into sections to which have been given the names Kaibab, Kaiparowits, Aquarius, Colorado, Markagunt, Paussagunt, Paria, Shiwits, Tavaputs, Uinkaret, and others not so well defined as those named. On these broad plateaus are groups of mountains, buttes, and isolated ranges and peaks. There are seven peaks over 13,000 feet above sea-level; five over 12,000 feet and less than 13,000 feet; and 20 over 10,000 feet and less than 12,000 feet.

**Parks.**—The Parks of Colorado are high mountain valleys, known as North, Middle, South, and San Luis, with an elevation of from 6,000 to 10,000 feet, surrounded by ranges of mountains from 3,000 to 4,000 feet higher. The west border of the San Luis Park is formed by San Juan Range, with its high peaks, more than 100 of them over 13,000 feet, bordering it like giant watch towers. The Uintah Range is west of North Park. The Parks, or enclosed mountain valleys in Idaho and Wyoming, are not so high as the Parks of Colorado. The most famous park in the whole Rocky Mountain System is Yellowstone Park (q.v.) in Wyoming, now a Government Reservation. The ranges on the boundaries of the Parks and rising from the Park Valleys, are grouped together as the Park Ranges or Park System. The mountains so designated are bounded on the north by the Laramie Plains, and on the east by the Great Plains. The southern and western boundaries are indefinite. Other noted parks are Monumental Park and the Garden of the Gods, near Colorado Springs. The 500 acres are covered with an extraordinary rock formation, like giant spires and pillars, and some like vast cathedrals. The Yosemite Valley (q.v.) is often classed with the Parks.

**Desert Region.**—Within the area called by this name are vast arid regions, bare bleak

mountains, and localities of almost barren lands, some of which might be made fertile by irrigation, and some fertile valleys. It includes the southern parts of Idaho and Oregon, the western parts of Utah and Nevada, the southeastern part of California, the southwestern part of New Mexico, the southern part of Arizona, and the north central part of Mexico. The Sierra Nevada and Cascade ranges are on the western boundary; and the plateau drained by the Colorado River is on the eastern boundary. The greater part of this region is known as the Great Basin (q.v.) which has no apparent outlets to the ocean. The ranges, as in Nevada, are simple and narrow and separated by broad, level desert valleys.

**Passes.**—Several depressions in the ranges are called Passes, and some have been used for routes for railroads. A famous pass is the Lewis and Clark's, in latitude 47°. Through this pass the Northern Pacific railroad has been built, and at Mullan's Pass it goes through a tunnel 3,850 feet long. The Truckee Pass, 6,000 feet above sea-level; the South Pass of the Wind River Range, Evans' Pass in the Front Range, which is crossed by the Union Pacific railroad, are all well known. In Canada the pass between Mount Hooker and Mount Brown, Athabasca Portage, is 7,300 feet above the sea. In the California mountains there are a number of passes. Where the rivers have cut their channels through the mountains, passes have been formed.

**Lakes, Rivers, and Glaciers.**—The greatest rainfall is on the western slope, where the moisture brought by the winds from the Pacific Ocean falls. In the valleys and on the plateaus, especially where the waters fall down the escarpments, the rivers run through deep cañons, the almost perpendicular sides of which are thousands of feet above the river beds. The rivers of the plateaus have their sources in the Park and Wind River Mountains, and in the Wasatch Range. They have carved out deep gorges, which divide the region into a series of distinct plateaus. Some of the famous cañons of this region are the Grand of the Colorado, the Kanab, and the Marble. The principal rivers within this region are the Green, Colorado, Sevier, Paria, Uintah, and White. The rivers whose head-waters are in the Sierra Nevada Range, flow to the Pacific, except a few, which flow east and are lost in the sands. The Sacramento and the San Joaquin are in the valley between the Sierra Nevada and the Coast Range. The one river comes from the north, the other from the south, almost parallel with the ranges until they unite, when they burst through the mountains and discharge their united waters into the Pacific Ocean. The Columbia is one of the great rivers of this region. Rising on the east side of the Cascade Mountains it flows south for some distance until finally it plunges through the mountains in a series of magnificent cascades, whence the name of the range. The Front Range in northern Montana bears upon its crest for many miles the continental divide which separates the headwaters of the Missouri and the Columbia rivers. The Bitter Root Range separates the Missouri from the Salmon. The greatest water systems of North America have head-waters in the Rocky Mountains. The Colorado toward

## ROCKY MOUNTAINS

the south, the Yukon on the north, and the Columbia are the largest streams that flow toward the Pacific; the Mississippi, the Great Lakes and the Saint Lawrence, and the streams that flow into the Hudson Bay all reach the Atlantic Ocean; and the Mackenzie and its tributaries flow into the Arctic. The Rocky Mountains have many small lakes, formed by springs, and depressions which serve as basins. In the Great Basin are several bodies of salt water, the largest of which is Salt Lake (q.v.). The only crater lake in the United States is Crater Lake in the National Park. The glaciers of the Rocky Mountains are numerous. In Alaska are the largest and greatest numbers among which are Muir, and Malaspina. Mount Rainier (q.v.) has over 30 glaciers, extending over a space of 100 square miles, and some of the ice walls reach a depth of 1,000 feet. The Puyallup and Mowich rivers drain five of the largest glacier rivers of Mount Rainier. A notable feature of these rivers is what is known as glacial tides, which are quite marked in summer time. Between midday and a few hours before sunset, there is an increase in the flow of water at the head of each river; about two feet in the narrowest part of the rivers. The plan is already under way to construct a dam in Puyallup River at a point 1,000 feet above tide-water, and 35 miles from Tacoma, from which the water will be carried by a power canal to a point 10½ miles below, to be precipitated into a large power house in the cañon. The power generated will be transmitted to Tacoma, Seattle, and other places. The vastness of Mount Rainier may be conceived when it is known that the surface, including the hill country at its base, has an area of 3,000 square miles, and scientists who have examined the mountain say it has the greatest ice covering of any elevation on the Western Hemisphere. In other parts of the Rocky Mountains are found vast glaciers, and many of the peaks are ever whitecapped with snow.

**Geology.**—The name "Rocky" Mountains is most appropriate to this vast elevation, for in the mountain range, on the plateaus and in the high valley are numberless naked rocks, such as are found nowhere else in America. The aridity of a large portion of the region prevents the growth of vegetation. Across the plateaus are long lines of cliffs, the sides seamed and carved, the debris accumulating at the base. The greater part of this region has been the scene of great volcanic action. The lava, ashes, and scoria are plainly visible. All the mountains of the Desert Ranges are somewhat similar,—a monoclinical ridge of displacement—a fault (q.v.) on one side and a flexure on the other. The strata, generally, dips one way, the escarped edges of the strata form the front or surface of the ridge. Secondary faults and flexures appear in many places. Granites, sandstones, limestones, and schists are found in many of the ranges of this region. The present arrangement of the mountains is not of ancient date, although this region, since Jurassic time, has been above the sea. The eastern ranges are composed of Mesozoic, Paleozoic, and Tertiary sediments, schists, and granites. The present formation is of the Tertiary period; but the irregularities and unconformities show that this section had alternate periods of sea sub-

mergence and of dry lands. The plateaus are separated, by faults and flexures, into blocks. The buttes have horizontal strata and escarped sides. Some of the plateau mountains had their origin in upheaval, and others are of simple anticlinal structure. The Uintah Range, on the north, has an east and west axis, and is the result of upheaval. The Zuni Range, on the south, is of the same type. Like other adjacent regions this shows alternating sea submergence and dry periods, but the plateaus, since the Cretaceous period, have been above water. During the early Tertiary and the late Mesozoic time the basin region was dry, but the plateaus had large lakes and seas. The present "block arrangement" of the plateaus began in the early Tertiary period. The plateaus are composed of the Mesozoic, Paleozoic, and Tertiary sediments. In some of the deep cañons are found granites and crystalline schists. The Sierra Nevada Range bears the marks of recent volcanic action. In the vicinity of Mount Shasta and Lassen Peak are volcanic masses, and on the west slope are vast sheets of lava. The Coast Range has the Appalachian type. The upheaval of this region began in the later Tertiary period; the ranges are made up of oppressed folds of strata, worn down by rains and rivers; the summits are tipped westward. The Cascade Range contains a number of extinct volcanoes. In Canada there are in the region of this range a number of volcanic plateaus. The whole Rocky Mountain area bears the marks of volcanic action. Much is known of the gigantic formations in this region, and the general geological features; but the scientific study of this vast section is in its infancy.

**Minerals and Mining.**—The Rocky Mountain section is the great treasure region of North America. Almost all the precious and useful minerals are found here in abundance. Gold had been discovered and used by the aborigines, and deserted mines have been found where mining had been carried on in a crude way as early as 1680. Gold exists in nearly all the ranges of the system. Gravel containing coarse gold is found from 20 to 60 and even 100 feet below the surface. Abandoned gold fields were worked over with great profit during the last decade of the 19th century, by using improved methods. There are rich deposits of silver, copper, iron, salt, coal, lead, and in the southwestern part of the United States, petroleum and gas. The placer gold regions in Alaska, and the gold fields of the same territory, have been found thus far (1904) of great extent and value. The value of the fine building stone, the fire-clay, gypsum, all kinds of cement material, are rarely taken into consideration because overshadowed by the value of the gold, silver and copper. The gypsum beds in the northwestern part of Texas and along the foot-hills of the ranges in southern Colorado are of great extent and value. (See separate States and Territories of the United States in the Rocky Mountain region, Canada, and Mexico for more details on MINING and MINERALS.)

**Climate.**—The west slope of the Rocky Mountains, or all that portion which faces the Pacific Ocean, has a milder climate than the central or eastern part of North America in the same latitude. The warm winds from the Pacific Ocean bring heat and moisture. The

rainfall is copious on the western side of the mountains. Like the mountain regions on all parts of the globe, the temperature lowers with increase of altitude, and the winds which here blow over the cold mountain tops and across the plateau region to the eastern slope carry with them neither heat nor moisture. In the southeastern part of this vast region where the mountains become low ranges or foot-hills, in the United States, west of the ranges that parallel the coast, the climate is hot in summer and mild in winter; in the Great Basin region and on the eastern slope of the mountains, extending out on the Great Plains, the climate is marked by aridity. (See UNITED STATES.)

*Flora.*—The great aridity of the region east of the western or coast barrier prevents the growth of vegetation. The surface is exposed to erosive action which is specially rapid at such great elevations, and the denudation becomes more complete as the sand and small disintegrated fragments are swept away by the winds, thus giving no opportunity for the accumulation of soil. A large portion of the central and eastern mountain region, and the western part of the Great Plains require irrigation in order to have vegetation; this is so even in the parts where there is abundant fertile soil. The arid portion of the United States, exclusive of Alaska, is about two fifths of the whole area. The redemption of the arid lands is one of the Nation's problems. Less than 10 per cent of the mountain region is forest-clad; but a larger proportion is covered with verdure, including the portions covered with dwarfed herbaceous, sage brush, and stunted cedars and pines, most of which is useful for fuel but not for building purposes. Crops that mature in a short season and pasturage grasses are found on the foot-hills and valleys, especially along the streams. In some places where a little moisture is carried over the passes, below the snow line, the mountains are covered with the dark evergreen growth of hemlock, spruce, balsam fir, and tall pines; and still further down are interspersed among them the birch, beech, cherry, and various other trees, while along the streams are found groves of cottonwood and willow. Over large districts, however, the forest growth is often exceedingly sparse, and even the grass that covers the plains, and upon which travelers depend for the sustenance for their animals, is parched and disappears in the long droughts to which these regions so remote from the sea are subject. In the sandy regions along the North Fork of the Platte River above Laramie River an extraordinary growth of artemisias and other odoriferous plants is found. They abound in the river bottoms and on the hills, growing to the height of two and three feet, in tough, twisted, wiry clumps. A multitude of flowering plants abound in this region, among which prevail several of helianthus (sunflower), and in the month of September, when they are mostly in bloom, the whole country resembles a vast garden. On the western slope may be found some of the largest trees in the world, many of them over 2,000 years old. The vast forests of the Northwest yield enormous quantities of timber. Not only is there a great variety and amount of plant life, but the vegetation attains a remarkable size. The shrub of the Atlantic region becomes a tall tree on the

Pacific Slope. Like the mountains themselves, the vegetation which covers the western slope is large, massive, dense, and in every way, seems patterned on a gigantic scale. (See CALIFORNIA, *Flora*.)

*Fauna.*—See UNITED STATES

*History.*—The natural history of a region is told by the geology and physical geography. This region is not as old as the Appalachian. The form of the peaks and the irregular surfaces of the slopes differ. The missionary explorers visited the mountainous sections of Mexico and the southwestern part of the United States in the 17th century, but the 'Relations of the Franciscans' have as yet (1904) been only partially translated. A large part of our knowledge of this section came first from the reports of the Government explorations made by Lewis and Clark, in 1804. Other explorations were made by Harmann, Long, Schoolcraft, Bonneville, Nicollet, and Fremont (q.v.). Since 1844 more than 20 expeditions have been engaged in exploring these wild regions, nearly all of them for the United States Government. Since the bill and appropriations of March 1853, the object of most of them has been the determination of the most practicable route for a railroad from the valley of the Mississippi to the Pacific. The history of the railroads across these mountains is largely a history of this region. The story of the strange, weird people called Cliff Dwellers (q.v.) is a most interesting chapter in the history of the efforts of man to use this region for a home. At present the population of this whole section is small. A large portion has less than two inhabitants to the square mile. About one tenth of the whole Rocky Mountain area in the United States has from two to six inhabitants to the square mile; in some places in California, Oregon, and Washington there are from six to eight; near the cities from 18 to 45, and in the San Francisco section, from 45 to 90.

Geological Survey on 'Placer Gold Mining in Alaska in 1902'; 'Mineral Deposits of Bitter Root Range and Clearwater Mountains of Montana'; 'Ore Deposits of Butte, Montana'; 'Wonderland,' an annual issued by the Northern Pacific Railroad; De Nadailla, 'Prehistoric Americans,' for Cliff Dwellers; Lumboltz, 'Unknown Mexico' (1903); Day, 'Mineral Resources of the United States'; Dana, 'Geology'; Thwaites, 'A Brief History of Rocky Mountain Exploration' (1904).

Rococo, rô-kô'kô, or Rocaille, rô-kâl-ê', in architecture a name given to the very debased style and decoration which succeeded the first revival of Italian architecture. It is ornamental design run mad, without principle or taste. The ornament consists of panels with their moldings broken or curved at the angles, and filled with leafage, shell-work, musical instruments, marks, etc. This style prevailed in Germany and Belgium during the 18th century and in France from the time of Henry IV. to the Revolution.

Rod, rôd, Edouard, Swiss author: b. Nyon, Canton Vaud, 31 March 1857; d. 29 Jan. 1910. He studied at Lausanne and Berlin, became editor of the *Revue Contemporaine* at Paris, succeeded Monnier in the chair of comparative literature at Geneva, but subsequently

returned to Paris, and became a collaborator on the *Correspondent*, the *Revue des Deux Mondes*, and other periodicals. Among his works are: 'La Course à la Mort' (1886); 'Les Trois Cœurs' (1890); 'Le Silence' (1894); 'Scenes de la Vie Suisse' (1896); 'Au Milieu du Chemin' (1900); 'Dante' (1891); 'Stendhal' (1892); and 'Essais sur Goethe' (1898). Rod has visited the United States as lecturer before the Cercle Français de l'Harvard.

Rod, called also a pole, or perch, a measure of length, equivalent to  $5\frac{1}{4}$  yards, or 16½ feet. See PERCH; WEIGHTS AND MEASURES.

Rodakowski, rô-dâ-kôv'ské, Henryk, Polish artist: b. Lemberg 1823. He studied art in Paris under Cogniet and finally settled there. His works consist of historical pieces, genre, and portraits, the latest being the best. He received medals in 1852 and 1855 and was made chevalier of the Legion of Honor in 1861. He painted the portraits of Gen. Dembinski (1852); Artist's Mother (1853); Prince Saieha; Count Racynski (1859). Among his historical pieces are 'Sigismund Sanctioning Privileges of Nobility' (1872); 'War Without Fight'; 'Galician Peasants at Church' (1857); 'Battle near Choczym in 1673'; 'King Sobieski Receiving Envoy from Vienna' (1861).

Rodbertus, Johann Karl, yô'hân kârl rôd-bër'toos, German political economist: b. Griefswald 12 Aug. 1805; d. Jagetzow 6 Dec. 1875. In 1829-32 he was in the Prussian civil service. In 1848 he entered his brief political career, as a member of the Prussian national assembly. Then he was for a fortnight minister of education, and in January, 1849, entered the second chamber from Berlin. Rodbertus was the real founder of scientific socialism in Germany. In contradistinction to Marx (q.v.), above whom he is placed by many modern economists, he was not international nor material in his views, but a nationalist and idealist, and expected social questions to be solved by legal methods. Prof. Wagner has called him "the most distinguished theorist of the purely economic side of scientific socialism." He wrote several works in connection with his propaganda. Consult the lives by Dietzel (1886-7) and Jentsch (1899).

Rodd, Sir James Rennell, English diplomat and poet. b. 9 Nov. 1855. He was educated at Haileybury College and Oxford University, and entered the diplomatic service as attaché in 1883. He was attaché at Berlin in 1884, and at Athens in 1888, 2d secretary to Rome in 1891 and to Paris in 1892, secretary of legation at Cairo 1894-1901, and secretary of the English Embassy at Rome from 1901. In prose he has published 'Frederick: Emperor and Crown Prince'; 'Customs and Lore of Modern Greece'; and in verse 'Poems in Many Lands'; 'Feda and Other Poems'; 'The Unknown Madonna'; 'The Violet Crown'; 'Ballads of the Fleet.'

Rodenberg, rô'dên-bêrg, Julius, German poet: b. Rodenberg, Hesse-Nassau, 26 June 1831. He came of a Jewish family of the name of Levy, but adopted the name of his birthplace for his own. He was educated at the universities of Heidelberg, Göttingen, and Berlin, afterward devoting himself to literature and traveling, and since 1874 has been editor of the 'Deutsche Rundschau.' His publications include: 'Jour-

nalistic Life in London' (1899); 'Pictures of Berlin Life' (1885-9); fiction, 'The New Deluge' (1865); 'The Granddier' (1878); etc.

Rodenbough, rô'dên-bow, Theophilus Francis, American army officer: b. Easton, Pa., 5 Nov. 1838. He was educated at Lafayette College, and in 1861 was appointed second lieutenant in the United States army. In the peninsular campaign of 1862 he was captured at Manassas, but was soon exchanged, and at the battle of Gettysburg was in command of a regiment. He was engaged at Winchester, losing an arm in that battle, and was brevetted major for his bravery. In 1865 he was brevetted brigadier-general of volunteers, mustered out of the volunteer service, and was appointed major in the regular army. In 1870 he was retired with full rank as colonel. He was secretary of the Military Service Institution in 1879, its vice-president in 1890-1, assistant inspector-general of New York in 1880-3, and in 1890-1901 chief of the bureau of elections in New York. He has written: 'From Everglade to Cañon with the Second Dragoons' (1875); 'Afghanistan and the Anglo-Russian Dispute' (1886); 'Uncle Sam's Medal of Honor' (1887); 'Sabre and Bayonet' (1897); etc.

Roden'tia, or Glires, an extensive order of Mammalia, represented by such forms as mice, beavers, porcupines, squirrels, rabbits, lemmings, etc. Of the characteristics tooth structures are the most important. The canines are always absent and the incisors large and chisel-like, and, with the exception of the *Leporida*, which have four in the upper jaw, never more than a single pair in each jaw. These teeth consist each of a front layer of hard enamel and a posterior part of softer dentine, which ensures a persistent sharp edge, since the more rapid wearing of the softer dentine leaves the harder enamel of the front surface as a chisel-like edge. These teeth continue to grow from persistent pulps throughout life. The incisors are long and curved, and each forms a segment of a circle. Between the incisors and the molar teeth a wide interval exists. The molars are few, and their crowns may exhibit a variously laminated or tuberculate pattern. This structure of the molars has relation to the motion of the jaws in gnawing, the jaws being so articulated by narrow condyles fitting in longitudinal grooves that they slide backward and forward instead of moving vertically, as in most other animals. The transverse ridges of the molar teeth act therefore in opposition to this sliding motion of the jaws. The molars in some cases (as in the beavers) also grow from persistent pulps and possess undivided fangs. There is always a succession of milk and permanent dentitions. The chief chewing muscle is the masseter, which is greatly developed, while the temporal muscle is small.

The usual number of toes is five on both feet, but the pollex may be rudimentary or absent, and in the hind feet the number may be reduced to four, as in the hares, or to three, as in the agouti, jerboa, etc. Generally they are all clawed, but sometimes, as in the capybara, have hoof-like terminations. The scapula is narrow and remarkable for the long acromion process, and the clavicles are generally well developed, but may be imperfect or absent, as in the hares and guinea-pig. The femur generally possesses

a third trochanter, and the tibia and fibula are distinct or, as in the rats and hares, united. The beaver has the hind feet webbed, to adapt it for its semi-aquatic life. Some rodents have the hind legs of extreme length, as the jerboas. Usually a more or less complete hairy screen extends across the mouth at the narrow region of the palate behind the incisor teeth, thus preventing the entrance into the hinder portion of the mouth of the chips or dust that result from gnawing operations. Many rodents are provided with cheek-pouches for carrying food; usually these open within the mouth, but in the *Geomys* they open externally.

The stomach, generally a simple structure, may in some forms, as the lemmings, become quite complex, and its anterior portion as in beavers, may be provided with glandular appendages. This same portion in the dormouse is glandular and dilated so as to resemble the proventriculus or digestive stomach of birds. A large sacculated cæcum generally exists, and the intestine is usually very long. A gall-bladder is sometimes wanting. The surfaces of the cerebral hemispheres are smooth or destitute of convolutions, and, when viewed from above, the cerebellum is seen to be in great part uncovered by the cerebrum. The corpus callosum is well developed. The penis is usually retractile and contains a bone, and the testes normally remain in the abdomen, but descend periodically into the groin at the breeding seasons. The uterus is frequently completely divided into two cornua or horns, each of which opens separately into the vagina. In others the two cornua unite to form a single uterus or womb. The placenta is of the deciduate type, and of discoid form. Rodents are extremely prolific. Most species of rodents have characteristic and penetrating odors which arise from scent glands variously located in the vicinity of the anus. The skin, generally covered with hair, is spiny in the porcupines (q.v.), some genera of which group possess prehensile tails. Many of these animals furnish furs of value in commerce.

*Extent and Classification.*—This is by far the largest order of mammals, comprising more than 2,000 species. Rodents are found in all parts of the world, but are poorly represented in the Australian region and on Madagascar, and are altogether absent from certain oceanic islands. In South America they reach their maximum development. With a very few exceptions, such as the house-rats and the muskrat, they are exclusively herbivorous, and different species subsist upon grains, nuts, bark, roots, herbage, etc. Notwithstanding their great structural similarity the rodents have fitted themselves to the most varied environmental conditions, and present many remarkable adaptations and interesting habits. Most of them are terrestrial; many, like the mole-rats, rabbits, and prairie marmots, are burrowers; some, as the beaver and muskrat, are aquatic; many squirrels and others are arboreal. They run, leap, climb, or, like the flying squirrels and *Anomalurus*, sail through the air on skinny parachutes. Some, as the woodchuck, are solitary; many are gregarious, like the rats and mice, colonial like the rabbit and prairie marmot, or even, like the beaver, form co-operative societies and exhibit wonderful building instincts. Migratory movements of large parties of rodents are not infrequent, the most remarkable of which

are the well-known migrations of the lemmings. Although generally of small size, the rodents have gained a dominance both of species and individuals through their great fecundity and their ability to gnaw out a living beyond the reach of most animals. Their wariness and secretiveness have aided no little toward their preservation, though they form the chief subsistence of a host of snakes, birds of prey, and small carnivorous mammals. Human interests are affected by these animals in a variety of ways. Some of them furnish food, furs, or sport, others are interesting pets, but the great majority are injurious to agricultural interests. No less than 400 species and many additional subspecies have been described as occurring within the limits of North America, the great majority being mice.

The following is a modern classification of the order, though some mammalogists recognize a larger number of families:

GROUP SIMPLICIDENTATA.—There is a single pair of upper incisors with the enamel layer confined to the anterior surface; the fibula does not articulate with the calcaneum. Three sub-orders:

I. *Hystricomorpha*, or porcupine-like rodents: tibia and fibula distinct, alveolus of lower incisor ending on the medial side of the ramus of the lower jaw, only one premolar in each jaw. Families: *Octodontidae*, containing the coypu and many others chiefly of South America, but a few in Africa; *Hystricidae*, the porcupines; *Chinchillidae*, chinchillas of South America; *Dasyproctidae*, agoutis, etc., of South America; *Dimomyidae*, containing a single generalized rodent of Peru; *Caviidae*, the cavies or guinea-pigs and capybara of South America.

II. *Sciuromorpha*, or squirrel-like rodents: tibia and fibula distinct from each other, the alveolus of the lower incisor penetrating the ramus of the lower jaw and the premolars one or two on each side above and one on each side below. Families: *Sciuridae*, the squirrels and marmots, found throughout the world except Australia; *Anomaluridae*, peculiar squirrel-like animals with extensive parachutes along the sides, found in tropical Africa; *Haplodontidae*, *Haplodon*, of the Rocky Mountains; *Castoridae*, the beavers, of the northern hemisphere.

III. *Myomorpha*, or rat-like rodents: tibia and fibula coalesced, lower incisors as in the squirrels, premolars 3 to 4. Families: *Dipodidae*, jumping mice, jerboas, etc., North America, Europe, Asia, and Africa; *Muridae*, the rats and mice, a very extensive and cosmopolitan group which is variously subdivided: *Myosidae*, dormouse of Europe and other Old World forms; *Geomysidae*, pouched gophers and pouched mice of America; *Lophiomyidae*, a remarkable arboreal African form; *Spalacidae*, the mole rats and their allies of the Old World.

GROUP Duplicidentata.—Besides the large incisors, the enamel covering of which extends all around, there is a second pair in the upper jaw; the fibula articulates, with the calcaneum and the ankle and elbow joints are tongued and grooved; tibia and fibula co-ossified. One sub-order: *Leporidae*, hare-like rodents, with two families: *Leporidae*, hares and rabbits, cosmopolitan; *Lagomyidae*, pikas or whistling hares, North America and Europe.

## RODERICK — RODMAN

**Fossil Rodentia.**—Rodent remains first occur in a fossil state in the Eocene Period, in which remains of forms allied to the dormice, porcupines, and squirrels exist. In Pliocene and post-Pliocene formations they become tolerably plentiful. Of the post-Tertiary forms, *Trogontherium*, or the great beaver, found in European deposits, is a familiar species, and the cave beaver (*Castor spelæus*) is also a notable form. *Trogontherium* may possibly have survived the human period. The hares and rabbits first occur as fossils in Lower Miocene of North America and Pliocene of Europe, and the rats and mice are found in Eocene, Miocene, and Pliocene formations. The guinea-pigs are chiefly Pleistocene, their remains occurring in the Brazilian bone caves of that age. Some of the extinct rodents were as large as an ox. Very little light has been thrown on the origin of the order by a study of the fossil forms, though Professor Cope believed the Tillodonts to be their ancestors.

**Bibliography.**—Consult the articles in this work on the various animals included in the order, and the following: Coles and Allon, 'Monographs of North American Rodentia,' United States Geological Survey of Territories (Washington 1877); Elliot, 'Synopsis of the Mammals of North America,' Field Columbian Museum (Chicago 1901); Beddard, 'Mammals' (London 1902); Alton, 'On the Classification of the Order Glires,' Proc. Zoological Society (London 1876); Woodward, 'Vertebrate Paleontology' (Cambridge 1898); and numerous papers by Merriam, Miller, Palmer, and others in the 'Bulletins' of the Biological Survey of the United States Department of Agriculture.

**Roderick, rôd'ér-ík** (Spanish, *Rodrigo*), last king of the West Goths in Spain. In 710 he was chosen king. Shortly after the Moors, under Muza, invaded Spain. Roderick met the invaders on the banks of the Guadalete in 711, but was defeated, and perished in the battle. Some accounts declare that he maintained resistance for two years longer. He is the hero of Scott's 'Vision of Don Roderick' (1811) and Southey's 'Roderick the Goth' (1814). Consult: Toillan, 'Chronique Rimée des Derniers Rois de Tolède' (1885); Dozy, 'Geschichte der Mauren in Spanien' (1874); Saavedra, 'Estudio sobre la invasion de los Arabes' (1895).

**Rodgers, rôj'èr-z,** Christopher Raymond Perry, American naval officer: b. Brooklyn, N. Y., 14 Nov. 1819; d. Washington, D. C., 8 Jan. 1892. He entered the United States navy as a midshipman in 1833, commanded the schooner Phoenix in the Seminole war in 1840-1, was engaged in blockading service in the Mexican War, and served in the trenches at Vera Cruz and at the capture of Tobasco and Tuspan. He was commissioned commander in 1861, was fleet-captain at the Battle of Port Royal, and also in the attack on the defenses of Charleston in 1863. He was then appointed to command the steam sloop Iroquois and was engaged in special service until the close of the War. He became commodore in 1870, and in 1874 received rank as rear-admiral. He was superintendent of the Naval Academy in 1874-7, in command of the naval forces in the Pacific in 1878-80, and from then until his retirement in 1881 was again superintendent at the academy. He presided

over the convention held in Washington in 1885 for fixing a prime meridian and universal day.

**Rodgers, John,** American naval officer: b. Harford County, Md., 11 July 1771; d. Philadelphia 1 Aug. 1838. He entered the naval service in 1789, and in 1798, as lieutenant and executive officer of the frigate Constellation, captured a French vessel, for which service he was promoted captain in 1799. In 1802 he was appointed to the Mediterranean squadron then engaged in the war with Tripoli, in the success of which he was largely instrumental. He succeeded Commodore Barron in the command of the squadron in 1805, and in this office rendered a valuable diplomatic service in securing treaties from Tripoli and Tunis which established the friendly relations since existing between those countries and the United States. In 1812 Commodore Rodgers, in command of the Atlantic Squadron, was the first to fire upon the British, and during the campaign captured some 23 English vessels. He was president of the Board of Naval Commissioners 1815-37, except during the three years 1824-7, when he was again in command of the Mediterranean Squadron.

**Rodgers, John,** American naval officer, son of the preceding: b. Harford County, Md., 8 Aug. 1812; d. Washington, D. C., 5 May 1882. He was commissioned lieutenant in 1840, and was engaged in the hostilities with the Seminoles from 1840 to 1843. Subsequently he performed a valuable service in surveying the Florida coast. His explorations from 1852 to 1861 in the North Pacific and China seas, and in the Arctic Ocean were also of much scientific and commercial importance. As commander of the monitors Weehawken, Dictator, and Monadnock he took a prominent part in the Civil War. He was made commodore in 1863, and in 1869 commissioned rear-admiral in command of the Asiatic fleet. In this office he rendered valuable service as a diplomat by establishing the safety of American commerce in Korea. At his death he was superintendent of the naval observatory at Washington.

**Rodin, rô-dân,** Auguste, French sculptor: b. Paris November 1840. After working in a subordinate position in several studios he exhibited for the first time in the Salon in 1875, and since then became well known as a sculptor utterly beyond the control of classical convention, and reveling in the first expression of emotion and action, yet showing a power of execution worthy of the best Renaissance art. His statue of Balzac, ordered by the government, was so palpably an attempt to suggest by a plastic achievement something beyond the range of sculptural expression, that it was rejected when exhibited as a cast. Yet he has done some remarkable work, as for instance 'The Brazen Age,' exhibited as a cast, and after much discussion executed in bronze for the Luxembourg Gardens. Among other rugged and fantastic creations are 'Burghers of Calais'; 'The Kiss.' He has made busts of Bastien-Lepage, Victor Hugo, Henri Rochefort, and Jules Daloux, the sculptor.

**Rodman, rôd'man,** Isaac Pease, American soldier: b. South Kingston, R. I., 18 Aug. 1822; d. Sharpsburg, Md., 30 Sept. 1862. He engaged in business as a woolen manufacturer, served several terms in the Rhode Island legislature and

## RODMAN—ROE

In 1861 resigned his seat in the state senate, organized a company, of which he was commissioned captain, and went to the front. He was promoted lieutenant-colonel for gallantry at the first battle of Bull Run, fought at Roanoke Island and at New Berne, N. C., and in 1862 was commissioned brigadier-general of volunteers. He commanded a division at Antietam in 1862 and while leading a charge was mortally wounded.

**Rodman, Thomas Jefferson**, American military officer: b. Salem, Ind., 30 July 1815; d. 7 June 1871. He was graduated from the ordnance department of West Point in 1841, and was appointed to service at various arsenals, where his experiments in the manufacture of guns soon brought him into prominence. His method of casting guns on a hollow core, the metal being cooled by a stream of water running through the inside, was adopted in 1847. This method he later applied to shells and cannon. In 1860 he completed his experiments upon a 15-inch gun for the uses of mammoth powder, the cannon which bears his name. The Rodman gun and mammoth powder were adopted by the United States government in the following year, and soon after by Russia, England and Prussia. In 1865 he was brevetted brigadier-general, and four years before his death promoted to the rank of lieutenant-colonel.

**Rodman Gun.** See **ORDNANCE**.

**Rodney, rôd'nî, Cæsar**, American patriot: b. Dover, Del., 7 Oct. 1728; d. there 29 June 1784. He was the grandson of William Rodney, a large landholder under the Duke of York, in the grant to William Penn, and member of Penn's council. As high sheriff of Kent County and judge of all the lower courts of the Province of Delaware, Cæsar Rodney came into prominence as a statesman. He was a delegate to the Stamp Act Congress held in New York in 1765, and as speaker of that body was largely instrumental in bringing about the first Continental Congress, of which he was also a member. In this capacity he was one of the signers of the Declaration of Independence. In 1775, after the second session of the Congress at Philadelphia, he journeyed through his native province sowing the seed of independence, and was appointed brigadier-general in the army under Washington at the beginning of the Revolution. As commander of the Delaware militia he rendered valuable service, for which he was made a major-general in 1777. In this year also he was made president of the State of Delaware, from which office he retired in 1782.

**Rodney, Cæsar Augustus**, American statesman, son of Cæsar Rodney (q.v.): b. Dover, Del., 4 Jan. 1772; d. Buenos Ayres, Argentina, 20 June 1824. He was graduated from the University of Pennsylvania in 1789, and after his admission to the bar in 1793 practised law in Wilmington, Del. On account of his election to Congress as an anti-Federalist in 1805 he has been called the first Democrat in that body. In 1807 he was appointed attorney-general of the United States by President Jefferson, but resigned this office in 1811, and in the War of 1812 took active part on the Canadian frontier as captain of artillery. In 1821 he again represented Delaware in Congress, and in the following year took his seat in the United States Senate. In 1823 he was appointed minister plenipotentiary to the Argentine provinces.

**Rodney, George Brydges**, 1st **BARON ROSEBURY**, English naval commander: b. Walton-upon-Thames, and baptised 13 Feb. 1718; d. London 23 May 1792. He became a lieutenant in 1739, first obtained a ship in 1742 and in 1748 went to Newfoundland as governor. On his return in 1751 he was elected member of Parliament. In 1759 he was promoted rear-admiral, and in 1761 sailed to the West Indies, reduced Martinique and took possession of St. Lucia, Grenada and St. Vincent. In 1762 he became vice-admiral and in 1764 was made a baronet. The next year he became governor of Greenwich Hospital. In 1779, having already been promoted to the rank of admiral, he was put in command of a fleet bound for the West Indies with instructions to relieve Gibraltar on his way. This latter was accomplished on 16 Jan. 1780 by capturing or destroying seven ships of the fleet of the Spanish admiral, Don Juan de Langara. Continuing on to the West Indies he encountered the French fleet under Guichen, near Martinique, with indecisive results, though with considerable loss on both sides. In April 1782, he again met a French fleet in the West Indies, this time commanded by Count de Grasse; and after a three days' fight overcame the French, captured de Grasse and his flagship, the *Ville de Paris*, but forewent the larger part of his spoil by not giving chase. Before the news of the victory reached England, Admiral Hugh Pigot had been sent to supersede Rodney, and though he retired from active service, he was rewarded with a pension and a barony. Consult: Mundy, 'Life and Correspondence of Lord Rodney' (1830); Hannay, 'Rodney' ('English Men of Action').

**Rodrigues, rôd-rê-gês**, a volcanic island in the Indian Ocean; about 375 miles east by north of Mauritius (q.v.), of which it is a dependency. It is 18 miles long by 7 miles wide, and the altitude is about 1,750 feet. It is surrounded by a coral reef. Its isolation has prevented change in its flora and fauna, and for this reason the island has been of interest to the botanist and the zoologist. Until near the end of the 17th century the solitarie, now an extinct bird, was found on this island. The island was discovered by the Portuguese in 1645, and since 1814 it has been a British colony.

**Roe, Charles Francis**, American soldier: b. New York 1 May 1848. He was graduated at West Point in 1868 and entered the 1st cavalry, being assigned to frontier duty. In 1870 he was transferred to the 2d cavalry; became 2d lieutenant in 1871 and 1st lieutenant in 1880. In his early days in the West he rode 22½ hours from Camp Harney, Ore., to Fort Bidwell, Cal., to carry orders to prevent an Indian outbreak. In 1888 he resigned from the army and engaged in real estate business in New York. He became major of Troop A, New York Volunteer Cavalry, in 1895, and later was appointed major-general. President McKinley appointed him brigadier-general of United States volunteers in June 1898, but he resigned in the following September.

**Roe, Edward Payson**, American Presbyterian clergyman and novelist: b. Moodna, New Windsor, Orange County, N. Y., 7 March 1838; d. Cornwall, N. Y., 19 July 1888. He studied at Williams College, and at Auburn and Union theological seminaries; was ordained to the Presbyterian ministry; in 1862-5 was a chaplain

in the volunteer service; and from 1865 until his resignation in 1874 held a Presbyterian pastorate at Highland Falls, N. Y. There his addresses on topics of the Civil War gained for him some notice as a speaker. In 1874 he removed to Cornwall-on-Hudson, N. Y., where he cultivated small fruits and turned out a series of novels which sold largely (750,000 copies, it was estimated, at his death) and met with widespread interest, but quite lacked distinction or literary quality. Among the titles are: 'Barriers Burned Away' (1872); 'Opening a Chestnut Burr' (1874); 'A Knight of the 19th Century' (1877); 'A Face Illumined' (1878); 'Driven Back to Eden' (1885); and 'The Earth Trembled' (1887). He published also three books on horticulture. Consult 'E. P. Roe: Reminiscences of his Life,' by his sister, May Roe (1899).

Roe, Francis Asbury, American naval officer: b. Elmira, N. Y., 4 Oct. 1823; d. Washington, D. C., 28 Dec. 1901. He entered the naval service in 1841 as acting midshipman on the John Adams, and received his later training at the Naval Academy at Annapolis, and in service in various parts of the world. He was executive officer of the flagship Vincennes during the Arctic exploring expedition of 1855, and was made a lieutenant in that year. At the outbreak of the Civil War he was appointed executive officer of the Pensacola, which was in the van of Farragut's fleet, and was especially commended for bravery during the famous passage of Fort Jackson and Fort St. Philip. In 1862 he was ordered to the gunboat Katahdin and upon the first day of his command fought the battle of Baton Rouge. For this service he was promoted to the rank of lieutenant-commander. On 5 May 1864, in command of the Sassacus, he defeated the Confederate ram Albemarle and the gunboat Bombshell near Plymouth, N. C. As commander of the Gulf Division of Rear-Admiral Palmer's squadron at Vera Cruz he rendered noteworthy service as negotiator between the forces of Gen. Juarez and the governor of Vera Cruz, and received the surrender of that city in 1867. From 1869 to 1871 he was with the Asiatic fleet and was commissioned captain in 1872. In 1884 he was promoted rear-admiral and was retired the following year.

Roe, Richard. See DOE, JOHN.

Roe-deer, a small European deer (*Capreolus caprea*), the adult measuring about two feet at the shoulders and about 2½ feet at the hind quarters. The buck's antlers are small, and provided with three short branches only. The general body-color is a brown. The tail has a white patch at its root and the chin, belly and inner aspects of the limbs are grayish-white. These animals inhabit mountainous districts, and are monogamous, each male remaining faithful throughout life to one female. The habits of the roe are somewhat like those of the goat, or even of the chamois. It keeps its footing on rocks with great security, bounds very actively, and takes great leaps. Its usual pace, when not very hard pressed, is, however, a kind of canter. It is not gregarious, not more than a buck and doe with one or two fawns being usually seen together. The voice of the

roe-deer, resembling that of a sheep, but shorter and more barking, is often heard through the night. The roe browses on the tender shoots of trees and bushes as well as on herbage, and is thus very injurious to young woods. It is never very thoroughly tamed, and when kept in parks is apt to become mischievous, and the male dangerous. The venison is superior to that of the stag, but not equal to that of the fallow deer. The horns are used for handles of carving knives and similar articles.

Roebling, reb'ling, John Augustus, American civil engineer: b. Möhlhausen, Prussia, 12 June 1806; d. Brooklyn 22 July 1869. He was graduated at the Royal Polytechnic School in Berlin in 1826, his thesis being on suspension bridges. He came to America in 1831 and settled in Pittsburg, Pa. Later he was engaged in surveying the lines of the Pennsylvania railroad across the Allegheny Mountains from Harrisburg to Pittsburg. Having spent some years thereafter in the manufacture of iron and steel wire he utilized his new product in 1844-5 in building an aqueduct across the Allegheny River at Pittsburg, consisting of a wooden trunk supported by wire cables. The bridge comprised seven spans each 162 feet long. In 1846 he built a suspension bridge over the Monongahela River at Pittsburg, and after building several other bridges removed his business to Trenton, N. J., and in 1851 began the construction of the suspension bridge across Niagara River, connecting the New York Central and the Canadian Railway systems. He next built the bridge over the Allegheny River at Pittsburg and during 1856-67 the bridge connecting Cincinnati and Covington. In 1868 he was chosen chief engineer for the construction of the Brooklyn Bridge; but he died the following year from the effects of an injury to one of his feet. The completion of the structure was carried out by his son. He was the author of 'Long and Short Span Railway Bridges' (1869).

Roebling, Washington Augustus, American civil engineer: b. Saxonburg, Pa., 26 May 1837. He was graduated at the Rensselaer Polytechnic Institute, Troy, N. Y., in 1857, and joined his father, John A. Roebling (q.v.), in the construction of the suspension bridge across the Allegheny River at Pittsburg. He served in the Union army, 1861-3; was brevetted lieutenant-colonel in December 1864 for gallant service before Richmond and colonel of volunteers in March 1865 for meritorious service during the war. He joined his father in building the Cincinnati-Covington suspension bridge and became assistant engineer in constructing the Brooklyn bridge. After his father's death in 1869 the entire direction of the work was left in his hands and the bridge was completed in 1883. Since that date he has been engaged as vice-president of the iron and steel wire and wire rope manufacturing concern of John A. Roebling & Sons Co. of Trenton, N. J.

Roeblingite, a white, massive mineral, recently found at Franklin Furnace, N. J., having the remarkable composition,  $H_2CaPb_2Si_2O_{10}$ , which is interpreted by Penfield as being a combination of five molecules of the silicate  $H_2CaSiO_4$  with two molecules of the basic sulphite,  $CaPbSO_4$ . This is the only known occur-

rence of a sulphite in nature. Named after W. A. Roebing.

**Roebuck**, rō'būk, John Arthur, English politician: b. Madras, India, 29 Dec. 1802; d. London, England, 30 Nov. 1879. He was called to the bar in 1831. In 1832-7 and in 1841-7 sat in Parliament for Bath, and for Sheffield in 1849-68 and again from 1874 until his death. He defended the Crimean war, favored the Confederacy in the United States, and supported Beaconsfield in his Eastern policy in 1877-8. In 1879 he became a member of the privy council. He wrote: 'Colonies of England' (1849); 'History of the Whig Ministry of 1830' (1852); etc.

**Röddiger**, ré'dig-ér, Emil, German Orientalist: b. Sangerhausen, Thuringia, 13 Oct. 1801; d. Berlin 15 June 1874. He studied at Halle, where in 1830 he became extraordinary and in 1835 ordinary professor of Oriental languages. He removed to a similar post in Berlin in 1860 and remained there until his death. He continued the work of Gesenius' 'Novus Thesaurus Philologicus Criticus Linguae Hebraeae et Chaldaeae Veteris Testamenti, Editio ii.' with indexes, additions, and corrections (1858). He edited Gesenius' 'Hebrew Grammar,' and wrote 'De Origine et Indole Arabicorum Librorum V. T. Historicorum Interpretationis Libri Duo' (1829).

**Roslofs**, ré'lōfs, Willem, Dutch painter and naturalist: b. Amsterdam 10 March 1822. He early made his home in Utrecht, where he learned to appreciate the beauty of the Netherlands landscape. In 1845 he began his art career in The Hague and three years later went to Brussels, thus completing his studies of the Dutch masters. From Belgium he passed to France and received the great artistic impulse of his life from the French landscape painters who represent the aspects of nature as interpretative of spiritual moods. Thus he learnt to depict what we may style the transitions of color and light in scenery with a certain dramatic intensity, and preferred the portrayal of dazzling light effects, and violent contrasts in color; as when the sunlight pours like a torrent through gaps of leafage into the dark forest depths. He has traveled through the whole of Holland and gathered subjects and motifs for his pictures from many obscure and unfamiliar spots, painting with equal facility in oil and water color. He is also a skilful etcher. As a naturalist he is well known among students of entomology.

**Roentgen**, rént'gên, Wilhelm Konrad, German physicist: b. Lennep, Prussia, 27 March 1845. He was educated at Zürich; became Kundt's assistant at Würzburg in 1870, and at Strasburg in 1872; was made lecturer at the latter in 1874; and professor extraordinary in 1876. In 1879 he was appointed professor ordinary at Gießen, in 1888 at Würzburg, in 1899 at Munich. He published in the 'Annalen der Physik und Chemie' the results of numerous experimental labors; but he is best known for his discovery in 1896 of the Roentgen rays (see X-RAYS) which proved capable of such wide application in surgery and other fields, and for which he received in 1901 the Nobel prize for physics.

**Rogation Days**, the Monday, Tuesday and Wednesday next before Ascension Day: so called because they are observed as days of solemn supplication, with processions and chanting of the Litanies (Greek, *litanieis*, supplication; equivalent to Latin *rogatio*). The custom of processions on these days had its rise in the city of Vienna in Gaul about the middle of the 5th century, when, the city having been visited with earthquakes, fires, and other grave calamities, the bishop, Saint Mamertus, ordered a solemn fast and public supplication of three days to appease the divine indignation; and thereafter the three days' supplication was practiced annually, the custom spreading throughout Gaul and beyond the Alps. Everywhere these processions were suppressed in England after the triumph of the Reformation, yet in some localities the perambulation of the boundaries of parishes on the "gang-days" is said still to be kept up. See also LITANY.

**Roger I.**, count of Sicily: b. Normandy about 1031; d. Mileto, Calabria, 1101. Roger's brothers, Drago, Humphrey, William, and Robert Guiscard, had acquired fame in Italy, and obtained possession of the county of Aversa, when he was summoned thither by his brother, Robert, and landed in Apulia in 1057. The two brothers, Robert, the eldest, and Roger, the youngest, founded the kingdom of the Two Sicilies. Roger in 1063 defeated the Saracens at Ceramium, and was thereupon confirmed by the pope in all his conquests in Sicily. He took the title of Count of Sicily, and in spite of certain disputes between the brothers, the complete subjugation of Sicily was the result of their joint efforts. After the death of Robert Guiscard in 1085 the Norman power in Italy came into Roger's hands. The general support given to him by the pope freed him from many dangers. In 1098 he gave him a free brief (the genuineness of which has, however, been questioned), that he would send no legate to Sicily without Roger's consent, and left it to him to decide what bishops should attend the general assemblies of the Church and whom he should detain for the service of the kingdom. With this extension of his spiritual rights Roger introduced many important improvements. Consult Schack, 'Geschichte der Normannen in Sicilien' (1889).

**Roger II.**, king of Sicily: b. about 1095; d. February 1154, second son of Roger I. His elder brother, Simon, died in 1102, and during his minority the government was administered first by his mother, Adelheid, a daughter of the Margrave Boniface of Montserrat, and then by Prince Robert of Burgundy. The free barons of the land, however, leagued with Pope Honorius II. to break the Norman ascendancy. They had no success, and the pope voluntarily confirmed Roger in the possession of Apulia and Calabria. Pope Anacletus extended the confirmation to Capua and Naples; and in 1130 Roger received the title of king. He now pressed so hard upon the barons that Rainulf of Avellino, Robert of Capua, Servius of Naples, and others revolted, receiving support from the German and Greek emperors, Lothar and Emmanuel, and the influence of the anti-pope, Innocent II., who excommunicated the Sicilian monarch. Roger in 1132 was defeated by them in

## ROGER DE HOVEDEN—ROGERS

an engagement; but having promptly assembled a new army suddenly recovered all he had lost, and although the revolt lasted till 1136 it terminated to Roger's advantage. He took Malta and the adjacent islands, and afterward made himself master of Tripoli. With a second fleet he sailed to Madia, and took it in 1148. At the same time he led an expedition against the kingdom of Greece, in which he took Corfu and Thebes, and plundered Corinth, Athens, Cephalonia, and Negropont. In 1152 he extended his dominion from Tripoli to Tunis, and from the desert of Mohrab to Kairwan. The peace which followed he turned to good account, reforming the law, introducing order into the administration, and patronizing science. Consult Schack, 'Geschichte der Normanen in Sicilien' (1889).

**Roger de Hoveden**, English historian: lived in the last half of the 12th century; d. Hoveden, now Howden, East Riding of Yorkshire. He was a lawyer, in holy orders, and lived at the court of Henry II., whom he served in many diplomatic and professional capacities. His latter days were spent as a prebend of the collegiate church at Howden, to which he had retired on the death of his royal master. The history or chronicle which he wrote during his half monastic retirement was based upon 'Historia Saxonum vel Anglorum post Obitum Bedæ' (1101). The main additions made by Roger de Hoveden to this work include: the miracles of Edward the Confessor; an abstract of the charter by which Hominburgh and Brackenholm were ceded by William the Conqueror to Durham; a list of French knights at the siege of Nice. Naturally the most valuable part of the Chronicle is that which relates to the time in which Roger lived (1169-92). Edward I. in 1291 caused diligent efforts to be made to secure a copy of it, that he might collect therefrom evidence bearing on the vexed question as to the homage due the king of England from the Scottish Crown. The Chronicle was first printed in 1666. Consult Morley, 'English Writers' (Vol. III.).

**Roger of Wendover**, English chronicler: d. 1237. He was a monk in Saint Alban's Abbey, and lived to be prior of Belvoir. His chronicle extends from 1189 to 1235, and bears the title 'Flores Historiarum' in the 'Historia Major.' His collaborator was John de Cellis, and the work was continued by Matthew of Paris. Consult Morley, 'English Writers.'

**Roger Williams University**, an institution for the education of the colored race at Nashville, Tenn. It was established in 1863 by the Baptist Home Mission Society. Its work is in three grades, elementary, secondary, and collegiate; a classical, a scientific, an English, and a normal course are offered; there is also provision for professional instruction and for industrial training in printing, sewing, etc. The institution is supported by the Baptist Home Mission Society and by tuition fees; there is no endowment; the income in 1903 amounted to \$9,400; the grounds and buildings were valued at \$150,000; and the library contained 6,000 volumes. The students number about 250, and the professors and instructors 14.

**Rogerenes**, rôj'ér-enz, The, the name given a former evangelical sect at New London,

Conn. They were of non-resistant principles, and were resolutely opposed to any dictation regarding religious observances, aside from the teachings of the New Testament.

**Rogers, rôj'érz**, Fairman, American civil engineer: b. Philadelphia 15 Nov. 1833; d. Vienna, Austria, 23 Aug. 1900. He was graduated from the University of Pennsylvania in 1853, was lecturer on mechanics at Franklin Institute, Philadelphia, in 1853-65, and professor of civil engineering at the University of Pennsylvania 1855-70. He was a volunteer in the Union army in 1861 and completed the survey of the Potomac River northward from Blakiston Island in 1862. He was a trustee of the University of Pennsylvania in 1871-86, presented to the university a valuable library of works on engineering in 1878, and finally resigned his trusteeship because of continued residence abroad. Besides various valuable scientific papers he wrote: 'Terrestrial Magnetism and the Magnetism of Iron Ships' (1883); and 'Manual of Coaching' (1900).

**Rogers, Henry**, English Congregational clergyman and essayist: b. St. Albans 18 Oct. 1806; d. Pennal Tower, Machynlleth, Wales, 20 Aug. 1877. He studied at Highbury College and became a Congregationalist minister at Poole, Dorsetshire, in 1829. Three years later he was appointed lecturer on rhetoric and logic in Highbury College, and in 1836 became professor of English language and literature in University College, London. He was made professor of English language and literature and mental philosophy in Spring Hill College, Birmingham, in 1839, and held that post till 1858 when appointed principal and professor of theology in the Lancashire Independent College. From 1839 he contributed regularly to the 'Edinburgh Review,' some of his contributions to that periodical being collected in 'Essays Critical and Biographical' (1874), and 'Essays on Some Theological Controversies' (1874). His chief work, 'The Eclipse of Faith,' a piece of skilful dialectics, was published anonymously in 1852, being followed by a 'Defence of the Eclipse of Faith' (1854), in which he replied to F. W. Newman's reply to his earlier work.

**Rogers, Henry Darwin**, American geologist: b. Philadelphia 1 Aug. 1808; d. near Glasgow, Scotland, 29 May 1866. He was appointed professor of physical sciences at Dickinson College, Carlisle, Pa., in 1830, studied in London in 1831, was lecturer on geology at Franklin Institute in 1833-4, and in 1835-46 was professor of geology and mineralogy at the University of Pennsylvania. In 1835 he made a geological survey of the State of New Jersey, and was appointed geologist in charge of the survey of Pennsylvania in 1836. The survey was interrupted in 1841-51 by lack of appropriations, and Rogers was engaged as an expert for various coal companies, until he resumed the survey which was then concluded in 1854. The final report of the survey was entrusted to him, and he completed the work in Edinburgh. From 1857 until his death he was professor of geology and natural history at the University of Glasgow. He published: 'Description of the Geology of the State of New Jersey' (1840); 'The Geology of Pennsylvania, a Government

Survey' (1858); numerous geological reports.

**Rogers, Henry H., American capitalist:** b. Fairhaven, Mass.; d. 19 May 1909. He was educated in the schools of his native town, and afterward became connected with the Standard Oil Company, of which he was a large stockholder and a vice-president. Of the great wealth acquired through his business enterprises he devoted large sums to public and benevolent uses, especially for the benefit of Fairhaven. Among his gifts to the town are two schools, a town hall, the Millicent Library (a memorial to his deceased daughter), a Masonic building, and memorial church buildings, comprising a group said to be excellent examples of Tudor architecture, the church itself being perhaps the finest of its size ever built in America. These buildings were erected in memory of the giver's mother. He also built at Fairhaven, and presented to the Millicent Library, a system of waterworks from which it derives an income; and as superintendent of streets he made, presumably in great part at his own expense, vast improvements in the public highways.

**Rogers, Henry J., American inventor:** b. Baltimore, Md.; 1811; d. there 20 Aug. 1879. He is known as the inventor of a code of flag signals, adopted by the United States in 1846, and was also the originator of a code of signals in which colored lights are used. As an associate of Samuel F. B. Morse (q.v.) he was instrumental in constructing the first telegraph line, and was the inventor of several important telegraphic instruments, and was one of the organizers of the first telegraph companies in the United States, the Magnetic Telegraph Company, established in 1845. He served in the Civil War as acting master of the volunteer navy. Subsequently he was prominently identified with the American, the Bankers' and Brokers', the Southern and Atlantic, and the Western Union Telegraph companies. His writings include: 'The Telegraphic Dictionary and Seaman's Signal Book' (1845); 'The American Code of Marine Signals' (1854); and, in collaboration with W. F. Larkins, 'Rogers' Commercial Code of Signals for All Nations' (1859).

**Rogers, Henry Wade, American lawyer:** b. Holland Patent, N. Y.; 10 Oct. 1853. He was graduated at the University of Michigan in 1874 and was admitted to the bar in 1877. In 1883 he became professor in the law school of the University of Michigan and was its dean from 1885 to 1890. From 1890 to 1901 he was president of Northwestern University, and in the latter year became connected with the Yale Law School, where he is at present dean. He has written: 'Illinois Citations' (1881), and 'Expert Testimony' (1883).

**Rogers, Howard J., American educator:** b. Stephentown, N. Y.; 16 Nov. 1861. His early education was obtained in public schools and at the Pittsfield, Mass., High School; after graduating in 1880 he entered Williams College, from which he was graduated A.B. in 1884. He was admitted to the New York State Bar in 1887. From 1884-92 he was teacher of history and literature in the Albany Boys' Academy; superintendent of the New York State Educational Exhibit at the World's Columbian Exposition, Chicago, 1892-4; acting-secretary of the

New York Commission there, and editor of the official report of the commission, 1894-5; Deputy-Superintendent of Public Instruction, New York State, 1895-1901; Director of Education and Social Economy for the United States Commission at the Paris Exposition of 1900. At the St. Louis Exposition, 1904, he was Chief of the Departments of Education and of Social Economy, and also Director of Congresses and editor of the Proceeding of the International Congress of Arts and Sciences. In April, 1904, he became First Assistant Commissioner of Education of the State of New York, having charge of Higher Education. He was decorated, in 1901, by the French Republic with the Order of the Legion of Honor of France, and promoted to the rank of *officier* in 1904; in 1904, by King Victor Emanuel III. of Italy, with the Order of Chevalier of Saint Maurice and Lazare; by King Oscar II. of Sweden, with the Order of the North Star; and in 1905, by Emperor William II. of Germany, with the Order of the Red Eagle, rank of officer, and by King Leopold II. of Belgium with the Royal Order of Leopold.

**Rogers, Jacob S., American manufacturer:** b. Paterson, N. J.; 1823; d. New York 2 July 1901. In 1856 he became head of the Rogers Locomotive and Machine Works of Paterson. He retired from active business in 1897, and upon the completion of outstanding contracts closed the works 1 Dec. 1900. He bequeathed the bulk of his estate to the Metropolitan Museum of Art, New York. Litigation was begun by other legatees, but a settlement was effected by the payment to these of \$250,000. The residuary estate, about \$5,000,000, went to the museum.

**Rogers, James Edwin Thorold, English economist:** b. West Meon, Hampshire, 1823; d. Oxford 12 Oct. 1890. He was educated at King's College, London, and at Oxford, took orders in the Established Church, and appointed curate of St. Paul's, Oxford. After 1860 he lost sympathy with the Tractarian movement and in 1870 was the first to take advantage of the new Clerical Disabilities Relief Act to resign his orders. He received the Tooke professorship of statistics and economic science at King's College, London, in 1859. In 1862 he was elected for five years Drummond professor of political economy at Oxford, but failed of reelection at the end of that term on account of his advanced religious views. He was again elected to the chair in 1888, however, after the death of Bonamy Price, who had held the post in the interval. In 1880 he entered Parliament for Southwark and in 1885 was elected for Bermondsey; but his adoption of Gladstone's home rule policy in 1886 lost him his seat in the general election of that year. His great work is his 'History of Agriculture and Prices in England' (1866-93), covering the period from 1250 to 1793. Based upon this was his 'Six Centuries of Work and Wages' (1884).

**Rogers, James Guinness, English Congregational clergyman:** b. Enniskillen, Ireland, 29 Dec. 1822. He was educated at Trinity College, Dublin, and at Lancashire Independent College. He held his first charge at Newcastle-on-Tyne in 1846-51, was pastor at Ashton-under-Lyne 1851-65, and from the last-named date until 1902 was minister of the Clapham Congregational Church in London. He has published: 'Priests and Sacraments' (1870); 'Present Day Religion and Theology' (1887); 'Christ for the

## ROGERS

**World** (1895); **'The Christian Ideal'** (1898); etc.

**Rogers, John**, English Reformed clergyman, first martyr in the Marian persecution: b. Deritend, Aston parish, near Birmingham, about 1500; d. London 4 Feb. 1555. He obtained his education at Cambridge, in 1532-4 was rector of Trinity the Less, London, and then went to Antwerp as chaplain to the English merchants there. There, it is said, he was led by William Tindal, then busy on the translation of the Old Testament into English, to change his religious views. He then took charge of a Protestant congregation at Wittenberg, and prepared for the press an English rendering of the Bible, including Tindal's New Testament, and Old Testament as far as the end of 2 Chronicles. His part in the translation was slight, but his marginal notes formed the earliest English commentary on the Scriptures. The whole constituted the second complete version in English, Coverdale's having appeared in 1535, while this appeared, with the pseudonym "Thomas Matthew" on the title-page, in 1537. In 1548 Rogers returned to England, in 1550 was simultaneously made rector of St. Margaret Moyses, London, and vicar of St. Sepulchre there. In 1551 he received the prebend of St. Pancras in St. Paul's cathedral. In 1553 he preached twice at Paul's Cross, the second time against Catholicism (6 August), three days after Queen Mary's arrival in London. He was shortly deprived of the emoluments of his benefices, on 27 Jan. 1554 imprisoned at Newgate at the instance of Bonner, new bishop of London, and after two examinations (22, 29 January), was burned at the stake at Smithfield; showing, says Fox, "most constant patience, . . . exhorting the people constantly to remain in that faith and true doctrine which he before had taught." Consult Fox, *'Book of Martyrs'*; and the biography by Chester (1861).

**Rogers, John**, American sculptor: b. Salem, Mass., 30 Oct. 1829; d. New Canaan, Conn., July 1904. In early life he developed a talent in clay modeling; and in 1858 went to Europe where he studied under the best masters in Paris and Rome. He returned to the United States in 1859, and modeled a large number of statuettes, of which his first group, *'The Checker Players,'* attracted popular attention. Many of these *'Rogers Groups'* pertained to the Civil War and elicited general popular approval rather than the unstinted admiration of the art critic. He also executed the equestrian statue of Gen. Reynolds, now at the city hall in Philadelphia.

**Rogers, Randolph**, American sculptor: b. Waterloo, N. Y., 6 July 1825; d. 15 Jan. 1892. He studied art in Europe from 1848 to 1850 when he returned to the United States, where he executed a statue of Bulwer's blind heroine *'Nydia'* and a figure of President John Adams. He for five years had a studio in New York, but established himself in Rome in 1855. In 1858 he began the bronze doors for the Capitol at Washington and subsequently executed several portrait statues and memorial monuments in Providence, Richmond, Detroit, and other cities. His colossal figures of Gen. Lewis and Nelson, for the Washington monument, which Crawford had begun to raise near Richmond, are good specimens of his work. Among his other statues

is that of Seward in Madison Square Park, New York. Perhaps one of his best works is the figure of the *'Resurrection Angel'* for the tomb of Col. Colt in Hartford, Conn.

**Rogers, Robert**, American author and soldier: b. Dunbarton, N. H., 1727; d. England about 1800. He raised a company of soldiers known as *'Rogers' Rangers'* and commanded them efficiently during the French and Indian War of 1755-63. He visited England in 1765 and was appointed governor of Mackinaw, Mich., but while holding this office was charged with designs for delivering his own fort to the French and was sent to Montreal in irons. At the outbreak of the American Revolution he declined a commission in the Colonial army, though professing a sincere interest in the cause of the colonies, and later aroused the suspicions of Washington. He was secured but was released on parole, which he broke, accepted a commission in the British army and organized the *'Queen's Rangers,'* recruits to which he promised their "proportion of rebel lands." Shortly after 1776 he went to England. He was proscribed and banished by the provincial government of New Hampshire in 1778. Further traces of his life are lacking. He wrote: *'A Concise Account of North America'* (1765); *'Ponteach, or the Savages of America,'* a tragedy in verse, now very rare (1766); and *'A Diary of the Siege of Detroit in the War with Pontiac,'* first published in 1860.

**Rogers, Robert Cameron**, American poet: b. Buffalo, N. Y., 7 Jan. 1862. He was graduated from Yale in 1883, and has since published *'Wind in the Clearing and Other Poems'; 'For the King and Other Poems';* and in prose, *'Will o' the Wisp,'* a sea tale; and *'Old Dorset: Chronicles of a New York Country Side.'*

**Rogers, Samuel**, English poet: b. Stoke-Newington, London, 30 July 1763; d. London 18 Dec. 1855. After completing his attendance at private school he entered the Rogers banking establishment as a clerk, but his favorite pursuits were poetry and general literature. He went, on one occasion, to pay in person his respects to Dr. Johnson; but hurried away in dread of raising the knocker. In 1786 he printed anonymously *'An Ode to Superstition, with Some Other Poems.'* His *'Pleasures of Memory,'* with which his name is principally identified, appeared in 1792. It is a carefully finished and graceful production, but somewhat deficient in force and vigor, and though every one is familiar with the name, the *'Pleasures of Memory'* is a poem that at the present day is comparatively little read. It was received with unbounded applause, and the reputation of the author was still further confirmed by the publication in 1798 of *'An Epistle to a Friend and Other Poems.'* He now built the celebrated house in St. James' Street, Westminster, which he had in part decorated by Stothard and Flaxman; filled with antiques, books, and art-works, all selected in admirable taste, and long made the centre of intellectual society. It ought also to be recorded that, though possessed of much surface brusqueness, and bitter of tongue, no man was more generous in relieving distress or assisting struggling genius; and Sheridan, Moore, Campbell, and others, were all indebted

at different times to his generous liberality. He published in 1810 his poem of 'Columbus,' which was severely handled by the 'Quarterly Review,' and met with little success. 'Jacqueline, a Tale,' appeared in 1814, in the same volume with Lord Byron's 'Lara.' The same year he visited Paris, extending his tour to Italy, and remained abroad for several years. On his return in 1819 he published the poem of 'Human Life,' and in 1822 appeared the first part of his 'Italy,' a series of poems descriptive of the scenery and antiquities of that country, and perhaps the finest of all his works. Continuations of it followed at successive periods, and a complete edition in 1830, beautifully illustrated by Prout, Stothard, and Turner, which, with an illustrated edition of his other poems, composes two 8vo volumes, and was issued at a large outlay to the author. It proved, however, a remunerative speculation. In 1850 Rogers was offered the laureateship, vacated by the death of Wordsworth, but declined the appointment, which was bestowed on Tennyson. His unique collection of works of art was disposed of by auction after his death. Rogers' long life saw many literary changes, from the times of Goldsmith and Johnson to those of Thackeray and Dickens. He was a kind of English 'autocrat of the breakfast table'; famous for his anecdotes and bon-mots, and his discussions of politics and art. He was certainly a representative, though among the less prominent, of a brilliant period of English poetry; with him care and taste served for genius. A volume of his 'Table Talk' was published by Alexander Dyce (1860). Consult Clayden, 'Early Life of Samuel Rogers' (1887), and 'Rogers and His Contemporaries' (1889). The correspondence, journals, and memoirs of the earlier 19th century abound in references to him.

**Rogers, William Augustus**, American astronomer: b. Waterford, Conn., 13 Nov. 1832; d. Waterville, Maine, 1 March 1898. He was graduated from Brown University in 1857, engaged in teaching at Alfred University and in 1858 accepted its chair of mathematics and astronomy. In 1864-5 he served in the United States navy and in 1866-7 studied at Yale, but resumed his duties at Alfred after each interruption, and under his direction the observatory there was built and equipped. He was appointed assistant at the Harvard Observatory in 1870 and became assistant professor of astronomy in 1877. He accepted the chair of astronomy and physics at Colby University in 1886 and remained there until his death. His work at Harvard Observatory consisted of observing and mapping all the stars down to the 9th magnitude, in a narrow belt a trifle north of our zenith, a task which consumed 11 years in observations and 15 years for their reductions. He overcame the difficulty of finding micrometer spiderwebs suitable for his work by etching glass plates with hydrofluoric acid, an expedient which proved so successful that he furnished the government with the plates used by the expedition to observe the transit of Venus. He was an acknowledged authority on micrometrical work and established standards of measurement for practical mechanical work.

He was an active member of various scientific societies and published nearly 70 papers concerning his specialties. He also published, in the 'Annals of Harvard Observatory': 'Observations made with Meridian Circle, 1871-2'; 'Catalogue of 8,627 Stars Between 40° 50' and 50° 10' of North Declination, 1875'; 'Journal of Zone Observations During the Years 1875-1883'; etc.

**Rogers, William Barton**, American geologist and physicist: b. Philadelphia 7 Dec. 1804; d. Boston 30 May 1882. He was educated at William and Mary College, gave scientific lectures before the Maryland Institute in 1827, and in 1828 became professor of natural philosophy and chemistry in William and Mary College. From 1835 until his resignation in 1853 he was professor of natural philosophy in the University of Virginia. He added to the course mineralogy and geology; and organized and directed the Virginia geological survey until its discontinuance in 1842. During his occupancy of this chair he devoted much of his time to original researches in geology, chemistry, and physics. He was also a leading member of the Association of American Geologists and Naturalists (organized 1840), and to its 'Transactions' contributed important memoirs, including observations on the temperature of coal mines in eastern Virginia. In 1853 he removed to Boston, where he continued his researches and voluminous contributions to scientific journals of the United States and Europe, and in 1862 lectured before the Lowell Institute on 'The Application of Science to the Arts.' At the request of several citizens of Boston, he drew up in 1859 a scheme entitled 'Object and Plan of an Institute of Technology,' to include a society of arts, a museum of arts, and a school of industrial science. He then memorialized the State legislature, and at length obtained from the State a charter (1862), and the grant of a tract in the Back Bay district upon which to place the buildings of the institution. Chosen the first president of the Massachusetts Institute of Technology, he was made also professor of physics and geology, and in 1864 visited Europe for the purchase of scientific instruments and appliances. He organized the system of teaching which still in general obtains in the Institute, and whose leading feature was laboratory instruction not only in chemistry, but in physics, mechanics, and mining. He resigned his post as president in 1870, but resumed his duties from 1878 to 1881, when he was succeeded by Francis A. Walker (q.v.). In 1847 he presided at the meeting by which the Association of American Geologists and Naturalists was enlarged into the American Association for the Advancement of Science; was made president of the latter in 1875; was a corporate member of the National Academy of Sciences; became its president in 1878; and was a founder and the first president of the American Social Science Association. He has been characterized as one who had in a high degree 'the faculty of presenting the claims of science on popular interest and respect with force and lucidity.' His gifts of expression as speaker and writer were excellent. Many of his researches added materially to scientific knowledge. Among his books were

## ROGERSVILLE—ROGUE MONEY

'The Strength of Materials' (1838); 'The Elements of Mechanical Philosophy' (1852); and 'Papers on the Geology of Virginia' (1884), comprising his yearly reports in 1836-40. Consult the 'Life and Letters,' published in 1897.

**Rogersville**, rōj'ēr-z-vil, Tenn., village, county-seat of Hawkins County; on the Southern railroad; about 45 miles east-northeast of Knoxville. It is in a fertile valley, bordered by mountainous regions rich in variegated marble, and building stone, and having considerable coal. The chief manufacturing establishments are flour mills, furniture factories, and machine shops. A number of the villagers have employment in the marble quarries. The educational institutions are the McMinn Military Academy, and the Swift Memorial Institute. The latter was founded in 1848 by the Presbyterian Church. There are good public schools and two school libraries. The national bank has a capital of \$75,000. Pop. (1910) 1,582.

**Rogersville, Engagements at.** On 5 Nov. 1863 Col. Israel Garrard, with the 7th Ohio cavalry, 2d Tennessee mounted infantry, and a battery of four guns, occupied Rogersville, Tenn., camping near the town. During the day Gen. W. E. Jones, with about 2,500 Confederate cavalry, crossed the Holston River near Kingsport, made a night march by roads badly guarded, and at daybreak of the 6th surprised and captured Garrard's outposts, and advanced towards his camp, attacking and routing the 7th Ohio, Garrard and a few of his men escaping to Morristown. Jones then attacked the Tennessee regiment, which made a good resistance, but was soon surrounded and obliged to surrender. The Union loss was about 20 killed and wounded, and 650 men, four guns, two colors, 1,000 horses and mules, and 40 wagons and ambulances captured. The Confederate loss, as reported, was 10 killed and wounded. News of the disaster caused a hasty retreat of the Union forces from Jonesboro and Greeneville to Bull's Gap, where it was learned that Jones had not advanced beyond Rogersville, and the retreat ended. At the same time Jones retreated in an opposite direction to the Virginia line.

On 21 Aug. 1864 Rogersville was held by a small force of Confederate cavalry, under Col. Watkins, which was attacked at daybreak by a detachment of the 13th Tennessee cavalry, under Lieut.-Col. Ingerton. Several Confederates were killed and wounded, and Watkins, with 25 of his men, captured, the remainder escaping to Kingsport. On 8 Oct. 1864 Gen. John C. Vaughn, having driven a Union force from Kingsport, followed it to Rogersville, and attacked with his brigade, killing 10 and wounding several Union troops, and driving the remainder to Bull's Gap. On 10 December Gen. A. C. Gillem, with a Union brigade, marched from Knoxville, on the 12th drove in the pickets of Gen. Duke's brigade, and followed to Big Creek, four miles from Rogersville, where the Confederates had taken a strong position. With a part of his command Gillem made a flank movement, charged with the other part, and drove the Confederates from position and through Rogersville, in the direction of Kingsport, where they were overtaken next day and

routed, with some loss. Consult: 'Official Records' Vols. XXXI, XXXIX, and XLV.

E. A. CARMAN.

**Roget, rō-zhā', Peter Mark**, English physician: b. London 18 Jan. 1779; d. Malvern, Worcestershire, 12 Sept. 1869. He was educated at the University of Edinburgh and was appointed physician to the Manchester Infirmary in 1804. In 1808 he removed to London, where he became physician to the Northern Dispensary. He was elected a fellow of the Royal Society in 1815 and for 20 years served as its secretary. He was professor of physiology at the Royal Institute in 1833-6, and in 1837 was active in the establishment of the University of London, in the senate of which he continued a member until his death. He retired from practice in 1840 and devoted himself to literature and to mechanics, for which he had decided talent. He wrote: 'Animal and Vegetable Physiology Considered with Reference to Natural Theology' (1834); 'Physiology and Pneurology' (1838); and the famous 'Thesaurus of English Words and Phrases' (1852).

**Roggeveld (rōg'gē-vēld) Mountains**, in Africa, in the southwestern division of Cape Colony, running northwest to southeast with an average height of 5,000 feet. They form a western continuation of the Nieuwveld Mountains.

**Rogier, rō-zhā', Charles** Latour, Belgian statesman: b. St. Quentin 17 Aug. 1800; d. Brussels 27 May 1885. He was educated at the University of Liège and at the outbreak of the Belgian revolution in September 1830 became a revolutionary leader in Brussels. On 24 September he was made president of the administrative commission and later went as a delegate of the provisional government to Antwerp. After an armistice had been arranged with Holland, he exercised absolute power in the reorganization of the administration of the city. He represented Liège in the National Congress, voted to establish a hereditary monarchy, and proposed the adoption of the elective second chamber. He became governor of the province of Antwerp in 1831 and the next year minister of the interior. He retired in 1834 after having carried a law providing for the establishment in Belgium of the first railway in Europe. From 1834 to 1840 he was again governor of Antwerp; and leader of the Liberal party in opposition 1841-7. He became prime minister and minister of the interior in 1847 and by his energy and foresight Belgium escaped the revolutionary crisis that involved Europe in 1848. In 1850 he organized secondary education under control of the state; but retired from office in 1852. Again becoming prime minister in 1857 one of the first acts of his ministry was the fortification of Antwerp. In 1861 he became minister of foreign affairs and succeeded in freeing the navigation of the Scheldt, which fact contributed to make Antwerp one of the important ports of Europe. He retired from ministerial office in 1868, though he sat for Tournai until his death.

**Rogue Money**, the popular name for an assessment formerly levied on every county in Scotland "for defraying the charges of apprehending criminals, or subsisting them when apprehended, and of carrying on prosecutions against them." This tax was first imposed by

## ROGUE RIVER INDIANS—ROJAS Y ZORRILLA

a statute of George I., on the assertion that criminals were in the habit of escaping punishment for lack of the funds necessary to bring them to justice. The freeholders in each shire were directed to fix the assessment at any of the head courts yearly, and to appoint collectors. By an act of Victoria rogue money in the shires was abolished, and in lieu thereof power was conferred on the Commissioners of Supply to levy by rate a "County General Assessment."

**Rogue** (rög) **River Indians**, the name applied to a number of Indian tribes on Rogue River, southwestern Oregon, most of which belonged to the Athapascan stock, but the members of the Takilman stock were also included. They were not friendly to the early settlers, and in 1853, with neighboring tribes, finally resented the continued encroachments on their lands by conducting a succession of massacres and outrages which continued until 1856, when they were compelled to submit to American troops and sent to Grande Ronde Reservation, where they remained until the spring of 1857 when they were finally established on Siletz Reservation. Here, with five other tribes, they now number 453.

**Rohan, Henri de, dh-ré dé rô-ân**, Duke of, French general: b. Castle of Blain, Brittany, 21 Aug. 1579; d. Königsfeld 13 April 1638. In his 16th year he joined the court of Henry IV., whose childless marriage led him to entertain the hope that, as a very near relative, he might one day succeed him in Navarre, but in 1610 the assassination of the king dashed all his hopes. The opposing parties again flew to arms and Rohan placed himself at the head of the Calvinists. But Louis XIII. and Richelieu, the all-powerful minister, annihilated the political existence of the Huguenots. Rohan then withdrew from his native land, and in exile wrote 'Mémoires sur les Choses advenues en France depuis la Mort de Henri IV.' (1630). In the wars of Venice against Austria he commanded the troops of the republic till the Peace of Cherasco in 1631. Later he went to Geneva, where he composed his 'Mémoires et Lettres sur la Guerre de la Valteline' (1638). In Germany the Roman Catholic league had made war against the Protestants, and Rohan in 1638 joined Bernard of Weimar, then commanding the Protestant army on the Rhine. He was wounded at the battle of Rheinfelden, 28 Feb. 1638, and his death followed shortly afterward. Besides the works mentioned above he wrote 'De l'Intérêt des Princes et États de la Chrétienté' (1638).

**Rohan, Louis René Edouard**, PRINCE DE. See DIAMOND NECKLACE.

**Rohilkhand, rô-hîl-kând' or -kând'**, or **Rohilcund**, India, a division of the United Provinces of Agra and Oudh, bounded north by the Himalayas, separating it from Kumaon, west and southwest by the Ganges, and east and southeast by Oudh; area, 10,885 square miles. The surface is a plain, with a gradual slope south, in which direction its principal streams, Ramganga, Deoha, and others, flow. Its north frontier is occupied by an extensive forest; elsewhere palms, the sugarcane, cotton, and the finer fruits of the temperate zone flourish. It

takes its name from the Rohillas, an Afghan tribe, who gained possession early in the 18th century. The division is subdivided into the districts Bijnur, Muradabad, Budaon, Bareilly, Terai, and Shahjahanpur. It encloses the native principality of Rampur. Pop. of division, 5,343,674.

**Rohlfs, rôlfs**, Anna Katharine Green, American novelist: b. Brooklyn, N. Y., 11 Nov. 1846. She was graduated from Ripley College (Poultney, Vt.), in 1867, and in 1884 was married to Charles Rohlfs. In 1878 she won a great success with 'The Leavenworth Case,' a detective story with an ingenious and well-elaborated plot. With the exception of a dramatic poem, 'The Defence of the Bride' (1882), and a drama, 'Rufai's Daughter' (1887), her other works follow similar lines. Among the titles are: 'A Strange Disappearance' (1879); 'The Mill Mystery' (1886); '7 to 12' (1887); 'A Matter of Millions' (1890); 'The Woman in the Alcove' (1906); 'That Affair Next Door' (1897); 'The Circular Study'; 'The Filigree Ball' (1903); 'The Millionaire Baby'; 'The House in the Mist' (1904).

**Rohlfs, Friedrich Gerhard**, German African traveler: b. Vegesack, Germany, 14 April 1831; d. Godesburg, Prussia, 3 June 1896. He was educated at Heidelberg and Göttingen and in 1855-60 served as a surgeon in the French army at Algiers. He traveled through Morocco in 1860 and in 1862 explored the Taflet Oasis. He traveled in North Africa in 1863 and in 1865, joined the English expedition to Abyssinia in 1867, and in 1868 traveled in Cyrenaica. He conducted an expedition through the Libyan Desert in 1873-4, traveled in North America in 1875-6, and in 1878 again visited Africa, penetrating to the Kufra Oasis. He traveled in Abyssinia in 1880 and in 1884-5 acted as German consul at Zanzibar. He wrote: 'Journey through Morocco' (1869); 'Across Africa' (1874-5); 'My Mission to Abyssinia' (1883); 'What News from Africa' (1887); etc.

**Rojas y Zorrilla, rô-häs é thör-rêl'yä**, Francisco de, Spanish dramatist: b. Toledo, Spain, 4 Oct. 1607; d. about 1680. Information concerning his life is of a fragmentary character and he is frequently confused with several other persons of the same name. He seems to have studied at the universities of Toledo and Salamanca and his work had become famous by 1632, as Montalván mentions him in high terms in his 'Para Todos' of that year. There was a rumor that he had been assassinated in 1638 but it was clearly unfounded, as in 1644 he was honored with the mantle of the Order of Santiago, an evidence of favor at court. He was author of numerous plays and sacred pieces, but took no pains to preserve his works and many of them have been lost, though he did publish two 'Parts' of his dramas (1640-5) and announced a third which never appeared. Among the best of his remaining works are: 'Del Rey abajo ninguno'; 'Entre bobos anda el juego'; 'Lo que son mujeres'; 'Casarse por vengarse.' No complete edition of his remaining works has been published, but an excellent selection is given in Rivadeneyra's 'Biblioteca de Autores Españoles' (Vol. LIV, 1866).

**Rokitansky, rō-kā-tā'n'skē, Karl, BARON** von, Bohemian anatomist: b. Königgrätz 19 Feb. 1804; d. Vienna 23 July 1878. He studied at Prague and Vienna; became professor of pathological anatomy at the University of Vienna in 1834, and continued there until 1875. His great work, 'Handbuch der pathologischen Anatomie' (1843-6), stands as the foundation of the science of pathological anatomy. It was translated by order of the Sydenham Society in 1849-52. In 1869 Rokitansky became president of the Austrian Academy of Sciences.

**Roland, Jean Marie de la Platière, zhān mā-rē dé là plā-tē-ār rō-lān, French patriot:** b. Thiry (Beaujolais) 18 Feb. 1734; d. Rouen 15 Nov. 1793. From a humble position in the mercantile world, he rose to eminence in the city of Amiens, in which he held the office of inspector of manufactures. His interests, however, were not in trade, and his views upon political economy and the great problems of government brought him into the ranks of the philosophers of his day. In 1780 he married Manon Jeanne Philpon, whose share in the Revolution was even greater than his own. At the outbreak of the Revolution he joined the Moderate Republican party, during whose brief rule he was made minister of the interior. This position he held from March until June 1792, when the Girondists were forced to retire. After the conflict in Paris 10 August, Roland was recalled, but the Jacobin spirit was too strong, and he was forced to flee. Upon hearing of the death of his wife he took his own life. Consult Lamartine, 'Histoire des Girondins' (1847; English translation by Ryde).

**Roland, Manon Jeanne Philpon, wife of Jean Marie Roland (q.v.):** b. Paris 17 March 1754; d. there 9 Nov. 1793. With a mind bent upon interests far beyond her years from earliest childhood. Mademoiselle Philpon, the daughter of a Paris engraver, developed at 19 remarkable talents, and at 24 into a woman of great brilliancy of intellect, a disciple of Rousseau, the emancipation of the common people her creed, and their deliverers, the philosophers and patriots of France, her friends and counselors. In 1779 she was married to M. Roland, with whose political fortunes her life was thenceforth bound. Her faith in the outcome of the Revolution was that of a devotee, her enthusiasm the inspiration of a great party. At first the friends and confidants of Robespierre and those who were afterward leaders of the Jacobin element, the Rolands became the defenders of the more moderate republican idea, and were among the greatest martyrs to this cause. On the fall of the Girondists in the summer of 1793, Madame Roland was arrested, and on the 9th of November was guillotined. During her imprisonment she wrote her famous 'Mémoires,' which were afterward published, together with her correspondence with the other leaders of the French Revolution. Consult: Lamartine, 'Histoire des Girondins,' English translation by Ryde (1849); 'Correspondence de Madame Roland,' edited by C. Perroud (1901); Tarbell, 'Life of Madame Roland' (1896).

**Roland, rō'lānd (Italian, ORLANDO), hero** of romance and one of the paladins of Charle-

magne, of whom he is represented as the nephew. His character is that of a brave, unsuspicious, and loyal warrior, but somewhat simple in his disposition. According to the 'Song of Roland' (11th century) which forms part of the 'Chansons de Geste,' Charlemagne, after a six years' stay in Spain, resolved to return home. By the advice of Roland the emperor sent Ganelon to Saragossa to receive the homage of the Saracen king Marsilia. This mission had been fatal to all who had been formerly sent on it, and Ganelon, to revenge himself on Roland, betrayed to Marsilius the line of march of the Christian army. Marsilius collects an immense host, allows Charlemagne to cross the Pyrenees with the main body of his force, and falls upon the rear-guard commanded by Roland (776). A desperate struggle ensued; 100,000 infidels fell, and Roland had only 50 remaining of the 20,000 warriors whom he had led into the narrow pass of Roncesvalles (Roncevaux). Another pagan army hastens up. Seeing himself now fairly overpowered Roland at last sounds his enchanted horn, which is heard beyond the mountains by the emperor. The traitor Ganelon, however, deceives Charlemagne with the assurance that Roland is only engaged on a deer hunt. Thrice the sound of the ivory horn is heard and unanswered, but another blast, the violence of which cracked Roland's temples, alarmed the emperor for the safety of his favorite warrior. He hurries up to his assistance, but it is too late; Roland, wounded in many places, has dragged himself to die at the foot of a tree, has sung his death song and thrown down his enchanted sword, Durandal, and the ivory horn, and covered them with his body. Nothing remains but to avenge the death of the hero, and this Charlemagne does in a series of bloody victories, with the narration of which the poem closes. The poems of Pulci, 'Morgante Maggioro'; of Boiardo, 'Orlando Innamorato'; and Ariosto, 'Orlando Furioso,' relate to Roland and his exploits. Consult: Einarhard, 'Vita Caroli Magni'; Turpin, 'De Vita Caroli Magni et Rolandi'; Schmidt, 'Ueber die italienischen Heldengeschichten aus dem Sagenkreis Karls des Grossen' (1820).

**Rolfe, rōlf, William James, American Shakespearean scholar:** b. Newburyport, Mass., 10 Dec. 1827; d. 7 July 1910. Educated at Amherst, and after teaching in Wrentham, Mass., became master of the high school, Dorchester, Mass., in 1852. In 1857 he was master of the high school at Lawrence, Mass., in 1861 of the high school at Salem, Mass., and from 1866 to 1868 of the high school at Cambridge, Mass., resigning in the year last named to devote himself to literary pursuits. His Shakespearean labors began in 1867 with his editorship (with J. H. Hanson) of Craik's 'English of Shakespeare.' In 1870 he issued an annotated edition of 'The Merchant of Venice' and followed this with other annotated plays till in 1883 a complete edition of Shakespeare had appeared in 40 volumes. This is sometimes styled 'The Friendly Edition,' a name first suggested by Mary Cowden-Clarke (q.v.). He has also edited 'Select Poems of Goldsmith' (1875); Gray (1876); Browning (1887); and Wordsworth (1889); a complete edition of Scott

## ROLL—ROLLIN

(1887); and of Tennyson (1895-8), and other works, and is the author of 'Satchel Guide to Europe,' revised yearly (1872-1903); 'Shakespeare the Boy' (1896); 'Life of Shakespeare' (1902). He lectured much upon Shakespeare and literature in general and in his editions of Shakespeare and other poets he admirably preserved the balance between textual and literary criticism.

**Roll, rôl, Alfred Philippe,** French painter: b. Paris 10 March 1847. From being a designer of patterns and decorations of various sorts he passed to the Ecole des Beaux Arts at Paris, where he was much attracted to the work of Jerome and Bonnat. The influence of both these teachers is traceable in his pictures, especially that of Bonnat in the duskiness of coloring which prevails in his 'Scenes from the Flood at Toulouse in June 1877,' a picture which gained a medal of the first class, and is now in the Havre Museum. In succeeding pictures he developed a passion for naturalism of the most uncompromising character, and in his 'Feast of Silenus' (1878) (in the Museum of Ghent), and still more in the 'Strike of the Colliers' (1880), now in the gallery of Valenciennes, and 'Labor' (a representation of masons, bricklayers, and carpenters at work on a building), this tendency is conspicuous. These are all blazing sunlight pictures, as if executed *en plein air*, and in like style are his subsequent works whether portraits, genre-groups, landscapes, or marines. They are solidly painted with a matter-of-fact air of reality which is very striking. Among his later works is a canvas crowded with figures, 'The Centennial Jubilee of the Revolution of 1789' (1893).

**Rolla, Alessandro,** Italian violinist and composer: b. Pavia 22 April 1757; d. Milan 15 Sept. 1841. He was active for many years as musical director at La Scala theatre and teacher in the Conservatory in Milan, and published several quartet and solo pieces as well for the violin as for the bass viol, which for essential purity of composition and perfection of form stand preeminently superior to similar works of his day.

**Rolla, rôl's, Mo.,** city, county-seat of Phelps County; on the Saint Louis and S. F. railroad; about 48 miles south-southeast of Jefferson City, and 110 miles southwest of Saint Louis. It is in an agricultural and iron mining region. Its chief industrial establishments are smelting furnaces, foundries, machine shops, flour and grist mills. It is the seat of the Missouri School of Mines and Metallurgy, a department of the Missouri State University (q.v.), organized in 1871. Pop. (1890) 1,398; (1900) 1,600; (1910) 1,791.

**Roller,** a tropical bird of the genus *Coracias*, forming the type of the family *Coraciidae*. These birds are generally of small size, and frequently exhibit brilliant colors in their plumage, and are confined in their distribution to the eastern hemisphere. The food consists partly of insects and partly of nuts and fruits. The common roller (*Coracias garrula*) is found in Africa, whence it migrates in summer northward into Europe. In size the roller equals the common jay. The back is of a light brown color. The head is bluish-green, as also are the neck and lower surfaces. The lesser coverts of the

wings are bright blue; the tail-feathers blue, with a greenish lustre. The voice is noisy and harsh. In habits these birds are shy, and frequent forest depths and secluded spots. The four pure white eggs are frequently deposited in the boles of trees or in holes in river banks. The genus *Eurystomus* is nearly similar to *Coracias*, but occupies tropical Africa. Both genera include several distinct species. Consult Evans, 'Birds' (1900).

**Roller Skate,** a skate patented in France as early as 1819. Since that time scarcely a year has passed without the recording of some improvement in wheel skates. Plimpton's improvement consisted in so gearing two pairs of wheels that they would "cramp" when the foot-plate was canted to either side, and thus cause the skate to move on a curved line. Several years elapsed before the value of the invention was generally recognized; but in the meantime the inventor was busy making improvements and taking out other patents and in 1874 had brought the skate practically to its present condition. This device of "cramping" the wheels secured the initial success of roller skating. The earlier inventions were crude affairs compared with the modern appliances; the present roller skate combines strength, lightness, and ease of action in a marked degree. About 1864 the mania for roller skating appeared in England; but in 1866 the "rinking" fever broke out in Australia, and spread thence to England and the United States. Since that time the craze has appeared at intervals only to again die out. The most recent of these arose in 1884-5 in the United States, but soon shared the fate of its predecessors. The most recent form has only two wheels, set one behind the other, and resembling the ice skate in its form and action.

**Rollin, rô-lîn, Ambrose Lucien,** West Indian historian: b. Trois Rivières, Guadeloupe, 1692; d. Point à Pitre, Guadeloupe, 1749. He was appointed deputy-lieutenant of the colony in 1725, an office which he occupied until his death, and devoted himself in his leisure to researches upon the Caribes and other Indian tribes. His works show remarkable care and ability and are still accepted as authoritative. They include: 'Histoire des Indiens' (1739); 'Histoire et Description des Caraïbes, leur Condition avant la Conquête' (1734); 'Les Incas du Pérou et la Conquête Espagnole' (1748); etc.

**Rollin, Charles,** French historian: b. Paris 30 Jan. 1661; d. there 14 Sept. 1741. He studied theology at the Sorbonne, but did not take orders. In 1688 he obtained the chair of eloquence in the Collège de France, of which he became rector in 1694, and he there revived the study of Greek language. In 1696 he was chosen coadjutor or head of the Collège de Beauvais. Displaced in consequence of his connection with the Jansenists, he was reinstated in 1720. His productions are 'Traité des Etudes' (1726-31); 'Histoire Ancienne' (1730 and 1738), his best known work; and 'Histoire Romaine' (1738-48) to the war against the Cimbri (completed by Crevier and others). Rollin's writings are distinguished for purity and elegance of style, but are diffuse and prolix, and his historical works are deficient in critical sagacity. There is an edition of his works in 30 vols. (1827), with notes on the historical parts by Guizot. His 'Ancient His-

tory' has been often reprinted in English, but is now quite out of date.

**Rollin, Ladru.** See **LADRU-ROLLIN**.

**Rolling Mills** are machines employed to convert masses of metal into bars or plates, and consist of a series of rollers in pairs, variously arranged, between which the metal is passed and receives successive reductions in thickness and a consequent increase in length or breadth, as the case may be. The rollers are made of steel, and are mounted on massive frames capable of withstanding enormous strains. They have plain or grooved surfaces according to the purposes for which they are employed, and are driven by powerful horizontal reversing steam-engines, by cog-wheel connections and axle gearing. Of the many purposes for which they are employed, perhaps the most important is the manufacture of rails, bridge work and other structural shapes, pipes or tubes, wire, and plates of various kinds such as armor plate, boiler plate, etc. (See **PIPE, MANUFACTURE OF**.) In the manufacture of rails, the ingot of cast metal is placed in the soaking pit and heated to a white heat. It is then taken to the blooming mill and passed through the blooming rolls seven times and reduced to a bar of a section 9 inches square, and 15 feet long which is subsequently sheared into two or three pieces, according to the length of the desired rail. These pieces called "blooms" are then heated in the bloom furnaces from which they are taken to the rail mill, which consists of a series of grooved rollers arranged in three sets—the roughing rolls, the intermediate rolls, and the finishing rolls. These rolls are placed one beyond the other and extend over an interval of about 900 feet. The hot blooms are passed through them successively. Through the roughing mill the bloom is passed five times and reduced approximately to the section of the desired rail. It is then passed through the intermediate rolls five times and brought still closer to the desired section. It is now placed upon a cooling table for a period of time ranging from 45 to 90 seconds, depending upon the weight per pound of the rail, and then passed through the finishing rolls and brought to the exact section required. After leaving the finishing rolls the rails are cut up into lengths of 30 or 60 feet, as required, then passed through the cambering rolls where they receive sufficient camber to insure of their remaining true and straight when cooled. Rail rolling mills have a capacity of turning out from 7,000 to 8,000 rails per day, requiring about 3,000 tons of metal. (See **RAILS, MANUFACTURE OF**.) In the manufacture of bridge and other structural shapes, a brief description of the rolling mills of the Pencoyd Iron Works, Pencoyd, Pa., will serve to indicate their enormous capacity. The output of their open-hearth department amounts to 46,000 tons of ingots per week. This mass of metal is converted into finished shapes by a plant of five mills—a 23-inch, three-high roll train, for rolling shapes; a 12-inch, three-high roll train, for rolling angle and T irons; a 28-inch, two-high reversing roughing mill; a 36-inch, two-high preparing mill; and a 23-inch, three-high finishing mill, each of which is driven by 30 x 36-inch double reversing engines geared directly to the mills. For use of rolling mills in wire-making, see **WIRE, MANUFACTURE OF**.

**Rollins, rôl'ins, Frank West,** American politician: b. Concord, N. H., 24 Feb. 1860. He was graduated from the Massachusetts Institute of Technology in 1881 and later attended the Harvard Law School. After a brief practice of the law, he became a banker in Boston. In 1890 he was elected to the New Hampshire Senate, and in 1898 was elected governor of that State. In this capacity he served two years. The idea of "Old Home Week," established in New Hampshire during his administration, and adopted by many of the older States, originated with Governor Rollins. He has published 'The Ring in the Cliff' (1877); 'Break o' Day Tales' (1895); 'The Lady of the Violets' (1898); 'Old Home Week Speeches' (1900); etc.

**Rollins College,** located at Winter Park, Fla.; established in 1883. It is not under direct denominational control, but is closely affiliated with the Congregationalists. It has a collegiate and preparatory department, the former conferring the degree of bachelor of arts. It is co-educational, and the number of women in attendance usually nearly equals the number of men. The grounds and buildings in 1910 were valued at about \$200,000, the library contained 8,000 volumes; the annual income was over \$60,000. The students numbered 200 in both departments, and the faculty 20.

**Rollo, rôl'ô,** Norwegian conqueror of Normandy: d. 930. According to tradition he was named "Walking Rolf" (Ganger Rolf), because no steed could carry him. He fought for several years in France, and finally made peace in 912, receiving from Charles the Simple for himself and his freebooting followers a tract along the Seine between the Eure and Epte. He became a Christian, was baptized at Rouen, and took the title Duke Robert. See **NORMANS**.

**Romagnoli, rô-mân-yô'sê, Giovanni Domenico,** Italian jurist and philosopher: b. Salso Maggiore, Italy, 13 Dec. 1761; d. Corfu 8 June 1835. He was educated at Pavia and established himself as an advocate at Trent. He was appointed professor of law at Parma in 1803 and in 1806 went to Milan to assist in preparing a code of penal procedure which was later adopted. A chair of law was established expressly for him at Milan, but after the downfall of Napoleon he lost his position. He continued to lecture until 1817 and in 1818 was tried for treason but acquitted. He subsequently supported himself by giving private lessons and continued in abject poverty until his death. Among his works are: 'La genesi del diritto penale' (1791); 'Introduzione allo studio del diritto pubblico universale' (2 vols. 1805); etc. Complete editions of his works were published in 19 volumes (1832-5) and in 15 volumes (1836-45).

**Roma'ic.** See **GREEK, Modern Greek Language and Literature**.

**Romaika (rô-mâ'î-kâ) Dance.** See **PYRREIC DANCE**.

**Romaine, rô-mân', William,** English Anglican divine: b. Hartlepool, England, 25 Sept. 1714; d. London 26 July 1795. He was educated at Oxford, held several small curacies prior to 1748 when he went to London to hold a lectureship at the united parishes of St. George's, Botolph Lane and St. Botolph's, Billingsgate. In

## ROMAN AND GREEK GODS — ROMAN CATACOMBS

1749 he became attached to St. Dunstan's—in the West and the next year became morning preacher at St. George's, Hanover Square. He was a follower of Whitefield, an ardent evangelical, and suffered much persecution in and out of the church for his views, and on account of the congregations of the poor that he assembled. As a consequence he lost his appointments and held others but for a brief period until 1764, when he was inducted to St. Ann's Blackfriars, and was elected by the parishioners to St. Andrew of the Wardrobe. This election, though disputed, was confirmed by the court of chancery and he held the pulpit until his death. He published: 'The Life of Faith' (1763); 'The Walk of Faith' (1771); 'The Triumph of Faith' (1794).

**Roman and Greek Gods.** The following are among the more prominent gods in Roman and Greek mythology:

| Gods                       | Greek       | Roman       |
|----------------------------|-------------|-------------|
| King of Gods.....          | Zeus.       | Jupiter.    |
| God of Water.....          | Poseidon.   | Neptune.    |
| God of the Lower Regions.  | Pluto.      | Pluto.      |
| Messenger of the Gods..... | Hermes.     | Mercury.    |
| God of War.....            | Ares.       | Mars.       |
| The Gods' Smith.....       | Hephestos.  | Vulcan.     |
| God of Light.....          | Apollo.     | Apollo.     |
| Goddess of Hunting.....    | Artemis.    | Diana.      |
| Goddess of Wisdom.....     | Athene.     | Minerva.    |
| Queen of Heaven.....       | Hera.       | Juno.       |
| Goddess of Tillage.....    | Demeter.    | Ceres.      |
| Goddess of the Hearth..... | Hestia.     | Vesta.      |
| Goddess of Beauty.....     | Aphrodite.  | Venus.      |
| God of Wine.....           | Dionysos.   | Bacchus.    |
| God of Love.....           | Eros.       | Cupid.      |
| God of Time.....           | Chronos.    | Saturn.     |
| Wife of Chronos.....       | Rhea.       | Cybele.     |
| Queen of Hades.....        | Persephone. | Proserpina. |
| Goddess of the Rainbows..  | Iris.       | Iris.       |
| Cup-bearer to the Gods...  | Hebe.       | Hebe.       |

**Roman Catacombs.** The "Catacombs of Rome" is the name given to the underground cemeteries, in which were laid to rest the Christians of the Eternal City during the first four centuries. The word itself seems to be a hybrid from the Greek *σῆμα* and the Latin *cum-bere*, and signifies "next the sepulchres." It first came into use at the end of the 3d century as a topographical term for a point of the Appian Way. In the course of time it was applied to the adjoining cemetery of Saint Sebastian, and in the Middle Ages when the other cemeteries were forgotten, it became a general designation for all the early Christian burial-places at Rome. It was a word unknown, however, to the first followers of Christ, who called the sepulchres of the saints, cemeteries, "places of sleep," owing to their faith in the Resurrection. There are some 32 of these larger early Christian cemeteries beyond the Aurelian wall, bordering the ancient Roman roads and encircling the city of the living with a silent city of the dead. The most important are the Catacombs of Priscilla on the Via

Salaria, of Calixtus on the Via Appia, of Domitilla on the Ardeatina, and the Ostriniano on the Via Nomentana. In this Roma Sotterranea there are some 550 miles of underground corridors, honeycombing the soil of the deserted Campagna, and running like streets in all directions and at every angle, now near the surface and again descending to the depth of 75 feet, expanding here into a room and there into a crypt or chapel, along whose sides the faithful were buried in rows one above the other, like the shelves of a shop, or the bunks of a vessel. The corridors average about three feet in width and six feet in height, and were dug generally in three or four levels, ranging from 30 to 50 feet below the surface of the soil. The niches, called *loci*, or *loculi*, which contained the bodies, were closed by a marble slab or a series of tiles, on which was frequently carved some inscription. To understand the origin of the Catacombs, it is necessary to keep before our minds, (1) the funeral customs and laws of Imperial Rome; (2) the early Christian mode of burial; and (3) the nature of the soil out of which sprung the famous seven hills. (1) The ancient Romans had a great reverence for their dead. *Religiosum locum unus quisque suo voluntate facit, dum moritum infert in loco suo.* Wherever a body rested became *terra sancta*, sacred soil, subject to the authority of the pagan pontiffs. Hence burials were forbidden inside the walls, and the ways leading out of the city were lined from the first to the third milestone with the mausolea, whose richness was one of the glories of the Imperial City, as their ruins are one of the beauties of modern Rome. The pagan mausoleum consisted of three parts, the monument proper, the area or lot of ground, and the underground vault in which the ashes were placed in dove-cot niches, known as *columbaria*. These burial plots with their magnificent monuments were owned by burial societies as well as by families, and were fully protected by the law. The Christians likewise, either singly or collectively, erected their mausolea along the highways beyond the walls, and this property, even in times of persecution, was safeguarded by the majesty of Roman law. Hence it often happened that while the law spilled the blood, it spared the body of the Christian. The opinion sometime current that the bodies of the martyrs were buried by stealth, and that the pagan authorities were ignorant of the existence and extent of the Catacombs, is altogether unfounded. The Catacombs were registered under and recognized by the law. They enjoyed the privilege of sacrosanct soil. Indeed many of the bodies were interred in surface cemeteries as to-day. (2) The first faithful originated no special mode of burial. They generally followed the customs of the people among whom they lived. They adopted the Jewish practice of interring, instead of the Roman method of cremating, on account of their belief in the resurrection of the flesh. The sepulchre hewn in the rock, where the body of Christ was laid, was the resting place too of the Christian body. This was first wrapped in a tunic or winding sheet previously coated with a preparation of plaster, was covered with perfumes and flowers, and placed in one of

the niches cut out of the subterranean crypt or along the corridor. In the case of the martyrs or wealthier converts the bodies were laid sometimes in a marble sarcophagus or in an arched grave hewn out of the rock, termed *arcosolium*, and called *bisomus* or *trisomus*; according to number of bodies it contained. (3) The soil of the Roman Campagna is of volcanic origin, and consists of three distinct sorts of tufa; (1) the lithoid tufa or peperino, a hard building stone; (2) the fine pozzalana sand used in making the Roman cement; (3) a granular tufa, of no commercial value. However this granular tufa was readily worked, and it is precisely in this strata that we find the Catacombs. The workmen followed these veins in excavating, thence the apparent confusion of the courses and distance of the depths. It was thought at one time that the Catacombs, like the *arenaria*, were excavated for building purposes, but modern research has shown that they are of distinctively Christian origin, and have nothing in common with the *arenaria* either in mode or material of construction.

**Origin.**—The genesis of the grave among the faithful at Rome was something like this. The wealthier Christians owned their burial lots along the public roads leading out of the city. They had their monument fronting the way, marked with the name of the family. Thus for instance was the case with "*Sepulchrum Flavium*" on the Ardeatine Way. The crypt beneath instead of being fashioned into a columbarium, had the graves cut out of the soil. At first this crypt was placed at the disposal of the brethren of the *Ecclesia Fratrum*, and as the number of burials increased, the crypt was gradually extended under the entire surface of the lot. Thus the Catacombs in the first and second centuries were little more than the private burial vaults of the wealthier Christian converts. These original centres of excavation have been recognized in many cases, as for instance, the crypt of Lucina in Calixtus, the Greek Chapel in Priscilla, and the *Spelunca magna* in Prætextatus. At the beginning of the 3d century, the cemeteries passed from private to Pontifical control. About the year 197, Zephyrinus appointed the deacon Calixtus to take them in charge, and the latter has bequeathed his name to the best known of them, which became the official burying place of the Bishops of Rome in the 3d century, and contains the famous papal crypt. Henceforth the Catacombs were owned and administered by the Church. Each one of the 25 parishes in which Ecclesiastical Rome was divided in the 3d and 4th centuries had, roughly speaking, its corresponding cemetery. The identification of the tituli and the cemeteries has been established in a number of instances. With the increasing number of the faithful were formed burial societies among the brethren, which, like the pagan societies, provided by the payment of dues for the benefits of burial to deceased members. They owned their own lots, had their own houses built above the ground, in which they met to celebrate their agape and funeral feasts. Hence there was nothing incongruous in the Christians assembling at the Catacombs on stated occasions to

keep the anniversary feasts of their martyrs. Similar celebrations were held by the pagans themselves, and there is a striking resemblance between the liturgy of these pagan funeral feasts and the language of the Roman martyrology. The inviolability of the cemeteries was undisturbed even in times of persecution, save by Valerian, in 258, and Diocletian, in 303. The part played by these burial societies in the Church is still in dispute. De Rossi has advanced the theory that the Church in the 3d century owned its property as a burial society, as *Ecclesia Fratrum* or *Ecclesia Cultorum Verbi*. Duchesne, however, contends that even in period of persecution, the Church was recognized as a religious society, capable of holding property. The work of excavating was under the care of a distinct class, called *fossores* or diggers. They were regarded as an inferior sort of clergy, and many of the rude inscriptions were made by them.

**The Constantine Period.**—It has often been said that the victory of Constantine brought the Church from the Catacombs to the Cathedral. The reverse is literally true. It was precisely in the era of peace, that the Church betook itself to the Catacombs, and that they attained their largest growth and grandeur. Everyone wished to be buried close to the martyrs of Christ. *Quod multi cupiunt et rari accipiunt*, we read in an inscription of the year 381, of one who had obtained burial near the sepulchre of the saints. The crypts of the martyrs were changed into triumphal halls of fame. They were decorated with the choicest of marbles from the wealth of the Imperial City. New corridors and entrances were cut, the old ones were joined together. Metrical hymns of praise were placed above the graves of the chief martyrs, especially by Pope Damasus. Lights were kept burning before their shrines, and thither the devout of the city were continually flocking to implore the intercession of the saints or to honor their memory. Even the great Constantine basilicas of Saint Peter on the Vatican, Saint Lawrence on the Labicana, Saint Paul on the Ostian, Saint Agnes on the Nomentana, were but triumphal canopies erected over the tombs of these Christian heroes. Toward the end of the 4th century the custom of burying in the surface cemeteries began to prevail, and after the sack of Rome by Alaric, in 410, interment in the Catacombs ceased altogether.

**Period of Decline.**—In the succeeding centuries they were chiefly centres of devotion and terms of pious pilgrimages from the North. The itineraries of these pilgrimages from England and Germany, some of which have been preserved, were veritable Ariadne-clues in the rediscovery of these buried labyrinths. For some time the Popes of Rome, notably Vigilius (537-555), John III. (561-574), and Honorius I. (625-638), kept the shrines in a state of repair; but after the ravages wrought in the Catacombs by the invading Lombards, Paul I. in 757 and Paschal I. in 817, translated the relics of the martyrs to churches within the walls. Deprived of the treasures which had attracted visitors, they rapidly fell into decay. With the exception of the Catacomb of Saint Valentinian on the Flaminian, and Saint Sebastian on

## ROMAN CATACOMBS

the Appian way, their very existence passed out of the minds of men in the Middle Ages.

**Rediscovery and Research.**—In 1587 some workmen, excavating on the Via Salaria, chanced upon a Catacomb corridor, rich in paintings and inscriptions. The interest aroused by this discovery has never since died out. Antonio Bosio (1576-1614), the Columbus of the Catacombs, devoted his life to their exploration. His *'Roma Sotterranea'* is the first classic on the Catacombs. The researches made by Boldetti and Battari and others in the 18th century were mainly in the interest of controversy. To the Jesuit, Fr. Marchi, belongs the glory of having inaugurated, in 1841, a strictly scientific study of these early monuments and memorials, and the still greater glory of being the Master of Giovanni Battista de Rossi (q.v.), the father and founder of the science of Christian archaeology. By his genius and labors he explored and excavated the buried crypts and corridors of the Catacombs, established their identity and called them by name. From broken stone and damaged fresco and forgotten tomb, he gathered together the materials of a monumental *Encyclopædia Romana*, a storehouse of the treasures of early Christian belief and behavior.

**Paintings.**—In regard to the many paintings found in the Catacombs, it may be said in general, that the history of the decline of Classic is that of the beginning of Christian art. In fact nearly all the examples extant of Roman paintings in the 2d, 3d, and 4th centuries are in the Catacombs. They show us that the Church baptized the art as well as the language of the Græco-Roman world. While the themes treated for the most part have a direct reference to the grave and beyond, they still illustrate a large part of the creed of the early church. The Catacomb frescoes belong to three distinct periods. In the first and beginning of 2d century, there was properly speaking no Christian art. The methods and motifs of the pagan painter, such as abound at Pompeii, vines, garlands, flowers, fishes, fruits, birds, cupids, etc., appear likewise in the Catacombs. However even among these designs, those that were capable of symbolizing some Christian truth, as the vine, peacock, dove, and fish, predominate. In the 2d and 3d centuries, as the cemeteries pass from private to public control, a series of paintings distinctly Christian begin to appear. They are symbolical in meaning and similar in execution.

In the third epoch which corresponds to the time of peace, the pictures tend to become more and more realistic, until they are petrified in the 5th and following centuries in the rigid forms of Byzantine art.

**The Biblical Cycle.**—A remarkable parallel between the prayers of the Roman Breviary for the commendation of the soul in the hour of death and the Biblical Cycle of cemeterial paintings, was first pointed out by Le Blant. This correspondence is so exact as to leave little doubt that these paintings derive their inspiration from the funeral liturgies of the Church. The deliverance of Noah in the flood, of Isaac from the sacrificing hand of his father, of Daniel from the lions' den, of the three children from the fiery furnace, of Susannah

from her false accusers, of Jonah from the whale, are the ever repeated themes, and they all correspond to the liturgical prayers for the dying. The raising of Lazarus completes the Biblical Cycle, and this scene is the gospel for the Requiem Mass. Of this series Jonas and Lazarus are most frequently depicted. The designs are evidently symbolic. A man standing in a chest serves to recall Noah and the ark; the story of Jonah is often told in three scenes; the casting from the ship, the vomiting forth from the dragon fish, and the resting under the gourd. But not infrequently the last scene alone is portrayed. In the same spirit the raising of Lazarus is depicted by a man standing upright at the entrance of a tomb.

**Pictures of the Saviour.**—There is no likeness of Christ attempted in the Catacombs. He is represented by the symbol of the fish and the hidden cross. The fish, in Greek, *ἰχθύς* formed the famous acrostic *Ἰησοῦς Χριστός, Θεοῦ Υἱός Θεός* (Jesus Christ Son of God Saviour) and whether written or pictured was a mystic symbol of the Saviour. The transpierced dolphin in Calixtus is the earliest copy of the Crucifixion. The disguised cross was also of frequent use, and never has this sign been in higher esteem than the first ages of the Church. It was sometimes represented thus *X*; again as an anchor *I*, now as the gamma cross *Γ*, at other times as a trident *Ψ*. The Constantine monogram *Χ*, so called from its use on the Labarum, was the common symbol of the 4th century. It was used even in inscriptions, as *in nomine Χ* or *in pace Χ*. This *Χ* was the early monogram of Christ, as *IHS* became the later one, of Jesus. There was no real representation of the Crucifixion till the Middle Ages. The Crucifix is the creation of the ages of faith, and not of the formative period of Christianity. The first pictures in the Catacombs represent Christ as young and beardless, but in the 5th century the Byzantine bearded face with severe features came into vogue. The picture of the Good Shepherd is the Catacomb Christ par excellence. It is found everywhere in the frescoes of the 2d, 3d, and early 4th centuries. The Saviour is represented in the garb of a young Roman shepherd, wearing the short sleeveless tunic, his right shoulder bare, his feet and legs sometimes bare, again covered with shoes and leggings. In some scenes he carries one of the flock upon his shoulders, in others he plays the pipe while they listen, in others still he leads them to pleasant pastures, but always and everywhere it is the Good Shepherd who seeks and saves. This picture of love was the reply of the Roman Church to the harsh doctrine of the Novations in the 3d century.

**The Saints.**—Most of the pictures of the martyrs belong to the 4th, 5th, 6th, and even 7th centuries when their graves became shrines, and were richly decorated. They are Byzantine in execution and resemble the mosaics of that period. They are valuable as witnessing the style of vestments worn by ecclesiastics of the day. The Virgin Mary appears most frequently in the Catacombs as the central figure in the Adoration of the Magi. These vary in number from two to six, but uniformly wear the Phrygian cap. The two most interesting pic-

## ROMAN CATACOMBS

tures of the Madonna are in Priscilla and Ostiano. The former is a 2d century representation of the Virgin with child in her arms, with a prophet in front of them, pointing to a star. It is a picture of much grace and excellent execution. Its classic lines do not appear again in Christian art for more than a thousand years. The latter is a 4th century Madonna and child, where the  $\chi$  is placed on either side, as though it were a painted echo of the Council of Ephesus. The divine maternity of Mary was certainly in the mind of the artist, and the features of this painting are still preserved in Greek and Russian images. The saints are sometimes portrayed as "advocates" introducing into heaven the souls of those whose bodies were buried near their shrines. This ministerial mediatorship of the saints, exhibited in the Catacomb frescoes of the 3d and 4th centuries, became a common theme of the apsidal mosaics of the basilicas.

*The Soul*.—The soul is frequently represented by a young woman standing with arms outstretched in an attitude of prayer, called an *orans*. In paradise the soul is depicted as a bird flying among the flowers or feasting on the fruits or drinking from the chalice of heavenly delights. The celestial banquet is represented some six or seven times in Saints Pietro and Marcellino by the blessed seated at a semicircular table, feasting upon the mystic fish under the guidance of Peace and Charity. The judgment of soul standing before Christ in the presence of the martyrs, seems to be the subject of some obscure frescoes.

*The Sacraments*.—In the cemetery of Calixtus are a series of so-called Sacrament chapels, where the decorations are arranged to set forth a number of Christian truths. First, comes the scene of Moses (Peter) striking the rock. "And the rock was Christ." (1 Cor. x. 4.) In the mystic water of grace a small fish is being caught by the Apostolic fisherman. Tertullian has painted the thought in words. "We as little fish are born in the water after our  $\chi$ , Jesus Christ." (Tert. de Bapt.) Then succeeds the Sacrament of Baptism, the source of the new life. The catechumen stands in the water, and the priest pours the laver of regeneration on his brow. Next follows the Eucharistic action, portrayed by a priest standing beside a tripod altar containing a fish and some bread, while an *orante* at the other side lifts her hands in prayer. The multiplication of the loaves and fishes and the banquet of Christ with his disciples by the sea of Tiberias next represent the Communion. And finally the resurrection as a result of the Communion is shown in the raising of Lazarus and the deliverance of Jonah. "He that eateth my flesh and drinketh my blood hath life everlasting, and I will raise him up on the last day." (John vi. 55.) There are two representations of the Eucharist worthy of remark. In the crypt of Lucina, the primitive centre of Calixtus, there are two frescoes (about 150 A.D.), in which two large fish carry on their back baskets containing bread and wine. Here Christ, the fish, the  $\chi$ , bears the Eucharistic bread and wine which is himself. Saint Jerome would seem almost to speak of this scene: "No one is so rich as he who carries

the body of Christ in a wicker basket and his blood in a cup of glass" (Ep. ch. xxv. ad Rustic.). Another painting of first half of 2d century, discovered by Wilpert (1894), in the archaic part of Priscilla, the Capella Græca, seems to be a real representation of the Eucharistic action of the "Breaking of the Bread." Seven persons, one of them a woman, are seated at a semicircular table, on which are two plates with five loaves and two fishes. These, however, are evidently symbolical, for the priest at the head of the table is engaged in the very act of breaking the bread, and before him sits the Eucharistic chalice. This fresco is in a chapel, and seems to be an early representation of the Eucharistic sacrifice. The representations of the other Sacraments are rare and of doubtful interpretation. A general survey of these paintings leads to the conclusion that the early Christians saw nothing in religious representations hostile to the law of Moses; that the early Church had no repugnance to art, and that the art of the Catacombs is Roman and not of Oriental origin. Mgr. Joseph Wilpert has just published an accurate and complete edition of the Pictures of the Roman Catacombs with German and Italian texts (Rome 1903).

*Sculpture*.—Christian sculpture barely existed before the 4th century. Catacomb conditions were not favorable to its growth. A fresco could easily be painted in the gloom of the grave, but carved marbles were at once expensive and required light and space for execution. Moreover the sarcophagi in the pagan shops were often covered with idolatrous scenes. Some of these have been found in the Catacombs with the pagan images effaced. With the era of peace, however, the faithful began to use sculptured sarcophagi, and a number of them are preserved in the Lateran Museum. As far as workmanship is concerned, they are of inferior merit, being executed at a time when art had greatly degenerated. Some of them are little less than carved creeds, containing on their façade the main mysteries of the Christian religion. They shed much light on the earlier paintings. The clear carving of the 4th and 5th centuries illumines the doubtful fresco of the 2d and 3d. In the sarcophagi, it is Peter striking the rock and Peter to whom Christ gives the law. Hence in the earlier paintings Moses typified Peter. Daniel among the lions on the sarcophagi is evidently Christ on the Cross. Hence we have a key to the early representations of this scene.

*Statuary*.—But few pieces of statuary have been found in the Catacombs. While idols were on all sides, the faithful seem to have held aloof from this branch of art. However several statues of the Good Shepherd were executed, and one of the 3d century preserved in the Lateran is a most beautiful representation of the subject. The sitting statue of Hippolytus of the first part of the 3d century found in the cemetery of his name, is unique among early monuments. It contains inscribed on the cathedra a list of his works and his computation of the Easter Cycle.

*Gold Glasses*.—The gold glasses of which many have been found in the Catacombs, consist of a design made of gold leaf, enclosed

## ROMAN CATACOMBS

between two pieces of glass, ordinarily at the bottom of the glass. The subjects treated in these glasses of the 3d and 4th centuries, are of two classes. Some of them are genre pictures, ornamented with the portraits of a newly married couple or a family group, and inscribed with such toasts as "Drink! Live!" They were probably gifts for wedding and family feasts. Others used probably in the liturgical functions and perhaps as Eucharistic chalices were ornamented with the ordinary Catacomb cycle of paintings, but especially with the images of the Saints. Peter and Paul, Agnes and the Virgin Mary are the subjects most frequently represented. Eighty out of the three hundred published by Garucci portray Saints Peter and Paul. The constancy of the types, their correspondence with tradition, and the medallion of same characteristics found in Domitilla and attributed to the early part of 2d century, indicate that these are portraits of the Princes of the Apostles.

**Mosaics.**—There are but few mosaics in the Catacombs, and most of these of the age of peace. The mosaic is the distinctive Christian decoration of the basilica of the 5th and 6th centuries, as the fresco was of the Catacomb in the 3d and 4th.

**Lamps.**—The common clay lamp is the object most frequently found in the Catacombs. Most of them are in no respect different from those used by the pagans. However in the 3d and particularly in the 4th centuries, they were marked with the Christian emblems of the fish, the Constantine monogram, the Good Shepherd, the palm, etc. They illustrate the way the Christian faith entered into domestic life after the advice of the Apostle: "Whether you eat or drink—do all to the glory of God." (1 Cor. x. 31). The wine flagon and the wine cup, as well as the lamp and the loaf, were stamped with the sign of the cross in the 4th and 5th centuries. The few bronze lamps unearthed are of much more elaborate workmanship and symbolism.

**Other Objects.**—Rings, seals, and coins adorned with the characteristic symbols of early Christian art, have been found frequently in the excavations, as well as a number of miscellaneous objects, such as children's toys, combs, etc.

**Inscriptions.**—The numerous Catacomb inscriptions are of the greatest interest to the Christian scholar. The most precious of them have been arranged in the Lateran Museum by De Rossi. The bulk remains yet in the Catacombs and in the gallery of Christian inscriptions at the Vatican. They may be divided according to the method of execution into carved, painted, and "graffiti" inscriptions, the latter being writings rudely scratched on the plaster or tufa; according to time, into the original epitaphs and later laudatory inscriptions; according to language, into Greek and Latin; according to content, into dogmatic and domestic. Many of the tombs are without any inscription whatsoever, and many more are distinguished but by a rude mark or some object pressed into the fresh plaster. As a rule the early epitaphs are the shorter, although brevity is a distinguishing trait of Catacomb epigraphy, in marked contrast to the lengthy pagan eulogies of the time. The name of the

departed, with a short prayer and some symbol as the fish, palm, anchor, or Constantine monogram, to which was sometimes added the date of burial and age, forms the ordinary inscription. "Gerontius, may you live in God," "Lucilla in pace"; are characteristic epitaphs. The word "deposition" is peculiar to Christian epigraphy, implying that the body is consigned but for a time to the soil. The short prayers and symbols on the tombs are in general but a reproduction of the "Memento of the Dead in the Mass," *Ipsis, Domine, locum refrigerii, lucis, et pacis, ut indulgeas, deprecamur*, "Refreshment, light, and peace grant to them, O Lord." This is the requiem chanted and carved in the Catacombs. Despite the fact that the inscriptions are sepulchral, they yet contain much matter of dogmatic and historic interest. They express belief in the unity and trinity of God, in the divinity of Christ, in the Holy Spirit, in the resurrection, and almost every article of the creed is carved on some monument. Especially strong is the testimony of the Catacombs to prayers for and to the dead. Both are sometimes found in one inscription, as this from Domitilla:

VIBAS  
IN PACE ET PETE  
PRO NOBIS.

"Gentianus,—pray for us because we know that thou art Christ," we read in another. "Holy Martyrs, remember Mary," comes from Aquileia. *Januaria bene refrigera et Roga pro nos*. This last inscription from Calixtus is a fair sample of Catacomb Latinity. It is ornamented with a small box, containing the rolls of the law, the customary representation of the Bible in early Christian art.

**Papal Crypt.**—The inscriptions of the crypt where the Popes of Rome were interred in the 3d century, are of peculiar interest.

ΑΝΤΕΡΩΣ Ο ΧΥΙ Ο ΑΒΙΑΝΟΣ · ΧΥΙ · ΡΡ

These inscriptions show that Greek was still the official language of the Church in the 3d century. The monogram Mr, martyr, was the official canonization of the Catacombs.

**Damasene Inscriptions.**—Pope Damasus (304-385), the first Christian archaeologist, embellished the tombs of the martyrs with a series of metrical inscriptions, carved on large slabs of marble by his secretary, Furius Dionysius Filocalus. The texts of 40 of these are preserved in the ancient itineraries, and many of the original slabs have been discovered in the excavations of the last 50 years. The inscription of the papal crypt was found broken: in 125 small pieces, which when joined together, gave the entire text. Of all these inscriptions, but a fragment of the title at the tomb of Pope Cornelius remains in its primitive position, so thorough was the work of the devastating Lombard and destroying time. The tomb of Damasus himself, so long sought by the archaeologists, was discovered at the close of 1903 by Mgr. Wilpert. The work of excavating is still going on, but enough data has already been dug from the depths to make it certain, that whoever would go back to Christ, must pass through the corridors of the Catacombs. Here he will find the mind of the Master in

## ROMAN CATHOLIC CHURCH

the might of the martyr, and the love of the Saviour in the liberty of the slave. Here he will find church and Sacrament, right and ritual, creed and deed. Here he will come upon a society, Catholic in composition and in charity, Christian in faith and in hope, sleeping the sleep of peace and awaiting the resurrection of the flesh in X. The scientific study of the Catacombs has shown that the Christians were numbered in Rome by tens of thousands in the 3d century. "We are of yesterday yet we fill all that belongs to you; we leave to you only your temples." The rhetoric of Tertullian is the reality of the Catacombs. The researches of De Rossi have shown, too, that the acts of the martyrs have much more historical value than the critical school of history was formerly inclined to give them. Further and fuller research will act as luminaria to dissipate the darkness which controversy has gathered round the Catacombs. And when the treasures of Roma Sotterranea are all unearthed, should all other witnesses of the faith once delivered to the saints become silent, the very stones of the Catacombs will cry out to the world the wisdom and grace of Christ.

Consult: Lowrie, 'Monuments of the Early Church' (1901), gives in an appendix the best Catacomb bibliography accessible to the English reader. WILLIAM TEMPLE, D.D.,  
Formerly Professor of Philosophy, Saint Joseph's Seminary, Dunwoodie, N. Y.

**Roman Catholic Church.** See CATHOLIC CHURCH.

**Roman Catholic Church in Canada.** The, will be treated in this article under three headings: 1. The Church under the French, from the discovery of Canada until the conquest by England (1534-1763); 2. The Church under the rule of Great Britain, from 1763 until the present day; 3. Present condition.

1. *Before 1763.*—Catholicism was planted in Canada by France, through whose sailors, Aubert de Dieppe (1508), Verazzano (1522), and especially Jacques Cartier (1534), it was discovered about the beginning of the 16th century. Cartier penetrated the estuary of the Saint Lawrence (10 Aug. 1535), and took possession of the country in the name of King Francis I. While endowing his fatherland with new countries, he proposed also to disseminate therein the Catholic faith, as related in the account of his travels inserted in the 'Histoire de la Nouvelle France' by Marc Lescarbot, Paris 1609.

From Cartier to Champlain (1542-1608) a few attempts at colonial settlement in Acadia was succeeded by the foundation of Port Royal (now Annapolis, N. S.). There appeared the first missionaries, Jesuits and secular priests. Champlain visited Canada in 1603, and in 1608 founded the town of Quebec and settled there. In 1615 he invited Recollet Fathers from France, who became the first apostles to the Indians, and inaugurated those missions in the interior of Canada so famous during the 17th century, and in which the Jesuits (1625) and the Sulpicians (1657), soon took such a glorious part.

Two distinct and savage races, the Algonquians and the Huron-Iroquois inhabited the countries just opening up to missionary zeal.

To the Algonquin race belonged the Abenakis, the Montagnais, the Attikameques or Poissons-Blancs, the Ottawawas, and several other tribes scattered from Hudson Bay to the western prairies. From the Huron-Iroquois source sprang two great branches: the Wendats or Hurons established between Lakes Huron, Erie, Saint Claire, and Simcoe, and the Iroquois who dwelt south of Lake Ontario, and were divided into five nations: Mohawks, Onondagoes, Senecas, Oneidas, and Caiyoquas. It would appear that the total population of these tribes was not above 100,000 individuals.

The Recollets were the first to devote themselves to evangelization among the Indians. Father d'Olbeau instructed the Montagnais; Father Le Caron penetrated deeply into the land of the Hurons to carry them the true faith, while several fathers remained at Quebec preaching among the colonists and the surrounding savages. During ten years they multiplied their travels, their preachings, opened schools for Indian children, called to their assistance new recruits, and among them Father Viel, who perished in the Ottawa River, victim of the perfidy of a Huron. Consult: F. Sagard, 'Histoire du Canada,' Paris 1686; Ch. Beaubien, 'Histoire du Sault-au-Récollet,' Montreal 1897. Unable to fill the wants of the missions alone, the Recollets called upon the Jesuits (1625), and on their invitation Fathers Brebeuf and Lalemant with other missionaries came to Canada. Their efforts for the conversion of the savages were not attended with the success hoped for, owing to the opposition of the Company of Merchants, to whom the French king had conceded the monopoly of traffic in these regions, on the condition of founding a colony. Louis XIII. and Richelieu replaced them (1627) by the Company of New France who engaged to lead "the people inhabiting Canada to the knowledge of God, and to instruct them in the Catholic, Apostolic and Roman religion." There was no time to see the effects of these good intentions, for less than two years later (1629), Quebec and the colony fell into the power of David Keith, who fought on the side of England. The missionaries and their helpers were obliged to return to France.

When Canada was returned to France by the Treaty of Saint German-en-Laye (1632), the Jesuits at the request of Cardinal de Richelieu again took up their missions. Father Lejeune organized religious service at Quebec and opened the college of that town (1635), then he plunged into the interior in search of the wandering tribes of Montagnais. Others established a mission at Miscou, and from there branched forth into the peninsula of Gaspé, into Acadia and Cape Breton. Trois Rivières and Tadoussac on the banks of the Saint Lawrence became centres of evangelization. Consult 'Les Jésuites et La Nouvelle France au XVIIe siècle,' par le Père de la Rochemontaigne, S. J. Paris, 1895.

Meanwhile hospital religious and Ursulines arrived at Quebec (1639), the first to direct a Hôtel-Dieu endowed by the Duchess of Aiguillon, niece of Richelieu; the second at the head of whom was Marie de l'Incarnation, to provide for the education of the girls. These heroic women were rivals in zeal for the conversion of the savages. Consult: Abbé Casgrain, 'Histoire de l'Hôtel-Dieu de Québec,' Québec, 1878;

Id., 'Histoire de la Vénérable Marie de l'Incarnation,' Québec, 1880; 'Lettres de Mère Marie de l'Incarnation,' Paris, 1681.

About this time the Company of Montreal was formed. Its originators were two men of God, M. Olier, founder of the Seminary of Saint Sulpice, and M. de la Dauversière, a pious lay. Its sole aim was the "glory of God and the establishment of religion in New France without charge to the clergy or to the people." Encouraged by Urban VIII., it found in Paul Chomedey de Maisonneuve a faithful executor of its intentions. This illustrious man landed on the island of Montreal which the society had acquired, 18 May 1642, and laid the foundations of Ville-Marie, now Montreal. With him came Mlle. Manca, foundress of the Hôtel-Dieu, and they were soon joined by Marguerite Bourgeoys, an energetic and saintly woman, who organized the religious of the Congregation of Our Lady (1653) for the education of Canadian girls. In 1657, Mr. Olier when dying, sent to the colony the first four Sulpicians: de Queylus, Souart, Gallinier and d'Allet. Consult: Dollier de Casson, S. S., 'Histoire du Montréal,' published by the Historical Society of Montreal, 1869; Faillon, S. S., 'Histoire de la colonie française en Canada,' Montreal, 1865; Id., 'Vie de la Vénérable Mère Bourgeoys,' 'Vie de Mlle. Manca,' Paris, 1854; Id., 'Vie de M. Olier, founder of the Seminary of Saint Sulpice,' 3 vols. Paris, 1873; P. Rousseau, S. S., 'Vie de Paul Chomedey de Maisonneuve,' Montreal, 1886.

The hour of martyrdom sounded for the Jesuits. After escaping twice from the ferocious Mohawks, Father Jogues died beneath their blows (1646). Two years later (1648), the flourishing mission among the Hurons was completely destroyed by the Iroquois, and five Jesuits, Fathers de Brebeuf, Daniel, Lallemant, Garnier and Chabanel, were overwhelmed in the massacre of their neophytes. Father Buteux also fell a victim to the Iroquois when going to the Attikamegues (1652), and Father Bressani escaped with difficulty from these barbarians. Consult: Charlevoix, 'Histoire et Description générale de la Nouvelle France,' Paris, 1744; 'Relation des Jésuites,' Québec, 1868; these two works with the 'Relations inédites de la Nouvelle France' (1672-1779), and other documents have been collected and published with an English translation in the edition of Reuben Thwaites, Cleveland, 1897, under the title: 'Travels and Explorations of the Jesuit missionaries in New France' (1610-1791); Parkman, 'The French pioneers in North America.' These attacks of the Iroquois became the terror of the colony. Montreal owed its salvation only to the bravery of Maisonneuve and to the heroic devotion of young Dollard, who at the head of sixteen companions for several days faced over seven hundred Iroquois, and resisted them to the death.

The year 1659 marks the commencement of the ecclesiastical hierarchy in Canada. Monsignor François de Montmorency-Laval was named Bishop of Petrea and Apostolic Vicar of New France by Alexander VII. The prelate had numerous difficulties with the governors d'Avançon and de Mézy (1663-1665) over the traffic in brandy which was causing ruin among the Indians. He opened a small seminary for

the training of future clerks, and 10 years later (1678), laid the foundations of a large seminary for preparation for the priesthood. In 1674 Québec was created a bishopric by Clement X.; the jurisdiction of the new see extended over all North America until 1789, the year in which the bishopric of Baltimore was created. To Monsignor Laval are also due, the creation of charges with resident priests, the incorporation of the Seminary of Québec and its union with the Seminary of Foreign Missions at Paris, the creation of a chapter of canons; in one word a good diocesan organization. He came in conflict with Governor Frontenac and Intendant Talon to maintain the rights of the Church and to extirpate the abuse of the liquor traffic.

Under his episcopacy the missionaries continued their work. The Sulpicians saw two of their number fall beneath the blows of the Iroquois at Ville-Marie (1663). Shortly after Messieurs Trouvé and de Salignac-Fenelon, brother of the illustrious Archbishop of Cambrai, founded the mission of Kenté (1668), at the point on Lake Ontario where debouches the Saint Lawrence. During fourteen years it was a centre whence the true faith radiated throughout all the surrounding region as far as Niagara. The following year (1669) Messieurs Dollier de Casson and Bréhan de Gallinée, Sulpicians, left Ville-Marie in the company of Cavalier de La Salle with the resolution of advancing west to the Mississippi. Abandoned by the discoverer they traversed alone the region of the Great Lakes, and returned to Montreal after one year of exploration and research; there M. de Gallinée prepared a relation and made a map of the expedition. We should mention also the Sulpician missions of la Montagne, Gentilly, l'Île-aux-Tourtes and Lac-des-Deux-Montagnes, all in the environs of Montreal. The Jesuits on their side prosecuted arduously their missions. Father Menard evangelized the Outaouais, Father Allouez penetrated as far as Lake Superior (1665), and Fathers d'Ablon and Marquette planted the cross at Sault Sainte Marie. Other Jesuits joining the explorers Saint-Lusson and de La Salle, took possession of the banks of Lake Huron; and two years after (1670) Father Albanel penetrated, while traveling by the Saguenay, as far as Hudson Bay. The missions to the Iroquois were resumed, but without great success. In 1669 the sedentary mission of the Prairie de la Madeleine was founded to the south of Montreal. There expanded the lily of Canada, that Catherine Tegakouita, who died in her twenty-third year, and for whom the III. Council of Baltimore has asked the process of canonization. This mission transferred to Sault-Saint-Louis, now Caughnawaga, is still flourishing (having over 2,000 members), and after numerous vicissitudes has again come into the hands of the Jesuits. From Canada also went Joliet and Father Marquette on their discovery of the Mississippi (1673). Consult: 'Récit des voyages et découvertes du Père Marquette,' New York, 1855; Reuben Gold Thwaites, 'Father Marquette,' New York, 1902.

Recalled to Canada by Talon, the Recollet Fathers (1670) established themselves at Québec and had four missions: Trois-Rivières, Île Percée (Gaspé), Saint-John River and Fort Frontenac on Lake Ontario. In 1682, Mr. Dollier de Casson called them to Montreal, and in

## ROMAN CATHOLIC CHURCH

1696 the missions of Cape Breton and of Plaisance in Newfoundland were confided to them.

Meanwhile Monsignor Laval worn out with his administration, gave in his resignation to Louis XIV. (1684). After four years' sojourn in France, he returned to Quebec (1688), where he lived in profound retirement until his death in 1708. The episcopacy of Monsignor Laval marks one of the most prosperous epochs of the Canadian Church and of the colony. Between 1665 and 1680, thanks to the intelligent activity of Colbert and de Talon, more colonists came to Canada than in the preceding half century. A strict supervision was exercised in the choice of the young women sent, as much as regarded their physical as their moral qualities. Several whose loose manners might have become a cause of corruption and decadence rather than of growth, were rejected. Consult: Gailly de Taurines, 'La nation canadienne,' Paris, 1894; Farland, 'Cours d'histoire du Canada.'

Monsignor de Saint-Vallier succeeded Monsignor Laval. The new bishop founded the general hospital of Quebec, endowed it with his own contributions, built the episcopal palace, published a catechism for the diocese, established ecclesiastical conferences, and held the first synods. In 1690, the English admiral Phipps, having attacked Quebec with 32 vessels, the prelate in a pastoral letter exhorted the Canadians to bravely do their duty. When after useless efforts the enemy had departed, the bishop dedicated to Our Lady of Victory, the church in the lower town, still standing, as a monument of Heaven's protection.

The era of great missions passed; nevertheless Cadillac and a missionary founded the town and colony of Detroit (1700); the priests of the seminary of Quebec became the apostles of the Tamarois, between the Illinois and the Ohio Rivers; the Jesuits evangelized the Miami, the Sioux, the Ottawas, the Illinois, and held their ground amid the Iroquois. With the opening of the 18th century, commenced the furious and repeated assaults of England and its American colonies against the little Catholic colony, in which the French Government, careless of the future, became less and less interested. The emigration to New France ceased toward the end of the preceding century. No more were to be seen the great convoys setting sail for America crowded with new populations full of faith and energy. In 1713 the French Canadian population was 18,000, and in 1739 scarcely reached 42,000. It was a small number to resist an adversary which counted in 1706 260,000 individuals, and which was increasing each year.

Acadia especially was weak, having but two thousand inhabitants of French origin. The first attacks were directed against her. After having resisted in 1704 and in 1707, she fell (1710) into the power of the English colonists, and three years later, the Treaty of Utrecht (q.v.) (1713) ceded Acadia, Newfoundland, and Hudson Bay to England. From this epoch to that of the violent dispersal of the Acadians by Lawrence (1755), the Catholics found devoted support in the Sulpicians and the priests of the seminary of Quebec who were their missionaries. The names of Geoffroy, Baudoin, Trouvé, de Breslay, Metivier, de la Gondolle, de Miniac, Chauvreuse, and Desenclaves, of

Saint-Sulpice; of Petit, Thury, Gaulin, of the seminary of Quebec, deserve to be remembered by posterity. Mention should also be made of Father Rasles, S. J., missionary to the Abenakis, who was killed by the English. We will not recall here the incredible atrocities which have relegated Lawrence's memory to the execration of humanity, and which Longfellow has immortalized in his touching poem 'Evangeline.' Consult: Richard, 'Acadia, Missing Links of a Lost Chapter of American History,' (Montreal, 1895); Abbé Casgrain, 'Les Sulpiciens en Acadie' (Quebec 1897); Id., 'Un pèlerinage au pays d'Evangeline' (Quebec, 1895).

These painful events only too plainly foreshadowed the fate awaiting the Canadian colony. Instead of sending men, France persisted in raising at great expense useless fortifications at Louisbourg and at Quebec. Canada was to fall through lack of foresight.

The episcopacy of Monsignor de Saint-Vallier lasted until 1727. The endowments with which he enriched the various religious establishments of the country, have been estimated at \$600,000. His successor, Monsignor Duplessis-Mornay, never came to Canada. He governed his diocese by an administrator. Resigning in 1773, he was replaced by Monsignor Dosquet who devoted himself to promoting the education of youth and the religious life in the communities. Monsignor de Lauberivière who succeeded him, died a month after his arrival in his diocese, victim of his charity in attending soldiers attacked with scurvy (1740). His successor was Monsignor de Pontbriand (1741-1760), the last bishop under the French régime. He built a cathedral, restored the Ursuline monastery at Trois-Rivières and the Hôtel-Dieu of Quebec, which had been destroyed by fire, established ecclesiastical retreats, and by his science and virtue was the model of his clergy.

Among eminent priests of this epoch should be mentioned M. de Belmont, superior of Saint-Sulpice at Montreal (1701-1732), who covered the region with his liberalities and his works; M. Normant du Faradon, his successor (1732-1759), who with the Venerable Mother d'Youville shares the glory of having founded the admirable charitable institution of the Grey Sisters. Consult: Faillon, S. S., 'Vie de la Vénérable Mère d'Youville' (Montreal, 1852). To Saint-Sulpice belonged also that abbé Picquet to whom the town of Ogdensburg erected (1899) a monument, as well as to its founder. Consult: 'Lettres édifiantes et curieuses' (Lyon 1819); 'Mémoire sur la vie de M. Picquet' by M. de la Lande, of the Academy of Sciences, p. 266; 'Biographie universelle ancienne et moderne' (Paris 1823, Vol. XXXIV. p. 289); 'Revue canadienne, janvier et février 1870,' Vol. VII; 'l'abbé Picquet,' by J. Tassé.

The events which precipitated the fall of Canada are well known. Quebec taken (1759), the bishop died at Montreal (1760) without seeing that town in the hands of the English. M. Briand undertook the administration of the region of Quebec; M. de Montgolfier, Sulpician, of that of Montreal. The Treaty of Paris which ceded Canada to England was signed to Feb. 1763. The period of establishment closed for the Canadian Church, and that of conflicts and of progress opened.

## ROMAN CATHOLIC CHURCH

2. *After 1763.*—All the natural chiefs of the Canadians recrossed the ocean with the French flag. A population of 70,000 souls was abandoned without a guide. The clergy alone remained, invested with the double mission to preserve the ancestral faith and direct the people in the attainment of their civil and political rights. They understood their mission and it can be truthfully said that they did not fail therein.

The Treaty of Paris, it is true, guaranteed the Canadians "the free exercise of their religion," but with the addition "so much as the laws of Great Britain will permit." This restriction left a great latitude in the interpretation of the treaty. In fact it was a species of persecution. The government of London thought to substitute the Anglican hierarchy and religion for the Catholic hierarchy and religion and flattered itself in easily overcoming the conscience of a handful of colonials. The French laws were abolished and the oath of allegiance exacted from all Canadians. They notified the priests that they would have to subscribe to it or prepare to leave Canada. It was a demand to abjure and rebel against the authority of the Roman See. At the same time they prepared a list of the churches, the priests, their charges, their revenues, their property, also one of the religious communities with their constitutions, rights, privileges, and properties. In addition George III. encouraged the governors to found Protestant schools so that the Church of England could be established in principle and in practice, and the inhabitants gradually be brought to embrace the Protestant religion, and their children educated in the principles of that religion.

The communities of men were also condemned to die out. Recollets, Jesuits, and Sulpicians were prohibited from recruiting in the country or from receiving members from abroad. They took possession of the properties of the first, and as to the Sulpicians, they were reduced from 30 which they were in 1760, to two septuagenarians, whose deaths they awaited to take possession of their effects, when the French Revolution broke out. The English Government then relaxed its rigorous attitude and offered the victims of the furious revolutionists an hospitality which does them honor. The people though were not better treated. For them there were no public positions, no place in the councils of the colony. A species of ostracism followed them everywhere. In the midst of these painful conjunctions the Catholics did not despair; they sent to London petition upon petition claiming on the faith of the treaties the preservation of their religion, their priests, their language, and their civil rights. At last in 1766, George III. consented to the consecration of Monsignor Briand, as Bishop of Quebec, without recognizing any other title, however, than that of Superintendent of the Catholic cult.

Meanwhile a storm was arising in the Anglo-American colonies. The metropolis understood that it should conciliate the Canadians. The Act of Quebec (1774) restored the French civil laws, dispensed with the test-oath, and recognized their civil and political rights. During the war which followed and which terminated with the death of Montgomery (1775)

under the walls of Quebec, the Canadian people, docile to the voice of their clergy, remained faithful to the sovereign which Providence had given them.

During these years the Catholic population had grown: in 1784, it numbered 130,000 French-Canadians; the Maritime Provinces were being peopled by Irish and Scotch Catholics, and the Acadians dispersed in 1755, were grouping silently and multiplying, supported by such apostles as the abbés, Desjardins, Sigogne, de Calonne, and Ciquart, Sulpician. "To these confessors of the faith the Acadian race owed its organization; these were the true founders of its nationality." Consult: 'Vie de l'abbé de Calonne,' (Trois-Rivières, 1892); Casgrain, 'Pèlerinage au pays d'Évangéline.'

After having courageously combated, Monsignor Briand died in 1784. His successor, Monsignor d'Esglis, was an old man of 75 years. He speedily took a coadjutor in the person of Monsignor François Hubert, who became titular bishop in 1788. In a remarkable memoir to the Holy See (1794), the prelate states that his diocese contained 160,000 Catholics; that the efforts of the Anglicans to win the Canadians to their religion were in vain, that his diocese is too vast for him to administer conveniently. But, he added "every plan of division would find insurmountable obstacles on the part of Great Britain which is occupied on the other side in the means to establish in this country a Protestant clergy." Consult: 'Mandements des évêques de Québec,' Vol. XI., p. 474.

Monsignor Dénaut (1797-1806), succeeded Monsignor Hubert. Under his episcopacy the fight against Anglicanism is summed up in the Royal Institution. Thus was named a cleverly composed organization designed to monopolize instruction of every degree by concentrating the power in the hands of the governor. The Anglican Bishop Mountain was chosen as president of the Institution. Profiting by a legal restriction the Catholics prevented its success. Consult: S. Pagnuelo, 'Études historiques et légales sur la liberté religieuse en Canada,' (Montreal, 1872).

From 1806 to 1825 the episcopal see of Quebec was occupied by Monsignor Octave Plessis, a prelate distinguished as much by the breadth of his intelligence and the force of his character, as by his courtesy in all proceedings. He had to hold his own against a powerful oligarchy which would not recoil from extreme measures, and which was resolved to make the Church the vassal of the civil power, the slave of the government; in fact to insensibly lead Canada to Anglicanism by the governmental channel. The soul of this plan was a certain Witzins Ryland, secretary of the governors of Canada from 1790 to 1812. It would take too long to enter into the details of this struggle, into which Sir James Craig was weak enough to enter; it suffices to say that Monsignor Plessis by his individuality embodied Canadian resistance without ever wounding English sentiment; that he obtained for himself official recognition of his title, Bishop of Quebec (1813); that he removed the pretensions of the government to nominate rectors; that he ensured the independence of the Church against the State; and that he inspired his adversaries even, with respect and admiration for his great

## ROMAN CATHOLIC CHURCH

character. Faithful besides to the Crown of England, his was the act of a loyal subject in calling to arms his diocesans, on the occasion of the invasion of the United States in 1812. Well and justly could Lord Bathurst reply to the Anglican Bishop of Quebec, J. Mountain, who protested against the favors accorded Monsignor Plessis by the London Government. "It is not when Canadians are fighting for England that such questions should be agitated." Consult: Pagnuelo, 'Etudes sur la liberté religieuse en Canada,' c. IX.-XI., p. 86-120; 'Le Correspondant,' April, 1877; 'La France Canadienne,' by J. Guérard; Garneau, 'Histoire du Canada,' t. III. i. XIII. c. II. and t. XIV. c. I.; 'Mandements des évêques de Québec,' t. III.; 'Conversation entre Sir J. Craig et Mgr. Plessis,' p. 59; 'Mémoire au gouverneur,' p. 79; French 'Biographical notice of J. O. Plessis, Bishop of Quebec,' (Quebec, 1864); L. O. David, 'Biographies et portraits,' (Montreal, 1876, p. 80); Bédard, 'Histoire de Cinquante ans,' (1791-1841), (Quebec, 1869, c. IV. et V.).

Monsignor Plessis understood the necessity for dividing his vast diocese. Already in 1817 New Scotland was detached with Monsignor E. Burke as Apostolic-Vicar. This did not suffice. Soon the Apostolic-Vicariates were created of Upper Canada with Monsignor MacDonell as titular; of New Brunswick and Prince Edward's Island, with Monsignor MacEachern; of the Northwest with Monsignor Provencher; of the district of Montreal with Monsignor Lartigue, Sulpician (1820). These divisions were completed after the death of Monsignor Plessis, by the creation of the sees of Kingston (1826); Charlottetown (1829); and of Montreal (1836).

In the course of years the number of French-Canadians kept on increasing. In 1831 it attained 380,000. In less than 50 years, it had increased by nearly 280,000 souls. This progress was not of a nature to reassure the intolerant and exclusive set which existed on the side of the Anglo-Protestants. Already, about 1820, they had tried to abolish the constitution of 1791, which assured an independent existence to the Province of Quebec, and wished to unite Upper and Lower Canada, with the scarcely veiled object of outnumbering the French Catholic population. This plan had failed, thanks to the firmness of Bishop Plessis and his clergy, who rallying the forces of the country, victoriously opposed Protestantism. Unfortunately, after the death of the bishop, several influential members of the legislative body deserting the sure ground of legal resistance, slipped upon the slope of revolution, fanned the spirit of revolt by their indignant philippics, and provoked the troubles of 1837-8, when several hundred countrymen led astray by their representatives, flew to arms. Nevertheless, let us say that the voice of the Catholic clergy was sufficiently powerful to keep the mass of the population in the path of duty. The result of this insurrectional movement was the union of the two Canadas. The Act of Union was passed by the Britannic Parliament 23 July 1840.

Before this act of despotism (consult Turcotte, 'Le Canada sous l'Union,' p. 60), which marks an important date in the history of Canada, several works had been created, several

deeds accomplished which interest the Church. The seats of education had multiplied: the college of Montreal (1767) founded by M. Curat-teau, priest of Saint-Sulpice, and then (1806-28) so prosperous under the direction of M. Roques; the colleges of Saint-Hyacinthe (1809), of Sainte-Thérèse (1825), of l'Assomption (1832), of Sainte-Anne de la Pocatière (1839). Mention should be made also of the formation of the Société d'éducation of Quebec, to promote primary instruction, and the acceptance of the Factory Law (1824), so favorable towards the same end. To this same period belongs the acknowledgment of the properties of the Seminary of Saint-Sulpice at Montreal by the government of Queen Victoria (1839). This act of justice allowed this venerable institution to follow the course of its charities and to cover the Montreal region with its intelligent liberalities.

To Monsignor Panet, who had replaced Monsignor Plessis (1825-1832), succeeded Monsignor Signay. His episcopacy was marked by many misfortunes: cholera (1834), civil war (1837-8), two fires in Quebec (1845), typhus brought by the Irish driven from their country (1847). The 15 years which followed 1840 were more fruitful for the Canadian Church. Five communities of men, and 15 of women dedicated to the ministry, to teaching, or to charity, came from France to settle in Canada. The Oblate Fathers of the Immaculate Mary (1841), the Jesuits (1842), the clerks of Saint-Viateur, the Congregation of Sainte-Croix (1847), and the Brothers of the Christian Schools answered to the call of Monsignor Ignace Bourget, Bishop of Montreal (1840-79). Then were founded the Sisters of Providence (1843), of the Holy Names of Jesus and Mary (1843), of Mercy (1848), of Saint Anne (1849). At the same time the episcopal sees were multiplied: Toronto with Monsignor de Charbonnel, S. S. (1842); Saint John, N. B. (1842). Quebec elevated to the dignity of an archbishopric received as suffragan sees Montreal, Kingston, and Toronto. The same year (1844) the bishopric of Arichat, N. S., transferred to Antigonish since 1886, was created: in 1847 the see of Bytown or Ottawa and of Saint John, Newfoundland. United in council at Quebec (1851), the bishops decide on the foundation of Laval University and ask the Holy See to establish the sees of Trois Rivières and Saint Hyacinthe (1852). Let us mention also the foundation of societies for colonization, for temperance, of Saint-Vincent de Paul, and of an educational system for separate schools for Catholics.

Meanwhile the Catholic population had increased considerably. In the Province of Quebec it more than doubled in 30 years; in 1831 it counted 425,000, in 1861, 942,800 souls; in Ontario it attained 260,000. This development demanded the multiplication of primary schools. This was the work of J. B. Meilleur, of whom it can be said, "he undertook the direction of Public Instruction from its cradle; that he had to create everything even to the love of instruction among the people." Consult: J. B. Meilleur, 'Mémorial sur l'éducation au Bas-Canada,' Quebec, 1876. The Catholic colleges were opened of Joliette (1846), of Rigaud (1850), of Saint-Lawrence (1847), of Saint Mary of Monnoir and Lévis (1853). That

## ROMAN CATHOLIC CHURCH

same year (1853), the Seminary of Quebec undertook the heavy but glorious task to build Laval University which was inaugurated in the presence of Lord Elgin, 14 September 1853, and which since has rendered such immense services to the Catholic cause and to the country. Consult: C. Roy, 'L'Université Laval et les fêtes du Cinquantenaire,' Quebec, 1903.

While these works were being accomplished in the East, the West was opening to evangelization. With Monsignor Provencher, the first apostles of these districts had penetrated along the Red River. Wishing to ensure the future of these missions, the Bishop of Saint-Boniface called to his assistance the Oblate Fathers and even chose from them Father Taché as coadjutor. Monsignor Provencher died in 1853 and was succeeded by Mgr Taché. He had to expend his intelligence and his strength during 40 years (1853-94). It does not enter into the limited scope of this essay to recount the works of the Oblates in the Far West; although they constitute one of the most remarkable chapters of the Catholic missions. The apostolic-vicariates and the episcopal sees embrace in their jurisdiction every point in these distant regions which came under the indefatigable zeal of these missionaries.

Consult: G. Dugas, 'Monsieur Provencher et les Missions de la Rivière-Rouge,' Montreal 1889; Piolet, S. J., 'Les missions Catholiques (françaises),' Paris 1902; Monsignor Taché, 'Vingt années de missions dans le Nord-Ouest de l'Amérique,' Montreal, 1869; Don Benoit, 'Vie de Monsigneur Taché,' Saint Boniface, 1904; Père Jonquet, O. M. I., 'Vie de Monsigneur Grandin,' Montreal, 1904; R. Cooke, O. M. I., 'Sketches of the Life of Monsignor de Mazenod,' London, 1879.

The years which followed 1860 were full of solicitude for the Catholic clergy. The Councils of Quebec show us the bishops preoccupied with the progress of impiety, with evil books, with the weakening of the faith, and painfully affected by the events which led to the invasion of the Pontifical domains by the armies of Victor Emmanuel. The Canadians flew to arms and several detachments of zouaves offered their services to Pope Pius IX. (1868).

The Catholic hierarchy had developed in the course of years. In 1852, Halifax was created an archbishopric with Charlottetown, Saint John, N. B., Arichat, N. S., and soon after Chatham, N. B. (1860), as suffragan sees. The year 1871 marked the creation of the ecclesiastical province of Saint Boniface (Manitoba), with the bishopric of Saint Albert (1871), and the apostolic-vicariates of Athabasca-Mackenzie and of Saskatchewan for suffragans. In the preceding year (1870) Upper Canada was created an ecclesiastical province with Toronto for archbishopric and Kingston and Hamilton for suffragans. Since then Kingston has become an archiepiscopal see (1878) with two suffragans: Peterboro (1882) and Alexandria (1890). In the province of Quebec, Sherbrooke (1874), Chicoutimi (1876), Nicolet (1885) became bishoprics. In 1886, Montreal was created an archbishopric under Monsignor Fabre, with Saint Hyacinthe and Sherbrooke as suffragans, to which have since been added Valleyfield (1893), and Joliette (1904). The same year Leo XIII. created the ecclesiastical province of

Ottawa, which received as suffragan the episcopal see of Pembroke (1898). To crown this flourishing hierarchy, Leo XIII. honored with the cardinal purple Monsignor Taschereau, Archbishop of Quebec (1886). To conclude the study of the second half of the 19th century, mention must be made of three particular points. a. The Awakening of the Acadian Race, which had expanded imperceptibly.—From the 25,000 that they were in 1815, the Acadians increased to the number of 80,000 (1864), and 125,000 (1899). To Father Lefebvre, a Canadian priest, is due the merit of having amalgamated them and, in founding the college of Memramcook, N. B., of having contributed powerfully to render them a force for Catholicism in the Maritime Provinces. To-day the Catholics of French origin in that region amount to 155,000. Consult: P. Poirier, 'Le Père Lefebvre et l'Acadie,' Montreal, 1898. b. The Schools of New Brunswick and of Manitoba.—In 1867 when the Canadian Confederation was founded, the educational system of New Brunswick allowed the Catholics of that province to have separate schools. This right was refused them in 1871, the aim being to compel them to send their children to the public schools, that is to say, Protestant schools. An organized resistance spread everywhere and to avoid a sanguinary conflict, a compromise was effected. The unjust law was not abrogated but the concessions were of such a nature that peace was re-established (1874).

An injustice of the same kind wronged the Manitoban Catholics in 1890. Despite the vigorous fight led by Monsignor Langevin, successor to Monsignor Taché in the see of Saint Boniface, the iniquity was not amended, but a compromise was arranged between the Laurier Government and the Holy See, which for want of a better, softened without destroying the disastrous effects of the law. This question which so impassioned the minds in 1896 gave rise to the creation of the Apostolic Delegation to Canada, a post first occupied by the present Secretary of State to Pius X., Cardinal Merry del Val, and now, by Monsignor Donato Sbarretti, ex-archbishop of Havana, who succeeded (1902) to Mgr. Diomede Falconio, presently apostolic delegate to the United States. c. The foundation of Laval University at Montreal.—For a long time Montreal was in want of a Catholic university. Monsignor Bourget applied to the Propaganda. Not to injure the rights of Quebec, a branch in Montreal was granted by the pontifical bull *Inter varias sollicitudines* (1876). The powers and the autonomy of this branch were signally increased by Leo XIII. (1899). In need of the necessary buildings, the liberality of the Seminary of Saint Sulpice, governed then by M. Colin, filled this void. Laval University at Montreal now has spacious premises and numerous professorships.

3. *Present Condition.*—(a) Ecclesiastical provinces.—The total Catholic population in Canada is estimated at 2,230,000 by the census of 1901. Since then it has increased about 100,000 through immigration. With 1,430,000 Catholics, the province of Quebec alone comprises three-fifths of the faithful followers of Rome in Canada. Nearly 900,000 are scattered throughout the other provinces. Everywhere, except in Ontario, in Manitoba and in British

## ROMAN CATHOLIC CHURCH

Columbia, Catholicism exceeds in the number of its adherents any of the separate Protestant sects. It embraces 42 per cent of the total population of the Dominion, which is 5,371,315. From 1890 to 1900 the Catholics increased by over 250,000 souls. This gain was effected despite a very pronounced emigration movement of French Canadians to the Northeast of the United States. The following table gives at a glance the ecclesiastical divisions of the Dominion of Canada:

| ARCHBISHOPS<br>SUFFRAGAN<br>BISHOPS     | Titulars in 1904       | Catholics | Priests | Churches<br>and Chapels |
|---|------------------------|-----------|---------|-------------------------|
| <b>QUEBEC</b> .....                     | L. N. Bégin.....       | 325,000   | 550     | 240                     |
| Trois-Rivières .....                    | F. X. Cloutier.....    | 76,800    | 110     | 79                      |
| Rimouski .....                          | A. Blais.....          | 99,140    | 128     | 116                     |
| Chicoutimi .....                        | T. Labrecque.....      | 60,000    | 100     | 100                     |
| Nicolet .....                           | H. Brunault.....       | 83,824    | 118     | 118                     |
| Préf. Apost. du<br>Bas St Laurent ..... | P. Blanche.....        | 9,650     | 14      | 29                      |
| <b>MONTREAL</b> .....                   | P. Bruchési.....       | 435,000   | 640     | 220                     |
| Saint Hyacinthe .....                   | M. Décelles.....       | 115,000   | 230     | 220                     |
| Sherbrooke .....                        | L. Larocque.....       | 67,000    | 140     | 140                     |
| Valleyfield .....                       | M. Emard.....          | 65,000    | 139     | 39                      |

On the death of a bishop, the bishops of the province send a list of three names to Rome and the Pope chooses and names a successor. The bishop-designate cannot be consecrated before receiving his bull from the Holy See. He enters immediately on his functions without having to fulfill any civil formality, and the diocesans render their homage and obedience as to his predecessor. The State recognizes in him the rights of a civil corporation. He enjoys besides, the greatest liberty while regarding canonical rules, in nominating vicars, creating parishes, erecting churches and parsonages. Each vicar keeps a registry of births, marriages and deaths. In French-Canada the vicar has the right of tithes for his maintenance. This tithe in spite of its name is but a twenty-sixth part; it is raised on grain alone, and the tendency is more and more to pay it in money. No vicar is irremovable.

(b) Religious Communities.—There are today in Canada more than 20 communities of men, eight of Brothers, and 62 of religious. They devote themselves to various forms of charity, of teaching, to parochial ministry or to preaching. They include Sulpicians, Jesuits, the Oblate Fathers of Mary the Immaculate, the clerks of Saint Viator, Dominicans, Franciscans, Redemptorists, the Fathers of the Holy Cross, of the Company of Mary, Eudistes, Basilians, of the Holy Sacrament, and several others. The Brothers of the Christian Schools to the number of 600, have 36 establishments, and instruct 20,000 pupils. The Sisters are to be found in every kind of devoted work: hospitals, asylums, industrial schools, almshouses, refuges, orphanages, in one word all the miseries that the crowded cities multiply find succor from them. Mention will be made only of the orders founded in Canada:

(c) Universities and Seminaries.—There are three Catholic universities in Canada: Laval in Quebec, Laval in Montreal, and the University of Ottawa, founded by Monsignor Guigues. The first two comprise all faculties except sciences. Medicine, law, and letters have well endowed chairs. Theology has distinctive faculties in the great seminaries of Quebec and of Montreal, the last opened by the Sulpicians in 1840. The University of Ottawa has only the faculties of theology and arts. Secondary education is disseminated by 17 colleges in the province of Quebec, all affiliated to Laval University which alone confers university degrees. Young men destined for the priesthood prepare by two years of philosophy and four of theology. This preparation begins in a great seminary; that of Montreal has nearly 300 aspirants for the priesthood, that of Quebec over 100. There is besides, one at Halifax; and each religious community of men is endowed with an academy where dogmatic and moral theology, the Holy Scriptures, Patrology, Canon Law, Church History and the pastorate are taught. Those young priests who are most distinguished for their intelligence are sent by their bishops to Rome to the Canadian College, founded by the Sulpicians in 1888, where they follow courses given by learned professors of the Roman universities and return with the

degrees of Doctors in Philosophy, in Divinity, or in Canon Law. Consult: Castelli Hopkins, 'Canada: an Encyclopedia of the Country,' Vol. V. (Toronto, 1898).

French-Canadian Catholics believe that they have been called by Providence to personate on American soil the rôle that France personated in the Old World. They look upon themselves as destined to fill a mission, and that mission the one that France has filled in Europe; to carry high the banner of the Catholic Church, and among races more inclined to positivism, maintain and propagate the instinct of disinterested devotion, and the worship of the ideal. Consult: Casgrain, 'Histoire de la Vénérable de l'Incarnation,' t. I. p. 95; Gailly de Taurines, 'La nation Canadienne,' ch. XXV, p. 280-291; Masson, 'Le Canada français et la Providence' (Quebec, 1875); P. Ragey, 'Une nouvelle France' (Paris, 1902).

A. FOURNET, P.S.S.

Professor in Montreal College.

**Roman Catholic Education.** See EDUCATION, ROMAN CATHOLIC.

**Roman Catholic Emancipation,** the abolition of those civil and ecclesiastical restraints to which the Roman Catholics of Great Britain, and particularly of Ireland, were once subjected. By the statutes of William III. Roman Catholics were forbidden to hold property in land, and their spiritual instructors were open to the penalties of felony, and although latterly these restrictions had not been enforced, they remained un repealed in England until 1778. See EMANCIPATION, CATHOLIC.

**Roman Empire, Architecture of the.** The ancient buildings of the city of Rome had little influence over the wealthy nobles, the provincial governors, the newly enriched generals of the later republic. The old Etruscan system of building, with much painted terra-cotta and with rude sculpture of a type which must have seemed to them very provincial and very archaic, too, when contrasted with the works of Greek civilization, could all be disregarded by men who had learned in the school of that civilization what the elegance, the finish and the perfect technique of Hellenic artists could produce.

Yet this influence is not to be avoided in view of the fact that all trace is lost of the republican buildings of Rome except some masses of the old Servian wall, the substructure of the tabularium and the like, which have kept their places by sheer inertia and on account of their immovable mass. The business of every Roman invader of the Eastern lands was to bring away as much artistical plunder as practicable, and on his return home to build great public monuments in the Imperial City itself as nearly in the Greek taste as he could. This again is an inference, but is irresistible in view of the abundant remains which we have of the period from 150 to 90 a.c., and of what is said about the period by its own writers. We have less power of judging of the buildings built in the provinces under Roman direction at this early period. Probably those buildings were not numerous nor often important. It was not until the civil wars had been closed and the peaceful administration of the empire was assured, first under the Dictator Julius, and

then under his nephew, Perpetual Tribune and Perpetual Prince of the Senate, Octavius, that Roman buildings, properly so called, because constructed in accordance with the central authority on the Tiber, appeared in the different parts of the Mediterranean world. It was in 54 a.c. that L. Æmilius Paulus began his great basilica at the northeast of the Roman Forum and intended as a second forum—an enlargement of the public space for the meeting of citizens. Julius (murdered in 44 a.c.) began his basilica, which was finished by Augustus, who also cleared away older buildings and built and adorned a new forum north of the Forum Romanum. The Forum of Augustus, with a triumphal arch, was more splendid than anything that had been seen in Rome. It contained the magnificent Temple of Mars the Avenger (Mars Ultor), and was enclosed by a lofty wall of solid cut stone masonry to shut off the humble dwellings to the north and east from the stately architectural group. The enormous *Septa Julia*, a larger basilica than any that had existed before, was built far to the north of the Capitol, in what was then the *Campus Martius*.

From that time on the emperors and the Senate vied with each other in the extent and magnificence of their buildings in the imperial city. These buildings were of two marked and easily distinguished classes. One class was Greek altogether in its tendencies, in the character of its construction and its design. It consisted of columnar architecture altogether, the construction being as simple as the Greek temples of earlier times. They were all of trabeated or post and beam construction, and always flat-roofed, always depending upon their colonnades for their chief architectural effect. The other class of buildings was of a nature never before seen in the world, and of unexplained origin.

It is very probable that the Alexandrian Greeks, that is to say, the Greek builders, under the successors of Alexander, and especially in the wealthy seaport city named after him on the shore of Egypt, invented this system of buildings, or rather developed it from the earlier practice of the Western Asiatics, especially the Persians of the later kingdom. This system of building was dependent upon vaulting in solid shells, either bricks or small stones being employed with what is called the "bath of mortar," that is to say, with mortar used in a semi-liquid condition and in great abundance. The result of this system of masonry is a solid, uniform, homogeneous shell, whether in walls or in the vaulted roof. It was taken over by the Roman builders at an early period of the rebuilding of the imperial city, and yet it is not ascertained at what period the earliest monuments of this style appeared in the city of Rome. It has been noted that Vitruvius, writing under the government of Octavius Augustus, never alludes to it. To him, the only writer on building of the time whose works have come down to us, building is as simple a matter as it was to a Greek; he seems to have understood only walls of brick or stone and roofs of timber. It is not possible to assert that any buildings of the character described above earlier than the Pantheon exist in Rome or in Italy, and the Pantheon as we have it, that is

to say, the cylindrical tower roofed with a low cupola 140 feet in diameter, and the largest structure of that kind in the world, is of the reign of Hadrian (117-138 A.D.). Once adopted however, this system of building prevailed immediately all over the empire, not universally, but as it seems, in the way of the officially recognized style of building whenever a spacious interior was required. And it is noticeable that this building for the interior is practically a Roman imperial invention. No Egyptian, no Babylonian or Assyrian, no Greek builder would have thought of making the interior the chief object of his care. The exterior of the monument was its essential characteristic; the interior, as is clear from the plans of the buildings, came of the necessities of construction without any serious attempt to modify them to the service of the requirements. The Roman engineer, on the other hand, desired vast halls, wide as well as long and high, and grappled with the problem of roofing these by means of masonry vaults, with a determined and seemingly unconscious courage unique in the history of the building art. Once he had developed the system of building the cylindrical or the spherical vault by means of stones laid in strong cement mortar, it seemed to be as natural to him to plan a width of 80 or 85 feet and to roof cylindrical towers nearly twice as wide, as to build the halls of more moderate dimensions.

These different systems of building were combined by the Roman engineers with extraordinary simplicity of means and with perfect success. Thus a massive wall built of squared blocks of stone without mortar exactly as would have been the practice in a Greek town four centuries earlier, would be backed up by a wall of mortar masonry. Bricks were used to face walls of solid masonry with such perfect success that those walls, of all thicknesses from nine or ten inches to many feet, were thought for years to be brick walls, although there is no such thing as an ancient brick wall in the city of Rome, and the solid mass of small stones laid in mortar and faced on either side with triangular tiles of clay exists even in the thinner partitions. Colonnades of marble shafts, capitals and epistyles were built in front of and flanking temples and palace halls, which were vaulted in the true Roman style with rubble laid in mortar, and these alternating with halls built and vaulted with almost equal boldness in cut stone as in the famous Nymphæum at Nîmes, in southern France. In making these combinations the Roman engineers were led inevitably to the mingling of their principles of design, and as they were not swayed by the strong logical and artistic sense of the Greek peoples they used this mingling of styles without perfect harmony. Thus a building of the most solid construction with all its openings spanned by arches and its roof made by a gigantic and ponderous vault would be adorned within and without by columns and entablatures, just as if the whole structure were Greek in the simplicity of its build. In later times separate columns were used to give a real or apparent support to the abutment of the vault. Thus in the great walls of the *Thermae* (see *THERMAE*) the groined vaults springing from nearly square piers are really supported by the walls themselves, from which the abutments project and

are supported generally in the way of corbeling: but in every case a gigantic column of Egyptian granite or similar precious material, with a capital of gilded bronze is put in to carry the line of the vault to the floor, and to give a seeming support even to that which needs none. This is the serious fault of the Roman imperial architecture, its denial in the decoration of the actual constructive nature of the work.

The Roman engineers did not look to the building itself for their final architectural effect. They used with the greatest freedom many kinds of surface decoration, ransacking the empire for splendid materials and using labor and money for the procuring of magnificent adornment. Thus a great hall in a public building would be lined with precious marbles in great slabs for the lower part of the walls; above this might come stucco surfaces modeled and embossed in reliefs of great beauty, such as those found in a tomb on the *Via Latina* near Rome, and very recently in a room in the *Farnese garden* near the *Tiber*. Above this again a similar finish in stucco would be carried out with deeply sunken panels and much gilding. The floor of such a hall would be of mosaic, and the pilasters, whether square or circular, and the great pilasters which backed the free columns, would be of the most costly material and in enormous blocks. It is not asserted, however, that the building was designed by one artist and the decoration by another. On the contrary, the original scheme provided for all the decoration which was to be added. It is this freedom of decoration combined with an elaborate study of the interior as the chief purpose of the building, that has made the Roman imperial buildings the models from which all more recent architecture has originated. A Greek temple would be of no use as a Christian church, or as a palace hall — as a place of meeting or as a shelter for many persons; but the Roman buildings, basilicas, palaces, *thermae*, and private houses, were all especially fitted to be lived in and otherwise used. The people of the West took the Roman buildings as they stood for churches and residences and buildings of state and official life; and as they built others, modified them from Roman practice only as their greatly diminished resources compelled them to do. A poor mediæval community could not build as a Roman proconsul built; the 6th century building had to be cheap and poor, with low, thin walls and a wooden roof: but still the Roman type was kept in view. In this way the Latin architecture of Italy, that of the earliest churches, took shape and was succeeded by the Romanesque (see *ROMANESQUE ARCHITECTURE*) for all of Europe except the Balkan Peninsula and the countries north of it. In the East another course was followed. The Roman civilization, and some part of the wealth and readiness to spend money which characterized the great empire, were retained in the empire of the East, and under these different conditions and with the powerful influence of Persia close at hand, the Byzantine architecture has lingered in the East until the present day, taking a different and generally inferior form in the hands of the Mohammedan race (see *SARACENIC ARCHITECTURE*), but preserving its original character where Greek Christianity has prevailed. In Western Europe, on the other hand, the

Romanesque architecture grew into Gothic; and the neo-Classical architecture followed in the 13th century, as a combination of the forms and structure which the Gothic art had made familiar to Europe, with a system influenced and largely controlled by the study of classical Roman art.

Of all the methods of architectural adornment, sculpture was the most remarkable; and the Roman architectural sculpture was a great contribution to the world's possessions of noble fine art. As early as the dictatorship of Julius, there existed in Italy a school of sculpture quite different from any matured by the Greeks. The great Altar of Peace, begun in 13 B.C. to commemorate the establishment of peace in the Mediterranean world, included a great amount of exquisite sculpture, both architectural and in the form of portrait statues. Under Trajan the art assumed a very dignified and truly architectural form, as in the reliefs of the Arch at Benevento and the still more admirable compositions preserved in the Lateran Museum at Rome. Under Marcus Aurelius large and showy reliefs recorded the transactions of his reign. The sculptures here named are all in marble, but the beautiful stucco reliefs must also be included in any examination of the sculpture of the 1st and 2d centuries.

**Roman Law.** The time of Justinian represents the beginning of Roman jurisprudence, for while laws had existed since the days of Romulus, it was during his reign and by his direction that civil jurisprudence was at last digested in the Code, the Pandects, and the Institutes.

Originally the government of Rome was in the hands of an elective king, a council composed of nobles and an assembly of the people. Matters concerning war and religion were administered by the supreme magistrate, and he alone had power to propose laws, his suggestions being debated in the Senate, and, finally, submitted to the several parishes of the city for ratification or

rejection. Among the most famous ancient legislators were Romulus, Numa, and Servius Tullius. It was to Romulus, for example, that Rome owed its first laws concerning marriage, the education of children, and the authority of parents; from Numa it obtained its law of nations and of religion, while from Servius came the civil code which balanced the rights and fortunes of the seven classes of citizens, and provided for the protection of contracts and the punishment of crimes. Later these laws were codified under the title of *Jus Papinianum*, but the work has long been lost, fragments only having been found by archaeologists.

Wise as many of these statutes may have been they were not destined to last for long, and when they became both odious and obsolete they were succeeded by the Twelve Tables, a digest that was received with such blind reverence for authority that all young Romans were compelled to commit it to memory. For centuries this stood as the "fountain of justice," and it is possible that there would have been no change for centuries to come if the new laws had not become such an intolerable grievance, permitting an almost complete divorce between law and equity. Conceived by the genius of Caesar, it remained for Hadrian to find the solution to the difficulty in the compilation of the code which, known as the Perpetual Edict, long remained the standard of civil jurisprudence in Rome.

During the four centuries that elapsed between the day of Hadrian and the reign of Justinian both public and private jurisprudence were molded by the will of the sovereign, and the custom of placing his decision on the same level as the maturely deliberate acts of the legislature resulted in the adoption of so many general and special laws that obedience might be said to have become an impossibility, until, at last, the question of the will of the sovereign was fixed by the framing of the Gregorian, the Hermogenian, and the Theodosian codes. The last named laws were compiled by a commission of eight persons appointed by Theodosius the Younger in 429, but were not published until 438, when they were established as substitutes for all the existing codes made since the reign of Constantine.

In A.D. 527, when Justinian ascended the throne, he found that the reformation of Roman jurisprudence was a labor that could no longer be postponed. During ten centuries the laws and the legal opinions that had become statutes were so numerous that they filled many thousand volumes, making it impossible for anyone to obtain, to say nothing of digesting, all of them. Judges were, therefore, often compelled to exercise their own discretion in the absence of any known law, while citizens in general were practically in absolute ignorance concerning the laws that governed them. The new Code, the Pandect, or digest, and the Institutes, or elements, were prepared by the most eminent scholars, who worked under the direction of Tribonian, a man whose versatility of knowledge can be compared only to that of Bacon. The entire compilation was completed in three years, and the ancient statutes were at once abandoned as relics of antiquity. This code was simply a digest of the previous codes of Gregorianus, Hermogenianus, and Theodosius, and the Constitutions, Rescripts, and edicts which had previously been issued, and is of importance in that it contains much ancient church history and law.

## ROMAN RELIGION—ROMANCE

**Roman Religion.** So composite was the body of the religious beliefs of the Roman people, and so complex the elements themselves of which this composition was formed that it is impossible to name any definite source from which it may have come. It consisted of a mass of mythological traditions and customs which may be traced back, in many instances, to several common localities. These beliefs were introduced from time to time by the various peoples who formed the successive accretions to the great Roman people, and who in every notable instance brought with them into the nation their national religious beliefs, contributing part of them at least to the permanent structure of the Roman religion. And yet there are certain native elements which may be regarded as distinctively Latin, while, on the other hand, these elements themselves are nearly always paralleled in some one, or even in several, of the foreign components. To the influence of the Greeks more than to any other people the Roman religion is indebted for its structure and general complexion. And yet it will be seen that it differed from that religion in fundamental, vital respects.

Regarding Romulus and his immediate successors as the primitive founders, it will be found that distinctive contributions from the Sabines were added to the beliefs of the early settlers, and these later supplemented by the Latin and the Etruscan. The host of lesser sources can not be stated with any degree of accuracy. As hinted above many of the Latin gods bear a striking similarity to the Greek—a fact accounted for by a common origin. Thus we have the Latin Saturn, god of seeds, fruition, akin to the Greek Kronos; and Ops, wife of Saturn and goddess of earth and plenty, akin to Rhea, wife of Kronos; Jupiter, and Juno, who might be related to the Greek Zeus. More distinctively Latin are the wood gods, Faunus and Fauna; Janus, Diana, the goddess of the hunt; Vesta, the goddess of the hearth (flame); Vulcan, the god of flame (the smithy); Fortuna, the goddess of fortune and of chance. The list is too long for enumeration. Deities which may be named as of Sabine origin are the war gods, Mars and Quirinus, the latter being more particularly a god of strife; Sol, Luna, and other gods of the heavenly bodies. Tellus, the god of the earth, was Latin, while Feronia, the goddess of the soil, was of Sabinian origin.

The Romans had a separate god, or more often sets of gods, for everything. Besides all the greater deities corresponding to the Greek beliefs there were gods and goddesses for all the lesser acts and conditions of life, for every material thing. Thus from their supreme representatives, Jupiter, Juno, and Minerva, to the Lares and Penates, the gods of the household, there was an endless procession of deities of every grade and power.

Worshipping at first directly and freely to these gods themselves the Romans maintained in their religious dealings with them a somewhat Norse-like independence. A god was to be worshipped for the good he would do one. Greater his return to his votary the greater the worshipper's respect and belief. The Roman struck a bargain with his god; for so much good done him he worshipped the god so much. If the god proved powerless the worship was withdrawn.

From this fine freedom in his religious belief, characteristic of the simplicity, the noble democracy, of the earlier days of the Roman people, there grew, coincident with the luxurious decadence of the empire, grave abuses which finally corrupted the entire tissue of the religion. There had been no priests at first. Only the fewest and simplest of attendants were devoted to the service of the gods. But gradually there were continual additions to these, until during the last days of the empire all that remained of the former religion was the groveling superstitious mysticism, zealously kept alive by avaricious priests, who levied for existence on the popular prejudices, debased morals, and superstitious fears. It was against such a state as this that the Apostle Paul took up his labors and against which Christianity finally prevailed, the last official recognition of the old beliefs going down under the proclamation of Constantine the Great, whereby the Christian religion was declared to be that of the state (312 A.D.).

**Roman Steelyard.** See BALANCE.

**Roman Walls,** four great walls built by the Romans in Great Britain. The first of these stretched from the Frith of Forth to the Frith of Clyde. It was built by Agricola in 80 A.D. In 83 he strengthened it by another wall, and in 139 Lollius Urbicus again built over the same ground, the wall being known as the wall of Antonius. These walls were built to keep back the northern barbarians, who in the forms of Picts and Scots continuously menaced Roman rule in Britain. Hadrian, concluding that the walls of Agricola were insufficient for this purpose, built in the early part of the 2d century the famous wall that stretched between Newcastle on the Tyne and Solway. This wall, finished in 120 A.D., was 68 miles in length, and marked the northernmost limits of Roman territory in Britain after that date. It is known as the wall of Severus, since that ruler strengthened it in 209 by building a parallel wall a few yards above it. Consult Bruce, 'Roman Walls' (1855).

**Romance,** a fictitious narrative in prose or verse, the interest of which turns upon incidents either marvellous or uncommon. The name is derived from the class of languages in which such narratives in modern times were first widely known and circulated: these were the French, Italian, and Spanish, called the Romance Languages (q.v.). The treatment here given must omit any extended mention of certain isolated romances in the later Greek. A well-known example of such is 'Apollonius of Tyre,' at one time widely read in the west of Europe; transmitted to England, first probably in a Latin version, it was soon translated, and was employed by Shakespeare for the plot of 'Pericles, Prince of Tyre.' Nor can the limits of the subject admit of discussion of some few Latin works sometimes classed as romances, such as the 'Golden Ass' of Apuleius, of which use was made in 'Don Quixote' and 'Gil Blas.' For such, see articles on individual titles and authors, and the general articles on the Greek and Latin literatures. For general consideration the subject may be restricted to the Middle Ages. The finest of these romances still extant are of the 12th and 13th centuries. They may be divided into two classes—the popular epic

(*chansons de geste*) chanted by the jongleurs and other strolling minstrels; and the more elaborate and artificial poems composed by trouvères and recited before aristocratic audiences.

The materials of both classes were more ancient lays of celebrated heroes, mingled frequently, especially in the German romances, with pagan myths, together with long connecting passages composed by the minstrels themselves. Hence originated a series of epics grouped around some renowned hero, and forming a cycle of romance. To the first class belong the German heroic poems and the Carolingian chansons; to the second the Arthurian legends.

Of the collection of the ancient German lays made by Charlemagne, nothing remains except perhaps the fragment of the alliterative 'Lay of Hildebrand,' now in the Cassel Library. It is supposed to have been written in the 9th century or even earlier. All the other manuscripts of German heroic poems are of much later date; none of them are earlier than the 13th and most of them belong to the 14th or 15th centuries. Of the 'Nibelungenlied' (q.v.) there are three copies belonging to the 13th century. In this epic Dietrich plays an important part; but the poems devoted to the simple Dietrich legend are only found in late transcripts or early printed editions, probably little later than the date of their actual composition. They represent, however, older lays, and these again still older, of equal or even greater antiquity by two centuries or more than the Cassel fragment. The language changed considerably in the course of these centuries, and the poems must have been entirely recast, rhyme being substituted for alliteration; but the change in the legend itself is immaterial. It can be traced in the Latin chronicles of the 10th and 11th centuries, and also by means of the 'Vilkina Saga,' an Icelandic prose work of the 13th century. These poems, as well as others on similar subjects, range from a few hundred to several thousand lines in length. Some of them were modernized by Caspar von der Röhn, and inserted in his 'Heldenbuch.' The completest collection is that in Heinrich von der Hagen's 'Alteutsche Heldenlieder' (1855). Another poem closely connected with the Nibelungenlied is the Latin epic of Walter of Aquitaine, attributed to Ekkehard I., abbot of Saint Gall, who died in 973, and is said to have written it as an exercise in his youth. It is obviously a translation from a German poem, and is found in several manuscripts, none of them perhaps older than the 12th century. The 'Klage' ('Lament'), said by W. Grimm and others to be a poem of the 12th century, forms a sort of conclusion to the great German epic; and another poem, 'Biterolf,' is ascribed to the same unknown author. It extends to 13,000 lines, and contains a great number of daring adventures, in the course of which Dietrich encounters and vanquishes Siegfried. 'Gudrun' is a fine epic of nearly 7,000 lines, and is of not much later date than the 'Nibelungenlied.'

We can only mention the names of the poems which make up what has been called the Lombard sub-cycle, namely, 'König Ruther,' 'Wolfdietrich' (including 'Hugdietrich'), and 'Otmit,' which latter furnishes the materials for the French poem 'Huon de Bordeaux.' Frederick Barbarossa was a great admirer of Charlemagne, and collected all the accredited records of that

monarch. He patronized the minnesingers as the German representatives of the troubadours. At his great Mainz tournament were assembled not only the knights of Germany and France, but the poets also. Among those present was Heinrich von Veldeke, who imitated the 'Roman d'Eneas' in his 'Eneit,' an example quickly followed by the chief leading epic poets of Germany. Heinrich completed his poem at the Wartburg, the residence of Hermann, landgrave of Thuringia; and many other translations, among others that of the 'Roman de Troie,' were executed there shortly afterward. Another guest of the landgrave's was Wolfram von Eschenbach, author of 'Parzival.'

The *chansons de geste* form an interesting body of literature. The oldest of them are of great length, consisting generally of 20,000, 30,000, or even as many as 50,000 lines, grouped in sets (*tirades*) of from 20 to 200 lines, all ending with the same assonantal rhyme. Up till the middle of the 12th century the lines were of 10 syllables, but lines of 12 syllables, ending in consonantal rhymes, were gradually substituted. The romances were sung to the sound of a kind of violin (*vielle*), played with a regular bow. Many of the minstrels (*jongleurs*) were poor, wandering on foot from village to village, singing in the ale-houses, or at the public fairs and games; some were soldiers, such as Taillefer, who struck his first blow at Hastings. Later they became mere mountebanks. A number of them wrote their own chansons, while others bought them from their original authors, and adapted them to the taste of their audience. When a jongleur had thus procured a copy he took care to conceal it from his rivals. A few of such copies, little weather-beaten volumes, are still preserved, a noted example being the Oxford manuscript of the 'Chanson de Roland.' It was to the poets of northern and central France rather than to the troubadours of Provence that these poems were due. The *chansons de geste* are divided into three cycles—that relating to Charlemagne and his peers, the Arthurian, and the classical. The more antique the Charlemagne romances are the more they are devoted to the emperor, who is represented more as a majestic king and valiant knight than as the statesman we recognize him in history to be; at times he is depicted as being easily duped, avaricious, and capricious. Among such works are 'Girard de Viane'; 'Fierabras' or 'Fierabraz'; and the 'Chanson de Roland.' The centre of the entire structure is the 'Arthurian Cycle.' In the lays of the Welsh bards, supposed to be as old as the 6th and 7th centuries, although no manuscript extant is of earlier date than the 12th century, Arthur and his companions are celebrated, but temperately, the element of the miraculous being absent. It is in the 'Historia Britonum' of Abbot Nennius (apparently written in Welsh in the 8th century, and translated into Latin afterward) that the legendary additions begin to develop. Of three or four centuries later date are the so-called 'Armorican Collections' of Walter, archdeacon of Oxford, from whom Geoffrey of Monmouth professes to translate, and in which the supernatural and marvellous elements largely prevail. The 'History' of Geoffrey was versified in French (1155-8) by Wace, a son of one of the Conqueror's followers. The 'Brut,' as this met-

## ROMANCE LANGUAGES—ROMANCE OF THE ROSE

real setting is called, contains about 15,300 eight-syllable lines, and adds a few details to the story of Arthur which do not seem, however, to have been Wace's own invention. The work was translated into English, and further amplified, by Layamon, about 1204. The 'Brut' of Layamon is composed of nearly 32,250 alliterative lines, or rather half lines. One of the most prolific of the Arthurian poets is Chrétien de Troyes (born about 1140).

One of the finest of the early French Arthurian romances 'Tristan' or 'Tristram,' was adapted by Gottfried of Strasburg, who left his 'Tristan und Isolde' slightly incomplete, about 1210. Other poems belonging to the cycle are the 'Morte Arthur,' a fine alliterative work of the 14th century; a Latin 'Life' of Merlin, in 1,529 hexameters, written about 1217; 'Li Biaus Desconneus,' a narrative of the adventures of Gligain, son of Gawain, written by Renauld de Beaujeu about 1200, and imitated by Wirnt von Gravenberg in his 'Wigolais' (about 1212). From France the Arthurian romance spread also into Provence, Spain, Italy, and the Netherlands, and was again transplanted into England.

The last of the cycles are the *classical*, in which the subjects are Alexander the Great and the Trojan heroes. The materials for the Alexandrine poems were found in an old Greek romance, written in Alexandria between 100 and 300 A.D., and known as the 'Pseudo-Callisthenes,' which was long read as authentic history, and of which there is still extant two Latin abridgments belonging to the 9th and 10th centuries. The most important romance on this subject is 'Le Romans d'Alexandre,' written by Lambert li Tors and Alixandre de Bernay in the 12th century; it contains upward of 20,800 12-syllable lines. This was the chanson that established the whole sub-cycle, and first brought the Alexandrine line into vogue and gave it its name. It concludes with the testament of Alexander and the lamentations of his 12 peers. Many French poets continued the subject. See also FICTION.

**Romance, or Romanic, Languages,** those modern European languages which owe their origin to the language of ancient Rome—the ancient spoken language, not the language of classical literature. The common or vulgar speech of the ancient Latin peoples, the *lingua rustica*, differed as widely from the language of Cicero, Virgil or Livy as does the dialect of Yorkshire or of the Scottish lowlands from the literary English of to-day: it had in a measure its own vocabulary, its own pronunciation, its own grammar and prosody. This vulgar tongue was in fact the primitive Latin speech before Latin began to be used for literary purposes, and some of the widest differences between classic Latin and the modern Romanic languages are discovered existing in the extant remains of archaic Latin speech. A glance at a page of literary Latin is enough to convince any one of the frequency of such terminations

of words as *us, um, am*, etc., none of which are ever seen in Italian or Spanish: in the most ancient specimens of Latinity that exist the final *s* and *m* are very frequently dropped; and there is strong reason for the inference that in common speech, even in classical times, not only *s* and *m* but other consonants—*t, d,* and *r* were either dropped or feebly pronounced: this is what we see in the French language. Again, words in common use among the early Romans, but which were obsolete in the Augustan age, reappear in the modern Romanic languages: examples: in ancient Latin speech *bucca* signifies mouth, but in literary Latin it signifies the puffed-out cheek: in the modern Romance languages the word derived from *bucca* means mouth; *minacia*, obsolete in the Augustan age, is revived in Italian, French, English, etc. (*menace*); obsolete *vitellus* reappears in French *veau*, English *veal*; *caballus*, nag, is the original of the word for horse in French, Spanish, etc. Though obsolete as regards literary use, such words lived on in the vulgar speech and so became current in the language of the Roman colonies everywhere. But this *lingua rustica*, called also in the Middle Ages *lingua romana*, to distinguish it from literary Latin speech, underwent great modifications and changes when it became the common speech of the Gallic, Germanic or Slavic peoples among whom it was introduced by the Roman conquerors, or who adopted it after they had overturned the Western empire. Thus arose the modern Romance languages, which are chiefly seven, namely: Italian, Spanish, Portuguese (with which is usually classed the Gallego, or language of Galicia), Provençal, French, Ladino (or Romansch) and Rumanian: the dialect of the Catalans is regarded as the southern Provençal: in all of these Romanic languages except the Rumanian, the principal foreign element is Germanic or Gothic: in the Rumanian language it is Slavonic.

**Romance of the Rose**, a celebrated allegorical poem, one of the most important literary compositions of the Middle Ages. It consists of two parts, the first part, comprising about 4,000 verses, was written before the middle of the 13th century by Guillaume de Lorris, and the other some 50 years later by Jean de Meung: this contains nearly five times as many verses as the first part. It is a poem of love, but it is also a satire on contemporary manners and a curious repertory of miscellaneous erudition. Guillaume de Lorris, in the introductory lines of the poem professes to set forth the whole art and mystery of Love in allegory, and the Rose is "the sweet guerdon of love": but commentators were pleased to give this not very obscure intent of the poet a mystical turn, and interpreted the Rose as signifying the divine gift of Wisdom, or the soul's state of Grace, or the state of Eternal Bliss, or even the Virgin Mary. The commingling of allegorical romance with social and political satire, history, science, economic theory, and in short with such encyclopædic erudition as existed in that age, offends the modern literary taste and is exceedingly tedious reading; but it suited exactly the taste of its time, and for more than two centuries was a classic.

## ROMANES.—ROMANESQUE ARCHITECTURE

**Romanes, rô-mân'ez**, George John, English scientist: b. Kingston, Canada, 20 May 1848; d. Oxford 23 May 1894. He was graduated in 1870 from Caius College, Cambridge, in 1874-6 worked under Burdon Sanderson in the laboratory of University College, London, and carried out important researches in nervous excitability. In 1879 he was elected fellow of the Royal Society, and in 1878 published, under the pseudonym 'Physicus,' a work entitled 'A Candid Examination of Theism,' in which he took up a somewhat defiant atheistic position. Subsequently his views underwent considerable change; he revised the 'Candid Examination,' and toward the close of his life was engaged on 'A Candid Examination of Religion,' in which he returned to theistic beliefs. His notes for this work were published after his death, under the title 'Thoughts on Religion,' edited by Canon Gore. Romanes was an ardent supporter of Darwin and the evolutionists, and in various works sought to extend evolutionary principles to mind, both in the lower animals and in man. He wrote very extensively on modern biological theories. His chief remaining works are: 'Animal Intelligence' (1881); 'Scientific Evidences of Organic Evolution' (Nature Series, 1882); 'Mental Evolution in Animals' (1883); 'Jelly-fish, Star-fish, and Sea Urchins' (1885); 'Mental Evolution in Man' (1888); 'Darwin and after Darwin' (1892-5); 'Examination of Weismannism' (1893); 'Mind and Motion, an Essay on Monism' (1895). In 1896 appeared a volume of 'Essays,' a selection from his 'Poems,' and his 'Life and Letters.'

**Romanesque Architecture.** The term is applied to any style which is assumed to have grown up immediately from the attempt of mediæval people to build as the Romans of the empire built: but it is generally used for the round-arched styles of Central and Western Europe, from the 6th to the 12th century, and as excluding the Byzantine style of the Balkan Peninsula. It is also very common to exclude the earliest Christian churches of Italy (see **BASILICA**; **CHRISTIAN ARCHITECTURE**). The word Romanesque is not very ancient, and its original meaning is rather "romantic" or "fantastic": but it was applied to architecture in imitation of the French use of the term *Roman* (fem. *Romane*), which was introduced into architectural terminology about 1835, and exactly in this sense, that is, to denote the pre-Gothic, round-arched architecture of Western Europe. Previous to that time the English writers had applied the word "Norman" to all round-arched English buildings except those few which they supposed to be of pre-Norman origin, and which they called "Saxon" or "Anglo-Saxon"; and as for the architecture of the Continent, such terms as "Lombard" and "Early Italian" were used, also "French Round-Arch" style, "German Round-Arch" style, and the like, or, in imitation of the German writers, "Byzantine," even when applied to buildings in the North. The term Romanesque is said to have been proposed by William Gann, a clergyman and antiquarian, who died in 1841. It was taken up by better known writers, such as Whewell and Benjamin Webb.

The characteristic of the Romanesque style is the almost universal employment of the round

arch, and of constantly repeated attempts to use arched construction also in roofing churches and palace halls. The history of building in France and Germany from the 9th to the close of the 12th century is a constant series of attempts to vault wider and still wider aisles and naves, and the constant failure of those vaults, which either fell in ruins or needed to be tied and braced afterward in different ways. This came largely from the inferior mortar which was used, but, in general, from the poverty of resources of the small communities, secular and religious, and of the barons and princes of the time. Very little power of employing skilled labor existed, nor was there much skilled labor to engage; and, moreover, the means of transport were extremely inadequate, so that stones, however unfit for the purpose, had to be taken from the nearest quarry, and mortar had to be made up of such materials as were readily at hand. From this inadequacy of resources comes the constant use of heavy walls and deep-set windows, which in turn add a peculiar charm to this style. The church buildings might have been more permanent but for the constant attempt of the builders to raise the clearstory walls high above the aisle roofs, in order to secure large windows in the clearstory for the lighting of the whole interior. The higher these clearstory walls were made the more dangerous was the vault which they were to carry, and this because of the comparative difficulty of buttressing that vault when it reached a considerable height. There was also the desire to terminate the church at the east end with one or more semicircular apses, and as the churches grew larger and the aisle to be carried around the apse concentric with the inner and higher semicircular compartment, the difficulty of vaulting this aisle became almost insuperable. It was out of this twofold necessity that Gothic architecture arose, the startling innovation of the vault depending upon the ribs for their security having changed all the conditions of the problem (see **GOthic ARCHITECTURE**).

Romanesque architecture lingered the longest in Western Germany because magnificent cathedrals had been built and were building along the Rhine in this style. The cathedrals of Mainz (Mentz, Mayence), of Speyer (Spire, Spires), Trier (Trèves), and Worms, and the great churches of Saint Michael at Hildesheim, and, at Cologne, of Santa Maria, in Capitolio, of the Apostles, and of Saint Martin, show a magnificent and complete system of church building founded on the round arch and on cylindrical vaulting, which had a strength sufficient to resist the Gothic innovation for a long time. In Central France there remains a whole series of churches roofed by cupolas circular in plan, rising from square compartments by means of pendentives. This type must be thought to have come from the Byzantine through Venice; there belong to it the cathedral of Angoulême, and the churches of Gensac, Roulet, Souillac and of Saint Front at Périgueux, which last, however, has undergone a ruinous restoration. Further south is the cathedral of Le Puy (Puy-en-Velay), a round-arched church of great beauty and picturesque effect: but indeed the whole centre of France contains churches of this character, either perfect or in a much altered state.

The especial glory of the French Romanesque is in its exquisite sculpture. Such churches as the Abbey Church at Vézelay, the cathedral of Angoulême, the Church of Notre Dame La Grande, at Poitiers, and in the South, Saint Trophime at Arles, and the never finished church at Saint Gilles, display a wealth of sculpture unequaled at the time and never approached in its value as architectural decoration except by the Gothic sculpture of the next century. There is also a curious use of polychromatic effect in the external walls at this period. Especially in the centre of France a kind of mosaic of sandstone of different colors is used freely in large parts of the church; a good example being Notre Dame du Port at Clermont-Ferrand.

The Romanesque of Italy is represented by such admirable churches as San Zeno at Verona, San Miniato on the hill near Florence, the remarkable cathedral at Modena and, for the latest period, Sant' Ambrogio at Milan and San Michele at Pavia. There are also several superb Romanesque churches at Lucca, including the cathedral; and at Pistoia, north of Florence, three most interesting churches adorned with horizontal bands of black and white. This system of coloring is rather common, and is retained until the later or Italian-Gothic period. These churches are sometimes as rich in sculpture as the French buildings of the same period.

In England the style is far less elaborate and rich, but has an especial charm for those who know the long nave of Ely, the transept of Winchester and the nave of Peterboro Cathedral, or the admirable round church of the Temple in London and that of the Chapter House at Bristol.

The Low Countries are not rich in Romanesque architecture, but Belgium possesses in the Cathedral of Tournai one of the most magnificent Romanesque churches of which we have any record. The choir indeed has been rebuilt in a later style, but the crossings remain complete, with four lofty towers surrounding a central spire-like roof and a long nave with two stories of round arches.

RUSSELL STURGIS.

**Romanino, Girolamo, jê-rô-lâ'mô rô-mâ-nô'nô,** Italian painter: b. Brescia about 1485; d. there 1565. He was a pupil of Feramola in Brescia and between 1509 and 1513 lived at Padua and Venice, where he studied the rich golden coloring of Giorgione, and learned the art of reproducing it in his own works. After completing (1519-20) four frescoes in the cathedral at Cremona, he returned to Brescia. All his pictures are remarkable for their skilful composition and splendid coloring, but in his

later works his tones become silvery, clear and cold and lose the warm lustre of Giorgione's sunset tints. He painted many altar-pieces, of which the most remarkable are 'Madonna and Child' and 'The Madonna with the Dead Christ' (in Berlin Museum); 'Adoration of the Infant Christ' (in the London National Gallery, a good example of this painter's manner); 'Nativity' (in the Church of San Giuseppe at Brescia); and an 'Assumption' (in the Church of Sant' Alessandro, Bergamo). He also painted some frescoes in the castle of Malpaga, near Brescia, the home of the famous Colleoni, the commander of the Venetian armies. There are some fine portraits by Romanino to be seen at Brescia.

**Romanoff, rô-mâ'nôf,** the name of the reigning family in Russia, founded by Michael Feodorovich Romanoff: b. 1598; d. 1645. He was descended through his grandmother from the family of Ruric, the founder of the Russian empire, and came to the throne in 1613 by election of the boyars and the higher clergy. The early part of his reign was troubled by the Poles and by turbulent nobles. Western civilization gained an entrance into the country, and many foreigners, particularly Scotchmen, became naturalized. France tried to disturb the commercial monopoly of England in Russia. Michael was succeeded by his son Alexis and the male succession of the Romanoff family continued until the death of Peter II. in 1730, when the crown devolved upon Anne, Duchess of Courland, and continued in the succession of the female Romanoffs until the death of Elizabeth in 1762. The latter was succeeded by her nephew, the son of the Duke of Holstein-Gottorp, who ascended the throne as Peter III. and established the present dynasty of Romanoff-Oldenburg.

**Romans, Epistle to the,** one of the epistles of Saint Paul, the genuineness of which is as a whole undisputed, though the last two chapters have been suspected by some critics to be spurious. The Romans to whom it is addressed would seem to have been mostly Gentiles converted from heathenism to a judaizing form of Christianity. It is plain from the epistle itself that these judaizing Christians, whether of Jewish or Gentile blood, were already separated from the strictly Jewish community settled in Rome. The epistle was written from Corinth just before the year 58 A.D., which was the beginning of Paul's captivity. The argument of the Apostle is directed against the efforts of some teachers in the Christian community at Rome to enforce on the Gentile believers the obligations of the Mosaic law. These Judaizers maintained that to abandon the law was to proclaim license to sin: to which Paul replies that the sole and sufficient law of Christians is that they shall lead a new life in fellowship with Christ: this fellowship makes the new life possible: the law only commands, but gives not strength to obey. The argument is so full of allusions to and quotations of the Jewish law, both moral and ceremonial, that in the opinion of many critics those to whom the epistle is addressed must have been, not Gentiles, but Jews by race: hence the suspicion entertained regarding the genuineness of the last two chapters, in which it is plainly implied that the majority

## ROMANTICISM

of those "Romans" were indeed Gentiles, not Hebrews.

**Roman'ticism.** The word "Romantic" is derived from the old Romanic or Romance languages, which were formed by a fusion of Latin as spoken by the common people of Italy with the native tongue of the northern barbarians who invaded that country. This Romance speech naturally assumed a variety of forms, but it reached its highest development in Provence, in southern France, where it became an important instrument of popular literary expression, especially during the 11th and 12th centuries. The compositions which appeared in this vernacular tongue were generally tales and ballads in which the adventures of knights in pursuit of honor, or in devotion to the Christian religion, or the enthusiastic deeds of chivalry, and the spirit of loyalty and reverence for women were portrayed. Another mark of this literature is the evident fondness for events that are strange, mysterious, and supernatural. The name "romance" then, first applied to the language in which those compositions were written, came afterward to refer to the prevailing characteristics which they displayed, as contrasted with the works written in Latin, which were termed "classical." During the 18th century, which delighted to term itself the "Augustan Age," and prided itself upon its purity and refinement of taste, the classical models and modes of expression were regarded as furnishing the only correct standards, while the literature and art of the Medieval Period was regarded as barbarous, and the whole mode of thought and life to be characteristic of Dark Ages that were unworthy of the attention of a cultivated man. At the close of this century, however, and during the early decades of the 19th, a marked change manifested itself in the whole tone and tendency of the intellectual life of the time. This mental revolution, which is known as the Romantic Movement, affected all departments of thought, and all artistic and literary standards and modes of expression. From the first this movement showed a consciousness of its opposition to the generally received intellectual conceptions and prevailing artistic and literary standards of the time, though this contrast was less violently emphasized in England than in Germany and France. Goethe noted and commented upon the difference between the old tendency and the new, describing it as equivalent to that between the "diseased" and the "healthy"; while Schiller contrasted them as the "naïve" and the "sentimental." It was Friedrich Schlegel who first employed the terms "classic" and "romantic" to characterize this opposition. Since that time many writers have undertaken to define and explain the fundamental distinctions between these tendencies, especially as they express themselves in art and literature. The following points appear to be most significant: (1) The main marks of classicism are simplicity, directness, and nobility and perfection in achievement. In a classic work of art, there are no evidences of a lack of harmony between the ideas and the medium, no suggestion of something remaining that cannot be expressed. As a consequence, the personality of the artist is not expressed, the artist is lost in his work, which stands impersonal and objective. He does not show us his own attitude toward the subject-matter, his emo-

tional struggles and the play of his life. The Romanticist, on the other hand, puts himself into his work; it is no disembodied idea of beauty that he seeks to express, but his own personality, the longings, hopes, and ideals of a spirit that has a tendency toward the infinite, and which therefore can never express itself in any finite and objective medium. Classicism is thus always definite, objective, and complete, while Romanticism is always touched with subjectivity, and thus with a suggestion of incompleteness, which is due to the fact that it seeks to convey the mystery of spirit for which no objective mode of expression is adequate, and which therefore can only be symbolized and vaguely suggested. (2) As Romanticism endeavors to express what is strange and mysterious in the life of spirit, it naturally seeks its material in the past, and feels itself especially in sympathy with the Middle Ages, when the aspirations of the spirit, its love of adventure, and sense of the mysterious expressed themselves in quests for the Holy Grail, in crusades, and gallant deeds of chivalry and knight-errantry. Thus a sympathy with the past, a new interest in humanity as such, marks Romanticism. (3) Just because classicism sought to express the idea of beauty in definite and objective form, it was possible to lay down fixed canons of procedure and so to render the result formal, precise, and almost mechanical. Romanticism, however, aims to represent what is inner and subjective, and therefore necessarily protests against making art stilted and formal by the application of external rules and mechanical standards. Art, the Romanticists declare, must spring from the untrammelled expression of the free spirit of the man of genius. "The will or caprice of the poet," as Schlegel says, "admits no law above itself."

**The Romantic Movement.**—The romantic movement may best be understood if we regard it as a part of the general intellectual revolution of the 19th century, and as one in spirit with the historical and scientific spirit of modern times. The entire spiritual attitude of modern life, as contrasted with that of the 18th century, may be characterized as a new consciousness of infinite possibilities and boundless aspirations. The spirit knows itself as infinite, and is also conscious of the infinite task set for the individual through its own demand for expression and realization. The new tendency turns away in disdain from the mechanical conceptions and formal syllogisms in which the 18th century had self-complacently summed up the universe, it laughs to scorn the unintelligent and formal imitation of classical models that bases itself on ancient canons; it denounces the ethical principle of prudence; it declares that the infinitely mysterious law of life cannot be comprehended by the principle of self-love; it refuses to believe in a transcendent God. The new movement is thus romantic through and through, filled with a sense of mystery and wonder, with the love of adventure and discovery, and with the buoyant spirit of aspiration. As Wordsworth says: "In that dawning age 'twas bliss to be alive, but to be young was very heaven." This tendency to advance to new achievements manifested itself in many and various directions. In philosophy, it led to a new and fruitful attempt to comprehend in more adequate terms

God, nature, and the place and significance of man's life in the universe. The result of this is seen in the systems of Kant and the German idealists. On another side, the new interest in man and the affairs of man's life has given rise to the modern historical movement which has made its influence felt in every department of intellectual life. It is this historical interest, united with the Romantic spirit of adventure and discovery, that is the assertion of the confidence of Reason in itself, that has called into being the evolutionary sciences of nature. The concept of evolution has transformed the older view of nature, just as it did our view of man when it was earlier applied to illumine his social, ethical, and religious life. For evolution is just an attempt to explain the world by showing the relations between things as parts of a single process. It therefore always emphasizes organic relationships, and views things as parts or stages in a dynamic process, instead of taking each thing as something static, which exists in isolation as something in itself independent, and having only external relations to other things. The Romantic movement in art and literature must also be regarded as an expression in different fields of essentially the same intellectual and spiritual attitude that is shown in these other spheres of activity.

*Romanticism in England.*—In England a new spirit was perceptible in literature soon after the middle of the 18th century. This new movement, however, was not so intense or so fundamental in scope as its counterpart in Germany, which began a little later. For the introduction of a natural literature into England, expressing a sympathy with nature and an interest in the past, while disregarding the rigid canons of the Augustan Age, was in a way but the restoration of the healthy natural traditions that had expressed themselves in Chaucer and Spenser, in Shakespeare and Milton, and in the folk-songs and ballads, which were collected and edited by Thomas Percy in his 'Reliques of Ancient English Poetry,' in 1765. It was thus not marked by the keen sense of opposition to the prevailing system that characterized the tendency in Germany, and at a later time, also in France. Moreover, perhaps for this very reason, it did not penetrate so deep into the spiritual life of the people, or show its effects in all departments of intellectual life, as in Germany. It appears mainly as a literary movement, with which is connected some new tendencies in painting, and also as a revival of interest in Gothic architecture, which Horace Walpole did much to promote. But the movement did not involve a fundamental transformation of philosophical and scientific conceptions. This transformation came about at a later period during the 19th century, and was largely the result of the influence of German thought as represented by Coleridge and Carlyle, aided by Darwin's discovery and applications of the doctrine of evolution. The names of Gray, Cowper, and Burns, are usually placed among the English Romanticists, as well as those of Wordsworth, Coleridge, Southey, Byron, Shelley, and Keats. A little later we have the revival of interest in Dante, which culminates in the Pre-Raphaelite movement.

*The Romantic School in Germany.*—Lessing stands as the first to challenge the canons of the classic art and literature. Herder is at

once the pioneer of the modern historical method, and one of the first to appreciate the value of what is natural and spontaneous in literature. Influenced no doubt by the publication of Percy's 'Reliques,' he made a collection of the folk-songs of Germany. In Goethe's 'Werther' and Rousseau's 'Confessions' we have two books of nearly the same date that show many of the marks of extreme Romanticism. The name of 'Romantic school,' however, is usually applied to a group of men whose main centre of activity was first at Weimar and Jena and afterward to some extent at Berlin and whose work extends from about 1775 or '80 to 1806. The main names of this school are the brothers Friedrich and A. W. Schlegel, the philosopher Schelling, Novalis (whose real name was Friedrich von Hardenberg), Ludwig Tieck, and the theologian Schleiermacher. The main result of this movement was philosophical and æsthetic, though it led to some important results in the way of historical investigations. Another group of men—Umland, the brothers Grimm, von Arnim, J. Görres and Brentano, who represent a more distinctly literary movement with strong national characteristics—are often called the younger Romanticists, whose centre of activity was at Heidelberg, where their organ, the 'Zeitung für Einsiedler,' was published.

*Romanticism in France.*—We have seen that Rousseau may in a sense be called one of the earliest Romanticists. As a result of the Revolution and the prolonged Napoleonic wars, literature received little attention in France during the years that were most fruitful in Germany and England. Chateaubriand and Mme de Staël are sometimes said to be the forerunners of Romanticism in France. But the tradition of classicism was strongly entrenched, and even Victor Hugo at first adhered to this standard. But in 1826 in the 'Odes and Ballads,' and in the following year in the preface to the play entitled 'Cromwell,' he declared his allegiance to Romanticism, and at once became the leader in a new cause into which he threw himself with all the fervor of his enthusiastic nature. Besides Hugo, the principal French Romanticists are Alf de Musset, Ch Nodier, George Sand, Th. Gautier, and Balzac.

J. E. CREIGHTON,  
Professor of Philosophy, Cornell University.

Romanus I., rō-mā'nūs, Loospenus, Byzantine emperor; d. Island of Protea 948. He served in the imperial navy, and was in command of the Byzantine fleet on the Danube in 917, when hearing of the defeat of the army at Achelous,

he at once set sail for Constantinople. His designs on the throne were furthered by his popularity with his sailors and the people, and after the marriage of his daughter, Helena, to Constantine VII., he rose steadily in power, and in 919 was crowned colleague with his son-in-law. He exercised so much influence over the latter as to make him the real ruler until 944, when Constantine, aided by the sons of Romanus, caused him to be carried off to the island of Protea, where he was forced to become a monk, while Constantine was proclaimed sole emperor.

**Romblón**, rōm-blōn', Philippines. (1) A province consisting of a group of islands in the Visayan Sea, lying east of Mindoro and south of Luzon, they are near the centre of the archipelago, and the most northern islands of the Visayan group; area, 515 square miles. The northern islands of the group form with the islands of Mindoro and Marindique clear, deep channels, much frequented by Philippine boats; the islands are also indented with well-sheltered inlets and bays. The majority of the inhabitants of the province are Visayans; some Negritos are found on the island of Tablas, and Manguanes in Tablas and Romblón. Civil government was established in 1901. Pop. 55,339. The islands constituting the province are as follows: (a) Bantón, the most northerly island of the group; the surface is rugged except in the south-east; the soil is sterile, and few crops are raised; the chief industry is the mining of gypsum, an excellent quality of which is found; area, 11 square miles; (b) Carabao, the most southern island of the province; its chief physical characteristic is a central cone-shaped summit, from which the land slopes regularly to the sea; it is heavily wooded, but not inhabited; area, 19 square miles; (c) Dos Hermanas, two islets of rock, separated by a channel two miles in width; area, one square mile; (d) Maestre de Campo, the most western island of the province; it is circular in shape, and mountainous with steep shores; it contains one small village on the east shore; area, three square miles; (e) Romblón, the third island in size, giving its name to the group on account of central location and mineral wealth; (f) Sibuyán, the second largest and most eastern island of the group (see SIBUYÁN), and (g) Tablas, the largest island (see TABLAS).

(2) An island of the province of Romblón, lying midway between Sibuyán and Tablas, on the route of steamers passing through San Bernardino Strait and Verde Passage, area 50 square miles. A central mountain range traverses the island from north to south, with spurs extending toward east and west. The chief occupation of the people is cattle raising; valuable deposits of quartz, marble, and slate are found and quarried; the marble is exported in large quantities. This island is the seat of government for the province.

(3) Pueblo, capital of the province of Romblón, situated on the northwestern coast of the island of Romblón, the largest town of the province. It has an excellent harbor, one of the best of the Visayan group; and is the commercial centre of the island. It has some old fortifications originally built to defend it from pirates. Pop. 6,764.

**Rome, Ga.**, city and county-seat of Floyd County, picturesquely situated at the junction of

the Oostanaula and Etowah rivers, which at this point form the Coosa River. It is situated 72 miles northwest of Atlanta, 195 miles northeast of Selma, Ala., and 73 miles southwest of Chattanooga. Rome is on the Chattanooga, Rome & Columbus branch of the Central Railroad of Georgia, the Alabama division of the Southern Railway, the Georgia division of the Southern Railway, the Rome & Decatur division of the Southern Railway and the Rome Railroad division of the N. C. & St. L. Railroad. Both the Coosa and Oostanaula rivers are navigable.

**Public Buildings.**—Rome has many modern business blocks, handsome churches, and public buildings. Shorter University for Women is here located. It also has a United States post-office and court-house, besides opera house, fine school buildings, and national and state banks.

**Industries.**—There is a large and increasing trade here in cotton manufacturing and general merchandise. In the city and contiguous thereto are numerous cotton mills, planing mills, furniture factories, iron foundries, plow works, ice mill, cottonseed-oil mill, sash and door factories, and other smaller industries. The assessed property valuation of Rome is over \$6,000,000.

**Government.**—Rome was incorporated as a city in 1847, and is governed by a mayor and city council. It has an electric light plant and waterworks, and 12½ miles of street railway system.

**Population.**—The population in 1870 was 2,748; (1880) 3,877; (1890) 6,957; (1900) 7,291; (1910) 12,099. Including its suburbs, it had in 1910 at least 20,000 population.

**Rome (Ga.), Engagement at, and Capture of.** When Gen. Sherman was closing in on the Confederate army at Resaca he ordered Gen. Garrard to move with his cavalry division from Villanow toward Rome, to cross the Oostanaula and operate on Gen. Johnston's flank. On 16 May 1864, after the fall of Resaca, Gen. J. C. Davis' infantry division was ordered down the west bank of the Oostanaula to support Garrard, and Garrard was further ordered to leave his artillery at Farmer's bridge, eight miles above Rome, in charge of Davis, who was to rejoin his corps at Kingston, while Garrard made a rapid movement on Johnston's flank. Davis made a march of 15 miles on the 16th, and bivouacked a few miles from Farmer's bridge. Meanwhile Garrard had, on the 15th, driven the Confederate cavalry from Farmer's bridge, and pursued to within sight of Rome, but the force developed proving too large to engage, he returned to Farmer's bridge, on his way to Lay's Ferry, where he met Davis on the evening of the 16th. Davis determined to continue on to Rome, which, when he arrived there on the 17th, was held by two Confederate brigades. At 5 p.m. the Confederates advanced and drove in his skirmishers. Davis now brought up his entire division, deployed two brigades and held one in reserve. A severe contest ensued, which continued until dark, when the Confederates withdrew to their works and Davis threw up intrenchments. On the morning of the 18th he ordered an advance, and found the works in his front abandoned. He occupied Rome, capturing ten guns, valuable iron works and machine-shops, and a large amount of public stores.

## ROME

His loss was about 150 killed, wounded, and missing; the Confederate loss, about 100 killed and wounded.

Consult: 'Official Records,' Vol. XXXVIII; Van Horne, 'History of the Army of the Cumberland,' Vol. I. E. A. CARMAN.

Rome, Italy, the capital of the kingdom, as formerly of the Roman republic and empire, the Papal See, and long the religious centre of Western Christendom, is one of the most ancient and interesting cities of the world. It is traversed from north to south by the Tiber. Modern Rome embraces the ground, occupied by ancient Rome, on the left bank, besides an extended portion on the right, added during the rule of the Popes. A large part of the modern city stands on the flat plain known as the Campus Martius. The ancient city was enclosed by a wall, which at first embraced only the Palatine Hill, was built by Romulus, and had three gates. The second wall, attributed to Servius Tullius, enclosed all the hills, which gave to Rome the name of the City of the Seven Hills. This wall was built of huge blocks of stone without mortar. The third wall, the Aurelian (3d century), was built by the emperor whose name it bears, and had a circuit of about 11 miles. It had towers and bastions and 14 gates. It was not until the 17th century that Rome attained its present limits by a wall built under the pontificates of Urban VIII. and Innocent X. The walls are of brick and stone, and about 55 feet high, with 12 gates and several railway passages. The improvements of the modern city are suggestive of the new thought and practical endeavor of the age, yet the charm of beauty and dignity still lingers around the ruins and monuments of the ancient city. Extensive excavations have revealed interesting antiquities; those of the Forum Romanum and the Via Sacra; the remains of the temple of Saturn and of Castor and Pollux, the temples of Vespasian, of Antoninus and Faustina, the temple of Vesta, etc. Numerous villas and palaces and countless works of art have also been discovered. The Roman Forum lies between the Capitoline and Palatine Hills, and extends from the arch of Septimius Severus to the temple of the Dioscuri. It was surrounded by magnificent palaces, temples and basilicas. The Forum was originally a place where markets and courts of justice were held. It was open on one side and on the other was divided into corridors or halls containing the Exchange. This part was subsequently occupied by basilicas and temples. In 472 the Forum began to be the place of assembly of the Comitia Tributa. In the time of the Republic, public banquets and gladiatorial combats were held in the great Forum, which also contained various monuments, chief of which was the Columna Rostrata, erected in memory of the victory over the Carthaginians. The rostra, from which public orations were delivered, formed the boundary between the Forum in its limited sense and the Comitium. The Forum was under the Republic the centre of Roman political life. The Via Sacra was the main central street, skirting the Forum on one side, and passing by the Palatine to the arches of Titus and Constantine on to the Appian Way, the streets of tombs. The principal streets and squares of modern Rome

are the Piazza del Popolo on the north side near the Porto del Popolo, containing a fine Egyptian obelisk, from which diverge three of the great thoroughfares, the Corso, leading directly for one mile to the Piazza di Venezia, near the Capitol; the Via di Ripetta, which winds its course into a maze of ancient streets, and Via del Babuino, leading to the Piazza di Spagna, then further to the Quirinal, and passing through a tunnel, opens on the Esquiline; the aristocratic quarter lies between the Corso (lined with elegant modern palaces) and the Esquiline. Above the Piazza di Spagna, and approached by a noble flight of steps, is the Piazza de Trinità in front of the church of the same name, built by Charles VIII. in 1494. This eminence is the Pincio, the "hill of gardens," one of the historical seven hills, now a favorite promenade and once the site of the celebrated Gardens of Lucullus. The view thence of Rome is fine. The shaded walks are adorned by busts of celebrities. At the foot of the wall lies the Villa Borghese, containing objects of great interest, with its beautiful park, adjoining which is the Villa Medici, whose museum contains some rare antiquities. Other squares are: Piazza Barberini adjacent to the Palace; Piazza Colonna in the centre of the city, with a column of Marcus Aurelius, and nearby the Piazza di Monti Citoria, on which stands the Chamber of Deputies and other government offices; the Piazza San Pietro with its artistic colonnade, in front of Saint Peter's, and the Vatican; Piazza di Navona with a fountain and two churches. From Via Ripetta, two minor streets radiate, one to the Via Nazionale, the great business thoroughfare of the modern city and bordered by imposing and elegant buildings. From the Piazza del Indipendenza the Corso Vittorio Emanuele extends to the Piazza delle Terme and the ruins of Diocletian. All the railway lines converge at the Piazza dei Termini. The Via Cavour runs parallel to the Via Nazionale from the Station to the Capitol. The Piazza del Campidoglio in front of the Capitol contains the perfect equestrian statue of Marcus Aurelius, so celebrated as having Michelangelo's special regard. Other squares are the Piazza di S. Agnes, a martyred saint; Piazza di Navonna, containing the famous statue, a noble Greek work, of Pasquino (hence the term "Pasquinades") where for a long time satires of the day, directed against the Pope or nobility and prevalent follies, were posted; the Piazza di Montanari, where from time immemorial peasants contracted with land-owners for the season's farm-work. The Via Venti Settembre contains the immense palace of the Treasury, the war office, the Scotch church and school, many fine new edifices, and the British embassy, with its grand, old garden, the last remnant of the gardens of Papal Rome. In the new quarter, embracing the Esquiline, Viminale and a portion of the Pincian Hill, besides the Indipendenza, are the Piazzas di Dante, Vittorio Emanuele, Esquilino, Guglielmo Pepe, etc. Of the historical hills, the Capitoline, crowned with historical sites and fragments, claims our first attention. Upon it stands the modern Capitol, over the ancient Tabularium, which contained the tables of the laws, and is believed to have communicated with the Ærarium in the temple of Saturn. "The beautiful Tarpeia," says Nie-

PIAZZA NAVONA, OR CIRCUS AGONALIS, ROME.

## ROME

buhr, "still sits sparkling with gold and jewels, enchanted and motionless, in a cave in the centre of the hill." Thus the ancient Mons Tarpeia remains the treasure of art, the wonder of history. On the Capitoline, Numa founded a temple of Fides Publica and another to the god Terminus. Under Tarquinius Superbus, 535 a.c., was built the Temple of Jupiter Capitolinus, with money taken from the Volscians in war. This sumptuous fane had peculiar claims on the veneration of the Roman citizens—it was citadel and shrine, combined. The Sybilline books were preserved there. There both Titus and Vespasian celebrated their triumph over the fall of Jerusalem. It was later robbed of its treasures during invasions of the Vandals. Near it stood the temple of Fides and the twin temples of Mars and Venus Erycina. The temple of Jupiter Tonans was built by Augustus; the temple of Honor and Virtue by Marius in 103 a.c., with spoils taken in the Cimbric wars. There were still other notable temples, and the Altar of Jupiter Pastor, commemorating the stratagem of the Romans, who threw down leaves into the camp of the besieging Gauls to deceive them as to the state of their supplies. On this hill Petrarch received his laurel crown, and the tribune Rienzi promulgated new laws. Michelangelo designed the present Museum and Palace of the Conservatories, under Pope Paul III. (1544-50); Pius IV., Gregory XIII. and Sixtus V. added the sculptures, etc. At the foot of the Capitol is the ancient church of Ara-Caeli, the building at the back of the piazza is the Palace of the Senator, built by Boniface IX. (1389), but altered by Michelangelo. The ornamental fountain at the foot of the double staircase was erected by Sixtus V. The tower of the Capitol contains the great bell of Viterbo, taken in war; the view from this high point is superb. On the east side of the piazza is the Museo Capitolino, containing one of the finest collections of statuary and painting, and the famous mosaic, Pliny's Doves, found in the ruins of Hadrian's Villa near Tivoli. In "The Reserved Cabinet" stands the exquisite Greek statue Venus of the Capitol, found imbedded in a wall upon the Quirinal. In the Hall of the Emperors is the imposing seated statue of Agrippina (grand-daughter of Augustus); and 83 busts of Roman emperors, empresses and their families, a character study. Many of them are important as works of art. The Hall of Illustrious Men is interesting, as is also the Hall of the Faun, from the Faun found at Hadrian's Villa. The statue of the Faun is highly graceful and artistic. The three gems of the collection are found in the Hall of the Dying Gladiator, the Dying Gladiator, the Antinous of the Capitol, and the Faun of Praxiteles. On the west side of the piazza is the Palace of the Conservatories, which is to receive all the recently discovered antiquities. It contains busts of artists by Canova, the restoration of a column of Michelangelo, many fine frescoes and reliefs by Bernini and other masters; the Apollo Belvedere and the famous Bronze Wolf of the Capitol, of unknown antiquity. Near the wolf is the well-known and beautiful figure of the boy extracting a thorn from his foot. The Picture Gallery of the Capitol contains few good works, a beautiful Saint Sebastian by Guido, and several others by Guercino.

At the head of the Capitol steps, to the right of the terrace, stands the Palazzo Caffarelli, the residence of the German minister; the view commands the Forum and ruins as far as the Colosseum and to the Alban Hills beyond, where every stone has its story, from the Arch of Septimius Severus to the colossal Amphitheatre, embracing the remains of temples, arches, and royal palaces. The eight Ionic columns standing are a part of the temple of Saturn. At the right side of the Forum the remains of the Basilica of Julia, begun by Julius and completed by Augustus Caesar, and just beyond are the three beautiful columns which belonged to a temple of Castor and Pollux, 484 a.c. Here costly sacrifices were offered and Roman knights richly decorated and crowned with olive, passed in military procession. The entablature supported by these columns is very rich and considered one of the finest specimens of Corinthian extant. On the right the Via Fienli branches off, leading to the Circus Maximus, with a capacity for 25,000 people (used for hunting wild beasts). The Palatine Hill, quite near, was the pivot of Rome's history, where the Pelasgic fortress was enclosed by Romulus, and where Augustus was born. This was the site of the Palaces of the Caesars, pompous and magnificent beyond description. The temple of Apollo, of white marble, was the resort of poets. Close under the Palatine is the temple of Vesta, founded by Numa. Near was the Regia, whence Caesar went forth to death. Adjoining the Basilica Julia is the Column of Phocas, sung by Byron. On one side of the Forum stood the Tabernae Argentariae, silversmiths' shops, and in front of Saint Adriano, beyond the Taverna Nuova, Virginia was stabbed by her father. The front of Saint Adriano is a fragment of the Basilica of Æmilius Paulus. This Basilica occupied the site of the famous Curia of Tullus Hostilius. The three gigantic arches still farther are all that remains of the Basilica of Constantine, one of whose classical Corinthian pillars was incorporated by Paul V. in Saint Maria Maggiore. Mediæval remains exist in a group of interesting churches in the vicinity. Little remains of the once superb temple of Venus and Rome, except a cella, countless fragments of columns, and a mass of Corinthian cornice facing the Colosseum. This was the last pagan temple which remained in use in Rome. Near the church of Saint Francesca the Via Sacra passes under the Arch of Titus, the most beautiful monument of its kind remaining in Rome, erected by the senate to commemorate the taking of Jerusalem. The gardens of Adonis, where Sebastian endured martyrdom, border an adjacent lane.

Between the Arch of Titus and the Colosseum the ancient pavement of huge blocks of lava remains. At the foot of the hill is the fountain where the gladiators used to wash. On the right the Via Triumphalis leads to Via Appia, first passing under the Arch of Constantine. This is the most striking of the Roman arches. The Colosseum or Flavian Amphitheatre was begun in 72 a.d. (12,000 captive Jews doing the work), and consists of four stories supported respectively by Doric, Ionic and Corinthian columns. Its circumference is 1,641 feet, length 287, width 182, height 157 feet, and it had the capacity to hold 100,000 persons. Its construction has been ascribed to Gaudentius, a Chris-

## ROME

tian martyr; it was used for gladiatorial combats, and those engaging were slaves or prisoners, or Christians who were compelled to fight wild beasts. Saint Ignatius was the first martyr here, devoured by a lion. Others were shot down by arrows, or exposed to every humiliation and torture. A cross marks the spot in the arena where Christians suffered. The upper arches frame a series of views of the Capitoline, the Caelian, and the Campagna. Other triumphal arches not already mentioned are that of Severus and that of Drusus, 8 a.c. The Column of Trajan, very ornate in spiral bas-reliefs, illustrating the exploits of the emperor, by several thousand carved figures, and 117 feet high, is still standing. The Pantheon, by Agrippa, 27 a.c., a perfect specimen of classical architecture, is a temple to all the gods (now church of Saint Maria Rotonda) and the best preserved of all the ancient temples. It is circular in form and of remarkable construction, as regards its dome, by which it is lighted. The Catacombs are subterranean passages, extending many miles by winding passages underground, used as sepulchres and meeting places by the early Christians; niches in the walls of tufa were used to bury their dead. The passages are narrow, except occasionally when they open into wider spaces used for chapels of worship, and often frescoed. The decoration is characteristic and significant, usually representing Christian hope and doctrine. Pictures are frequently symbolic. A large collection of sarcophagi, pictures and inscriptions from the catacombs, are preserved in the Lateran Museum. The catacombs extend around the city in a wide circle; the most important are the Catacombs of Calixtus on the Via Appia; those of Domitilla or Saints Nereus and Achilleus, Saint Prætextatus, Via Appia; Saint Priscilla, beyond the Porta Salara; Saint Agnese, Via Nomentana; Saint Sebastiano, beneath the church of that name; Saint Alessandro; and the Jewish Catacombs and those of Mithras of the Via Appia.

Rome is par excellence the Mecca of artists, and both museums and Christian temples are the shrines of art. Rome is filled with churches, of which Saint Peter's ranks first. It was founded by Constantine on the site of the Circus of Nero, where Saint Peter suffered martyrdom, and is gorgeously decorated with gold mosaics and marble. Bramante, Raphael, and Michelangelo were the chief architects. Bernini filled it with the sculptures of his contemporaries and many monuments line the pillars and fill niches. The Pietà is one of the notable sculptures of Saint Peter's. The great dome is a marvel of architectural skill. The façade is 357 feet long and 144 feet high, and over the central entrance is the loggia, where the Pope is crowned and whence he gives his Easter benediction. Over the main entrance of the vestibule is the celebrated Mosaic of the Novicella (1298), by Giotto, and Cavallini. The magnificent central door of bronze is a remnant of the old Basilica (1431-9). The enormous size of statues and ornaments in Saint Peter's are deceptive as relates to the vast proportions of its interior, which is only realized by observing the moving, living figures of people. Around the shrine under the dome, 86 gold lamps burn continually. Wonderful mosaic pictures are

among the countless gems which enrich this noble temple. Its interior has the form of a Latin cross with chapels on the sides. Many princes of the church lie buried in the crypt. The Vatican, the present residence of the popes, is a vast collection of palaces, comprising the old and new palaces of the popes, the Sistine Chapel, the Loggia and Stanze, the picture gallery, museums and library. Raphael's wall frescoes rank above all his other work, and in the 'School of Athens' and 'Disputa,' the 'Transfiguration,' 'Driving Heliodorus from the Temple,' and other frescoes of the Stanze and Loggia, he evinces astonishing theological wisdom and philosophical erudition. Each stanza attests to his deep reflection and rich imagination; detail and general effect are equally studied, resulting in a perfect harmonious whole. In the Sistine Chapel, the 'Last Judgment' is Michelangelo's chef d'œuvre.

The Vatican Library contains 220,000 volumes and over 26,000 MSS. San Giovanni in Laterano, on a lonely site near the south wall, was built by Constantine, but has since been rebuilt, altered and extended by Giotto and others under various popes, and the high church councils are held there. Other churches are Santa Maria Maggiore, in whose construction antique bronzes, gold and marble from pagan temples were largely used, also beautiful mosaics of the 6th century. Santa Croce, erected by Saint Helena, the nave of which was borne by eight antique columns; Saint Clemente, the most perfect specimen of old basilica, contains frescoes by Masaccio; Il Gesù, the principal church of the Jesuits, with the façade and cupola by Giacomo della Porta, and whose interior is rich in marbles; Santa Maria degli Angeli, originally a part of Diocletian's Baths, transformed into a church by Michelangelo, an imposing church, contains an altar-piece by Muziano, and a fine fresco by Domenichino, and the tomb of Salvatore Rosa; Santa Maria in Ara Coeli, remarkable for its architecture and very old; Santa Maria in Cosmedin at the north base of the Aventine, remarkable for its Alexandrine pavement and its lofty and beautiful campanile of the 8th century; Santa Maria sopra Minerva, notable as the only Gothic church in Rome; Santa Maria in Dominica or della Navicella on the Caelian, with 18 fine columns of granite and two of porphyry, and whose frieze of the nave was painted in Cambric by Giulio Romano and Perino del Vago; Santa Maria della Pace, interesting for its paintings, particularly the four sybils, considered among the most perfect works of Raphael; Santa Maria del Popolo, notable for its sculptures and paintings ('Jocah' by Raphael, ceiling frescoes by Pinturicchio, and mosaics from Raphael's cartoons by Aloisio della Pace); Santa Maria in Trastevere, an antique church, first mentioned in 449; and San Paolo fuori le Mura (on the spot where Saint Paul suffered martyrdom). In San Pietro in Vincoli is the celebrated 'Moses' of Michelangelo, by some critics regarded his best work of sculpture. The great baths or thermæ were peculiar features of the city and were used not only for bathing purposes, but for games and athletic sports, and contained assembly rooms, libraries, promenades, etc. The thermæ of Caracalla, Titus, and Diocletian were the most magnificent and largest. The great cloacæ (or

1. Facade of St. Peter's.

2. Interior of Basilica of St. Peter's.

## ROME

sewers) belonged to the Severan epoch. The Cloaca Maxima was the principal sewer. The aqueducts, built on rows of arches, thread the campagna for a distance of 60 miles, passing at times through hills and represent marvellous engineering skill. The Aqua Paola, Aqua Trajana and Aqua Marcia still remain, and contribute to the water supply of the city. Among the finest sepulchral monuments, the chief were the Mausoleum of Augustus in Campus Martius; that of Hadrian on the west bank of the Tiber, now the fortress of modern Rome, and known as the Castle of San' Angelo. The city was also rich in private palaces and buildings. The Naumachiae were artificial lakes constructed for fighting naval battles. There are ten bridges across the Tiber, besides the railway bridge. The highest is the Ponte Margherita, opposite the Piazza del Popolo; the Ponte di Ripetta, in the place where the old ferry was, to "the farm of Cincinnatus." (This bridge leads to the new quarter.) The Ponte Umberto, leading to the newly erected Palace of Justice or law-courts on the right bank, the Ponte Sant' Angelo, ancient Pons Aelius, leading to the castle. Below it is a new trestle-bridge; and still below this is the iron suspension bridge; farther, the Ponte Gianicolo, Ponte San Sisto; Ponte Garibaldi; then the two bridges which cross the island in the Tiber. The Villa gardens are fast being replaced by tenement houses and new suburbs are springing up. The University of Rome or Collegio della Sapienza is an ancient institution; canon law and civil law, medicine and philosophy and philology are included in its curriculum. It possesses extensive laboratories, botanical gardens and an astronomical observatory. It is attended by nearly 1,000 students. The Collegio de Propaganda Fide is situated in the Piazza di Spagna; the Collegio Romano, adjacent to Saint Ignazio, is a lyceum, and now contains the Archaeological Museum and the recently established library, Biblioteca Vittorio Emanuele, combining the old Jesuit library with the libraries of suppressed monasteries, amounting to about 500,000 volumes. The Accademia de' San Luca, for the promotion of the fine arts, is composed of painters, sculptors and architects, and was founded in 1595. Connected with it are a picture gallery and schools of fine arts. There are numerous other institutions connected with art, music, science or learning, one of which the Accademia de' Lincci, founded in 1603 by Galileo and his contemporaries, is the earliest scientific society of Italy. Besides the libraries already mentioned, the chief are the Biblioteca Casanatense, the Biblioteca Angelica, and the Biblioteca Barberini. The American College was founded about half a century ago, is a school for priests and is composed of students who desire a post-graduate course in divinity, philosophy, rhetoric, metaphysics, etc. The students enjoy special privileges in the Vatican Library and museums and at all great church functions. There is also an American school of classical studies, under the auspices of the Institute of Archaeology, whose work consists of archaeological research and study, and whose investigations often lead the students as far as Greece or Egypt, accompanied by the faculty. The Irish College is the oldest in Rome, almost hidden by the famous Palazzo Aldobrandini, once the residence of Cardinal Mazarin. Other

famous palaces are the Palazzo Barberini on the Quirinal, built by Urban VIII., almost wholly from materials taken from ancient buildings. In its small but excellent collection is the 'Beatrice Cenci' by Guido Reni—also valuable MSS. and some literary curiosities; the Palazzo Colonna near the centre of the city; the Palazzo Corsini in the Trastevere, once the residence of Queen Christina of Sweden, and containing precious MSS.; the Palazzo Farnese, near the Tiber, was inherited by the kings of Naples, but now belongs to the French government, and is occupied by the ambassador. The Spada Palace is one of the finest examples of the late Renaissance; the Palace Rospigliosi, near the Palace of the Quirinal, contains valuable art treasures. On the ceiling of a casino in its gardens is the beautiful fresco of the 'Aurora' of Guido—this is now the residence of the French ambassador to the Pope; the Palazzo di Venezia is adjacent to the principal Jesuit church. The government buildings occupying former church property are the Post-office in the ancient convent of Saint Silvestro, the Ministry of Public Instruction in the convent of the Minerva. The porticoes or colonnades were public places of recreation or for the transaction of business. Among the basilicas, one of the most beautiful was the Aemilian on the north side of the Forum Romanum, 179 A.C.; the Basilica Julia, recently excavated on the south side of the Forum, begun by Caesar, and the Basilica Porcia, the oldest, built by Cato, the censor. Recent excavations have thrown considerable light on the subterranean galleries, connected with the games held in the time of Caesar in the Forum. It is clear that 12 elevators were used to deposit quickly the various parties of combatants. Equestrian statues were later placed above them. The square basement of Janus Medius, wells containing fragments of pottery, graves containing chalices, have also been discovered. Under the substructure narrow prison cells have come to light. At the foot of the Palatine were revealed the remains of an imperial palace, later transformed into a Christian sepulchre; also some prehistoric tombs. The ancient graffiti—that is the rough sketch or misspelled word scratched upon walls or columns by early Christians and thoughtless idlers, have solved many topographical problems of the ancient monuments of the 'Eternal City.' Among the Columns, the oldest was the Columna Mœnia, in honor of Mœnius who took the town in 338 A.C.; the Columna Rostrata, commemorating the victory over the Carthaginians 260 A.C. The most beautiful was that of Trajan in the Trajan Forum (described elsewhere), and a similar one in the Via del Corso near Palazzo Chigi. The most celebrated theatres are those of Pompey, Cornelius Balbus and Marcellus. The theatre of Pompey was adorned by the most beautiful Greek statues. It held 40,000 persons. The Colosseum as already described was the most magnificent amphitheatre. Hospitals of every description, some of which are richly endowed, are numerous. Church festivals are a special feature of Roman life, but the pomp and show of former times has somewhat diminished. External trade is unimportant. The chief manufactures are woolen and silk goods, artificial flowers, pottery, jewelry, mosaics, casts, and objects of art. Trade is chiefly in these articles,

and in olive oil, pictures, and antiquities. Pop. (1901) 462,781.

**History.**—Legend, accepted as authentic in later Roman times, made Romulus (q.v.) the founder of the city of Rome, and the Palatine, one of the seven hills that rise on the left bank of the Tiber, the site of the first settlement. The entire period from the date of the foundation of the city, 753 a.c., to the establishment of the republic, 509 a.c., is in its detailed history unknown to us, and from the mass of myth and legend it is possible to derive the very broadest conceptions only of the beginnings of the Roman state. This is due to the fact that the authentic records of Rome date only from 390 a.c., the year of the destruction of the city by the Gauls. Tradition, then, speaks of seven kings who, including Romulus, ruled over the city for 243 years and assigns to each definite services rendered to the state. Romulus was the founder and conqueror; his successor Numa Pompilius, was a religious teacher; Servius Tullius, a political reformer and law-giver, etc. The last three kings, Tarquinius Priscus, Servius Tullius and Lucius Tarquinius Superbus, were of Etruscan origin, whereas the earlier rulers had come from Latin stock. With the overthrow of Tarquinius Superbus in 510 the Roman kingship comes to an end. A critical study of this legendary period makes all these names and the events connected with them doubtful, but preserves the general outline of development. Rome, in the modern view, is regarded as having had its origin in the union of three tribes, the so-called Ramnes, Tities and Luceres, of whom the first were of Latin blood, the second of Sabine stock and the third of doubtful affinity. The situation of Rome on the hills near the mouth of the Tiber was favorable for its development, and in the course of time the city extended its authority over the neighboring country until with the destruction of Alba Longa, the ancient religious centre of the Latin peoples, it came to assume a pre-dominant position in Latium. The Etruscan character ascribed to the last three kings points to an Etruscan conquest, and indeed throughout the early period of Rome the influence of the Etruscans to the north is marked, especially in religious customs and in architecture. From the very earliest period the inhabitants of Rome appear to have been divided into two classes, the patricians and the plebeians or *plebs*, with whom probably may be ranked the class of *clientes*. It was the patricians alone that constituted the state; the *plebs* had no political rights whatsoever. In fact early Rome should be regarded as consisting of two isolated communities, one comprising the original settlers or, possibly, the conquerors of the city, the other the conquered population and later immigrants, such as those attracted to Rome by the excellent opportunities for trade it offered. Not only was the political power in the hands of the patricians, but even the early Roman religion was largely in the nature of a narrow national creed to which the *plebs* could not be admitted. Inter-marriage between members of the *populus* and plebeians was forbidden. The patricians alone had the right to bear arms. Within the *populus* or state, the headship was vested in the *rex* or king, who combined in himself the functions of war leader, judge and priest, and was

assisted by a council of elders or senate. The Roman "people" was divided into wards, class or *gens*, and households. When assembled for the exercise of its sovereign powers it was known as the *comitia curiata*. A change in the relations between patricians and *plebs* was effected by a reform which legend ascribes to Servius Tullius. By this innovation the right of bearing arms was conferred on the *plebs*, and the entire free-holding Roman community was divided into five classes, on the basis of wealth. These classes were subdivided into centuries or "hundreds," and the entire military assembly of the inhabitants bore the name of *comitia centuriata*, which, instituted undoubtedly for purposes of national defense, soon came to exercise important political powers.

The expulsion of Tarquin was followed by long wars with the Etruscans and the Latin tribes, in the course of which Rome for a time had to contend for its existence. A great victory over the Latins in 496 led to the formation of a Latin Confederacy under the leadership of Rome. Thus strengthened the Romans fought successfully against the *Æqui*, the *Volsci* and the *Sabines*, and in 396 captured the Etruscan stronghold of Veii, which was followed by the subjugation of southern Etruria.

The place of the kings was taken after 509 by two consuls, elected by the *comitia centuriata* from the ranks of the patricians. The institution of the senate was retained and plebeians were admitted to membership, but all magisterial offices were closed to members of that order. The period that follows, therefore, is marked by a bitter struggle on the part of the plebeians for political and, to a degree, social equality. Wealth, too, became concentrated in the hands of the patricians and the distribution of the public lands was carried on entirely in the interests of the ruling class. Discontent was also fostered by the severity of the laws against debtors. In 494 the plebeian army, just returned from a victorious campaign, seceded to the Sacred Mount, near Rome, and threatened to found a city for themselves unless concessions were made. The patricians yielded and the office of tribune of the *plebs* was created for the defense of the interests of the lower order against the ruling class. These tribunes, originally two in number, later increased to ten, were given the right of veto on the decisions of the consuls and the senate. In the course of the struggle for an equitable division of the public land, Spurius Cassius, a patrician who espoused the cause of the *plebs*, fell a victim to the vengeance of his caste (486 a.c.). The demand for a codification of the laws led to the appointment in 451 of ten Decemvirs who after two years' work brought forth the Twelve Tables in which the entire system of public and private law was embodied. The act of violence attempted by Appius Claudius, head of the Decemvirs, on the plebeian maiden Virginia led to the overthrow of the Decemvirs in 449 a.c. Protected now against the arbitrary misuse of the law on the part of the patricians, the plebeians pursued with renewed strength the struggle for political and social equality. In 445 inter-marriage between patricians and plebeians was made legally valid. The consuls were supplanted by military tribunes with consular power who might be chosen from among the plebeians. After this the plebeian

## ROME.

conquest of offices proceeded steadily. The quaestorship was gained in 421 B.C., the dictatorship in 356 B.C., the censorship in 351, the praetorship in 337. After a ten years' struggle it was provided by the so-called Licinian Rogations (367 B.C.) that no citizen should own more than 500 *jugera* of the public domain and that the remainder should be distributed among the plebs in small allotments. The consulship was also restored and it was made obligatory for one consul to be chosen from the plebs. By the year 300 complete equality between the orders had been established. The termination of the contest between the two orders may be assigned to the year 286 B.C., when the Hortensian Law made any decree of the *Comitia Tributa*, wherein the plebs were predominant, law for the whole people, the so-called *plebiscite*.

The course of political progress during this period was sharply interrupted by the invasion of the Gauls who in 390 overwhelmed a Roman army on the Allia, burned the city and besieged the garrison in the Capitol. Legend ascribes the defeat of the Gauls to Camillus (q.v.), but in reality it was a large ransom in gold which induced the conquerors to retreat. The devoted patriotism of its citizens, however, restored the fortunes of the city; its houses were rebuilt, the attacks of the neighboring peoples, the Volsci, the *Aequi* and part of the Latini were repulsed, and within a short time Rome had more than regained its former power. With the establishment of internal peace, its career of rapid conquest begins. The Samnites, the most formidable rivals of the Romans, were defeated in three great wars (343-341, 326-304, 298-290) in the course of which Rome contended successfully against the united forces of the peoples of central Italy, aided in the last of the wars by the Gauls. A rebellion of the Latins was crushed in 338, the long struggle terminated in the complete subjugation of the allies, and the inhabitants of Samnium, Picenum, Umbria, Apulia, Lucania and Etruria became the allies of Rome. In 280 war broke out with Tarentum, the most powerful of the Greek cities in southern Italy. Tarentum called Pyrrhus (q.v.), king of Epirus, to its aid. Subjected at first to defeat, the Romans ultimately drove Pyrrhus from Italy and took Tarentum (272). Rome was now mistress of central and southern Italy and had fought with success against the Gauls in the north. To make conquest permanent military colonies were planted in the subjugated territories and a great system of public highways was developed to facilitate communications. The incessant wars had made Rome a nation of soldiers, and now that there was no one to resist it in Italy, it turned its arms against a foreign power, and in the struggle with Carthage made the first beginning of its imperial career.

The early relations between Rome and Carthage were friendly and commercial treaties between the two nations had been concluded at various times. The contest between the two broke out in Sicily, of which the Carthaginians were masters in greater part. The first Punic War (264-241 B.C.) began with the invasion of Sicily by a Roman army. The strength of Carthage, however, was on the sea, and to cope with it, the Romans built a fleet with which in 260 they gained a great victory at Mycale. The fortunes of the war wavered for

a long time until a second victory off the *Aegadian Islands* in 241 brought Carthage to terms. Sicily was surrendered to the Romans who erected it into their first province, and Carthage pledged itself not to wage war on the allies of Rome. In 238 the Romans seized Sardinia and in the following year extended their sway over the Illyrian coastlands and upper Italy. Carthage, robbed of its island possessions in the Mediterranean, more than made up its losses in Spain, and in 218 B.C. the celebrated Hannibal (q.v.), son of Hamilcar Barca, the conqueror of the peninsula, renewed the contest with Rome (the second Punic war) by his attack on Saguntum, a city ally of Rome. Hannibal invaded Italy, overthrew the Romans at the Trebbia (218), on Lake Trasimene, in the following year, and in 216 at Cannae, where the rout of the Romans was complete. Rome, however, remained steadfast with Hannibal at its very gates, husbanded its resources and by carrying the war into Africa forced Hannibal to depart from Italy. In 202 the Carthaginian general was defeated by P. Cornelius Scipio at Zama, and Carthage signed peace giving up Spain to the Romans, dismantling its navy and paying an indemnity of 10,000 talents. The hatred of Rome, however, was not appeased, and when Carthage, after 50 years, showed signs of renewed strength, it was attacked and destroyed (146), after a siege of three years (the third Punic war). The Roman arms in the meantime had also conquered the East. Antiochus III. of Syria was defeated in 190 at Sipylus and deprived of his possessions in Asia Minor. Macedonia, after repeated wars, was made a Roman province in 146, and Greece, which had enjoyed the shadow of freedom for 50 years was reduced to the same condition, in the same year, under the name of Achaia, after Corinth, its most prosperous city, had been stormed and robbed of its art treasures. In 133 Rome fell heir to the dominions of Attalus, king of Pergamus, and the province of Asia was formed out of the territories thus acquired. The Roman rule in the Spanish peninsula was firmly established after two formidable insurrections, one led by Viriathus (148-140) and the other known as the Numantine war (143-133), had been suppressed.

Republican Rome was now at the height of its power, but the wars which had been crowned with such success abroad brought on evils within the state which were destined to destroy it. The task of governing a world empire and carrying on the great game of diplomacy by which that empire had in large measure been built up, naturally called for a more centralized and rapid exercise of authority than was possible with the cumbrous methods of the popular *comitia*. The power of the state gradually passed into the hands of the senate. There grew up at the same time a nobility of the robe, consisting of those who had enriched themselves as rulers of the newly conquered provinces which Rome for a long time regarded as subject territories merely and as fruitful sources of revenue. So wealthy had the state become, indeed, that in the second half of the 2d century B.C. the citizens of Rome were freed from all burdens of taxation, a measure which attracted to Rome a large population of idlers, which derived its chief sustenance from the largesses of the nobles who

found it necessary to court the favor of the mob. Throughout Italy the rich Roman office holders established vast landed estates, which were fast coming to be worked by slaves, and the poor farmers, ruined by this formidable competition, came in great numbers to Rome to swell the ranks of the propertyless. Between this great mass of poor proletarians and the small class of officials, senators and landlords, strife was in the nature of things bound to come, and it was this strife between the *Optimates* or the aristocratic party and the *Populares* or proletarians that, skilfully used by ambitious politicians, brought about the fall of the republic. Noblest of the popular champions were the brothers Tiberius and Caius Gracchus (q.v.) who wrested from the senatorial party an agrarian law favorable to the homeless masses and regained some of the ancient powers of the popular assemblies, but fell victims both to the hatred of their enemies (133 and 121). The war against Jugurtha (q.v.), which revealed the shameless corruption to which the ruling party had sunk, brought forth another popular leader in Marius (q.v.), whose reputation was increased by the splendid victories over the Cimbri and the Teutones in the years 102-101. Moderate at first in his views, Marius was driven, by the agitations of demagogues, to violence. In 90 a.c. the Italians rose in insurrection to enforce their demand for the rights of Roman citizenship, and though the allies were defeated it was deemed expedient to grant them their demands. The termination of this struggle, known as the Social war, in 88 a.c., was followed by a conflict between Marius and Sulla (q.v.), an adherent of the senatorial party, for control in the state, in the course of which both factions were guilty of dreadful excesses. In the year 81 the Marian party was finally overthrown, and Sulla, proclaimed dictator, enthroned himself in power by a bloody proscription of his enemies, and proceeded to revolutionize the constitution of the state so as to place the sole power in the hands of the senate and the aristocratic party. But neither senate nor people was thenceforth to govern in Rome. The example of aristocratic rule based on military force had been set by Sulla and the struggle between parties now passed into a struggle between individuals for control. Gnaeus Pompeius (q.v.) by his victories over Sertorius in Spain and the suppression of the servile insurrection under Spartacus attained immense popularity and this was increased by his readiness to make concessions to popular demands. After his triumphant campaigns against the Mediterranean pirates and Mithridates (q.v.) he was for a time master of Rome. The senate, however, stirred to an assertion of its rights by its successful course in the conspiracy of Catiline (q.v.) now set itself to oppose his will and Pompey, desirous of redeeming the promises made his veterans of allotments of land in Italy, joined with Gaius Julius Caesar (q.v.) and Licinius Crassus (q.v.) to form the first Triumvirate which for a time was absolute in Rome (60 a.c.). Caesar was a leader of the popular party and he aimed at becoming the sole power in the state. Crassus died in 53, and in 49 war broke out between Caesar and Pompey. The former had under his command a splendid army trained by years of campaigning in Gaul and

Britain and in the battle of Pharsalia (48) Caesar was victorious. Pompey fled to Egypt and there perished and the remnants of his party were wiped out at Thapsus in 46 and Munda in the following year. Caesar was now undisputed master of the empire, but fell, after a short rule, beneath the daggers of Brutus and his associates, and his death was followed by the renewal of civil war. Gaius Octavius, Caesar's nephew and adopted son, and Marcus Antonius, Caesar's lieutenant, both aspired to be his successor, but joined in 43 with Aurelius Lepidus, in a second Triumvirate to overthrow the party of Brutus and Cassius. This was accomplished at Philippi in 42, and Octavius and Marcus Antonius, setting aside the weak Lepidus, divided between them the Roman world. But while Octavius governed his western realm with energy, Marcus Antonius gave himself up to the pleasures of Cleopatra's court. War broke out between the two and in the naval battle of Actium (31) the forces of Marcus Antonius were utterly routed. Antonius fell by his own hand and Octavius was left without a rival. With Actium begins the Roman empire.

Octavius made no change in the established forms of government. In 27 a.c. the senate conferred on him for life the government of all those provinces whose defense called for the employment of the military forces of the empire, together with the supreme command of the army and the title of Augustus. Successively Augustus united in himself the great offices of the state, the consulate, the tribunate, the headship of the sacred colleges. The senate was left with the splendid shadow of power, in reality the mere instrument of the emperor's will. The empire, and especially the provinces, found peace after a half century of civil strife and acquiesced in the rule of an autocrat whose sway was far more kindly than the selfish rule of an aristocratic oligarchy. Under Augustus the economic development of the empire made rapid progress; its parts were brought more closely together by increased means of communication; with peace came also rapid intellectual growth, and Latin literature had its golden age in the reign of Augustus. The boundaries of the empire were extended to the north by the campaigns of the emperor's stepsons Tiberius and Drusus, who carried their victorious arms to the Danube and beyond the Rhine. The last years of Augustus' reign were darkened by domestic unhappiness and the great disaster of the Teutoburg Forest where Varro's legions were annihilated by the Cheruscan chief Arminius. Augustus was succeeded in the principate by his stepson Tiberius (14-37 a.d.) who ruled ably in the beginning but hardened with time into a gloomy despot whose suspicions fell heavily on all those members of the nobility who might in any way become rivals for power. Living in retirement on the island of Capri he left the government to powerful ministers, of whom Sejanus (q.v.) is the most celebrated. Caius Caligula (37-41) a madman and a tyrant, was murdered by his guards and was followed by Claudius (41-54) a good-natured dotard who was completely under the control of his infamous wives, Messalina and, after her, Agrippina. By the latter he was poisoned and Agrippina's son, Nero (54-68), succeeded to the throne. After giving the fairest promise for some years, the young

emperor, in spite of such advisers as Seneca and Burrus, entered upon a course of infamous excesses and mad escapades which disgusted alike the senate and the army and brought about a revolt before which Nero fled. Unable to escape he killed himself, the last of the Julian house of emperors.

Galba, Otho and Vitellius, military rulers all proclaimed by their respective armies, fell within the space of two years and were succeeded by Flavius Vespasianus (69-79), commander of the legions in the east. Vespasian introduced economy into the government, brought to an end the Jewish war by the storming of Jerusalem (70) and began the conquest of Britain. The brief reign of his son Titus (79-81) was marked by the eruption of Vesuvius which overwhelmed the cities of Herculaneum and Pompeii (24 Aug. 79). The reign of Domitian (81-96), a younger brother of Titus, was a period of oppression and intellectual stagnation. Cruel, despotic, half-mad Domitian resembled the last rulers of the Julian house rather than the great emperors whom he succeeded and by whom he was followed. Nerva (96-98) was succeeded by M. Ulpius Trajanus (98-117), under whom the empire attained its greatest extent. His campaigns north of the Danube resulted in the erection of the province of Dacia; Armenia and Mesopotamia were acquired and the Parthians were driven back from the Euphrates. Hadrian (117-138) had none of the warlike instincts of his predecessor, but he devoted himself to the task of organizing the affairs of the empire, and better to acquaint himself with the condition of the various provinces he made long and repeated journeys embracing every part of the Roman dominions. Hadrian was succeeded by the philosopher-emperors Antoninus Pius (138-161) and Marcus Aurelius Antoninus (161-180), in whom were exhibited the highest and fullest development of the Pagan character, and though the reign of the latter was disturbed by wars against the Parthians and the peoples of the Danube, it was of this age of the Antonines that an eminent historian speaks as the happiest era in the entire course of European history, if the welfare of the great mass of the population be considered.

With the death of Marcus Aurelius the decline of the empire begins. On the north the Germanic peoples were threatening the Roman frontier and on the east the new Persian kingdom arose as a formidable adversary. Commodus (180-192) neglected the affairs of the empire to win the laurels of a gladiator and was murdered by some of his followers. The Praetorian guard now appears as the maker of emperors. It deposed Pertinax who had been chosen by the senate and sold the throne at auction to the Senator Didius Julianus. The armies of the provinces arose and three claimants for the throne appeared. The successful candidate Septimius Severus (193-211), successful by force of arms, ruled well and sought to repress the power of the Praetorians. The reign of his son Caracalla (211-217), one of the most vicious tyrants in Roman imperial history, is noteworthy for the extension of the rights of Roman citizenship to all free inhabitants of the empire. Caracalla was assassinated by the Praetorian prefect Macrinus, who was speedily succeeded by Heliogabulus (218-222), a priest of

the sun at Emesa. Heliogabulus brought with him to Rome the orgiastic rites of the Orient and became the object of national hatred and contempt. He fell at the hands of the Praetorians, who chose as his successor Alexander Severus (222-235) who ruled with fair ability but perished in a rout of the German legions. There followed a period of confusion in which the decline of the empire was rapidly accelerated. Maximinus (235-238), a Thracian by birth and a soldier of fortune, crushed his rivals, the two Gordians, but fell in battle against the forces of the senate. Balbinus and Maximus, chosen by the senate, were slain by the Praetorians, and Gordianus III. ruled from 238 to 244. He was followed by Philip the Arab (244-249), Decius (249-251), Gallus (251-254), Valerianus (254-260) and his colleague Gallienus (254-268). Valerian was defeated by the Persians and taken prisoner and on the ensuing anarchy usurpers arose in every province, known collectively as the Thirty Tyrants. The border lands of the empire suffered from the invasions of the Germanic peoples and the Persians, and a pestilence which raged for 15 years (251-265) carried off one half of the inhabitants of the empire. The fortunes of Rome rose somewhat under the following emperors, Claudius (268-270), Aurelian (270-275) who drove the Goths beyond the Danube and overthrew the Palmyran kingdom of Zenobia, Tacitus (275-276), and Probus (276-282) who held the Rhine against the Germanic tribes. Carus (282-283) perished in a campaign against the Persians and was succeeded by Numerianus (283-284) who died in the following year. The army thereupon proclaimed as emperor Valerius Diocletianus, who after the death of Carinus (283-285) became sole master of the empire.

Diocletian abandoned the ancient forms of government and transformed the empire into an absolute monarchy. He separated the civil and military administrations, created a new order of officials and brought the finances into order. The supreme power he vested in the hands of two Augusti assisted by two Caesars who in turn were to succeed to the office of Augustus. Thus a more efficient administration would be ensured by the practical division of the empire into four parts. Diocletian, however, did not count on personal ambitions which were destined to wreck his plan. In 305 Diocletian resigned his office and compelled his fellow Augustus, Maximianus, to do likewise. They were succeeded by the Caesars, Constantius Chlorus and Galerius, while new Caesars were created. Confusion and civil war followed and at one time there were six Augusti in the field. The struggle finally narrowed down to a contest between Licinius and Constantine, a son of Constantius, and after two wars Licinius was overthrown and Constantine became sole ruler of the empire. Constantine the Great (324-337) continued the administrative policy of Diocletian. He built Constantinople as a new capital for the empire and made Christianity the state religion. Of his three sons to whom he left power, Constantinus, Constantius and Constans, the first died in 340 and the last in 350. Constantius ruled with undisputed power from 353 to his death in 361. He was followed by Julian, known as the Apostate, (361-363), who fell against the Persians, and Jovian (363-364). Valentinian I. ruled from

364 to 375. He left the government of the east to his brother Valens and made his son Gratian co-emperor. Gratian ruled till 383 with Valentinian II. as co-emperor. The Goths had now broken into the empire and in 378 they inflicted a terrible defeat upon Valens at Adrianople. In this extreme Gratian conferred the government of the east upon Theodosius (379-395), who by war and diplomacy effected a settlement with the Goths. In 392 Valentinian II. died and Theodosius became sole ruler of the empire. His own death followed in 395, after he had divided the empire between his sons, Honorius, to whom was assigned the West under the guardianship of Stilicho, and Arcadius, who became emperor of the East with Rufinus as his adviser. The influx of Germanic tribes into Italy increased in volume. The tide of invasion was checked for a moment by the generalship of Stilicho (q.v.), but in 410 Rome was sacked by the Goths under Alaric, who, passing into southern Gaul established a kingdom there. Other Germanic hordes wrested Spain from the Roman arms. Honorius died in 423 and was succeeded after a brief interval by Valentinian III. who ruled till 455. The defeat of the Huns under Attila on the Catalaunian Fields in Gaul (451) by Aetius was the last effective assertion of the Roman power. Valentinian III. was murdered in 455 and in the strife for the throne that followed, Valentinian's widow summoned to her aid the Vandals from Africa, who plundered the city of its treasures. For 20 years there came a succession of shadow kings, made and unmade by the all powerful commanders of the German mercenaries, Ricimer, and after him Orestes, who in 475 placed his young son Romulus on the throne. The troops under Odoacer (q.v.) revolted, Orestes was overthrown, the child emperor was retired to private life and in 476 Odoacer assumed for himself the title of king of Italy, thus marking the end of the Roman empire in the West. For the history of the East Roman empire see **BYZANTINE EMPIRE**.

*History of the City of Rome subsequent to 476 A.D.*—After the overthrow of the Western Empire and the defeat of Odoacer (see **ITALY, History**) Rome came under the rule of the Ostrogoths. The city suffered severely in the wars between the Goths and Byzantines, in the course of which the city was taken six times. The depredations of the Byzantine emperors as well as of the Christian authorities, who made use of the materials and ornaments of the ancient edifices in the erection of their churches, were the cause of the destruction of many ornaments of the imperial city; but more destructive still were the feuds that afterward (especially in the 10th century and later) raged in Rome between the leading families. In 1084 a part of the Campus Martius, and most of the city in the south, were devastated by the army of Normans, Greeks, and Saracens which Robert Guiscard led to the relief of Gregory VII., then besieged by Henry IV. of Germany in the Castle of Sant' Angelo. In the 14th century the work of destruction and depopulation was hastened by the struggles which resulted from the attempt of Rienzi (q.v.) to found a republic, and was continued during the period of confusion that ensued after the commencement of the great schism in 1378. A terrible pestilence which raged in the city in 1348, is said to have reduced

the number of inhabitants to less than 20,000. A temporary check was given to the confusion that prevailed in Rome toward the end of the 14th century by Boniface IX., but order was not permanently re-established till Martin V. took up his residence in the city after the schism had been virtually terminated by the Council of Constance. Martin's successor, Eugenius IV. (1431-47), is usually named as the pope under whom the work of restoration in Rome began. In this he was followed by Nicholas V. (1447-55), who began the building of the Vatican, Pius II. (Æneas Sylvius, 1458-64), Paul II. (1464-71), who, however, quarried in the Colosseum for the erection of the Palazzo di Venezia, as did also Paul III. (1534-50), when building the Palazzo Farnese. But the most important period in the architectural history of modern Rome was the end of the 15th and beginning of the 16th centuries, when the labors of Bramante, the two Sangalli, Peruzzi, and Michelangelo were pursued under the patronage of Sixtus IV., Alexander VI., Julius II., and Leo X., and when the works of the great architects were adorned in the interior by artists as great or greater, such as Raphael and Michelangelo himself. In 1527 the city was sacked by an imperial army under the Constable of Bourbon. From this date onward the city began to extend more and more over all parts of the Campus Martius. Much was done in the 16th century, especially by Paul III., Pius IV., Gregory XIII., and Sixtus V., for the embellishment and enlargement of the town, the improvement of the streets, and the restoration of the fortifications. Many remains of antiquity were then rescued from destruction, although many more were sacrificed, particularly under Sixtus, for the sake of modern structures. In the 18th century Benedict XIV., Clement XIV. (founder of the Museo Pro-Clementino), and Pius VI. deserve special mention for their efforts to preserve and beautify Rome. In 1798 Rome was occupied by the French, and deprived of many of its art treasures. At the same time a republic was erected in Rome, but this only lasted for a short time, and after a series of disturbances and changes the pope was again reinstated in his dominions in 1799. (See **ITALY**.) From 1809 to 1814 Rome was once more under French rule, the States of the Church having in the former year been annexed to the Napoleonic empire. The short-lived Roman Republic of 1848-9 was followed by the restoration of the papal rule in 1850. On 20 Sept. 1870, the Italian troops, after effecting a breach in the Porta Pia, in the northeast of the city, marched in along the Via di Porta Pia (henceforth called Via Venti Settembre). Since then Rome has been in the possession of Italy, and since the 1st of July of the following year, the capital of the kingdom.

Rome, N. Y., city in Oneida County; on the Mohawk River, the Erie and the Black River canals, and on the New York C. & H. R., the New York, O. & W., and the Rome, W. & O. R.R.'s. The last mentioned now (1904) belongs to the N. Y. C. & H. R. railroad. The city is about 110 miles west by north of Albany and 16 miles northwest of Utica. It is at the head of the Mohawk Valley, on a plateau about 450 feet above Sea-level. The first settlement was made in 1760 by John Roof. The central part of the city is the site of Fort Stanwix (q.v.), erected here in 1758 at a cost of over \$200,000. It was then a place of great importance as it was the defensive point in the "carrying place," or portage, that part of the route between the Atlantic and the Great Lakes, where the journey had to be made by land. Fort Stanwix was a storm centre in the French war and also in the Revolutionary War. Here in July and August, in 1777, there were many sharp engagements, and finally the Tryon County militia under Herkimer defeated the British under St. Leger in the battle at Oriskany. A government arsenal was established here in 1814, but in 1873 was sold for a factory. In 1819 Rome became a village and in 1870 was chartered as a city.

The greater part of the water supply is taken from the Mohawk River, two miles above Rome, at a place called Ridge Mills. The surrounding country is devoted to farming and dairying; but Rome is a manufacturing city. The chief industrial establishments are brass and copper mills, locomotive works, knitting mills, brick works, canneries, breweries, metal bedstead factories, and creameries. The facilities for transportation give Rome considerable commercial advantages. The prominent public buildings are the Rome State Custodial Asylum for Incurable Insane, the Oneida County Home, the municipal buildings, and some of the business blocks. There are 17 churches and two missions. The educational institutions are the Central New York Institution for Deaf Mutes, Saint Peter's Academy (R. C.), opened in 1865, 10 graded public and parish schools, five public kindergartens, four private schools, and three libraries. The libraries are the high school, the Jervis City Library, and the Y. M. C. A. Library. There are two national banks with a combined capital of \$200,000, and two savings banks. In January 1900, the city debt was \$427,564, largely due to the amounts paid for the city sewerage and for the waterworks. This amount has been considerably lessened. The assessed valuation is about \$10,000,000 yearly. The government is vested in a mayor and a council of 15 members, who hold office three years. Pop. (1900) 15,343; (1910) 20,497.

A. H. WRIGHT,  
'Rome Sentinel.'

Rome, Œcumenical Councils of, are six in number, namely, five Lateran Councils, so called as having been held in the Lateran palace; and the Vatican Council, held in the palace of the Vatican. 1. The ninth General Council of the Church, the first Lateran Council, was held in

the reign of Calixtus II. in 1123; it confirmed the concordat of Worms regarding Investiture (q.v.). 2. The second Lateran (10th general) Council, held in 1139 under Innocent II., condemned the Manichean errors of Arnold of Brescia (q.v.). 3. The third Lateran (11th general) Council, under Alexander III. in 1179, condemned the heresies and impieties of the Waldenses and Albigenses. 4. The 12th general Council (4th Lateran) held in 1215 in the pontificate of Innocent III., confirmed the doctrine of transubstantiation and promulgated decrees for the reformation of abuses in the Church and the extirpation of heresies. 5. The 19th General Council (5th Lateran) under Julius II., assembled in 1511, was in session till 1517 when Leo X. was pope; it enacted some laws for the reformation of clerical discipline, and procured from the king of France, Francis I., the revocation of the Pragmatic Sanction (q.v.) which the French clergy had ever regarded as the bulwark of the Gallican Liberties. 6. The Council of the Vatican (20th Œcumenical council), which was opened 8 Dec. 1869 and closed 20 Oct. 1870, under Pius IX., affirmed as the teaching of the Catholic Church the doctrine that the Pope when teaching *ex cathedra* and defining matters of faith or morals is always divinely aided and is infallible.

Rome State Custodial Asylum, an institution for the custody, maintenance and treatment of the custodial class of feeble-minded, located at Rome, N. Y. It was formerly the Oneida County Insane Asylum and Almshouse, but by the acts of the Legislature in 1893 and 1894, the building and grounds were purchased by the state. Among other things, calisthenics, dancing, drilling, kindergarten, sloyd and articulation are taught. Agricultural colonies for the brighter male inmates have also been established.

Feeble-minded are committed to this asylum from all counties in the State, according to the quota assigned each county, which is based on the population of the respective counties, as compared with the capacity of the institution. For their care there are 21 large buildings, beside several small sheds, etc. The average number of inmates is about 700.

Romeo and Juliet, a tragedy by Shakespeare, first published (unauthorized) in 1597. A corrected edition appeared in 1599. The play was written somewhere between 1591 and 1596, and the legend upon which it is founded first appears in a tale printed at Naples in 1476 among the 'Novelle' of Masuccio di Salerno. Luigi da Porta reproduces it in 'La Giulietta' in 1435, and Bandello includes it in his 'Novelle' in 1554. In 1559 a French version of Bandello's 'Novelle' was printed among Pierre Boiastuau's 'Histoires Tragiques'. In 1562 Arthur Brooke printed his English poem 'The Tragical History of Romeus and Juliet,' on which Shakespeare based his drama. In 1562 Boiastuau's French rendering of the tale was translated into English prose by William Painter in his 'Palace of Pleasure,' which Shakespeare consulted likewise. The theme has often been chosen for operatic purposes. Zingarelli's opera, 'Giulietta e Romeo' appearing in 1796; Bellini's 'I Capuletti ed i Montecchi' in 1830; and Gounod's (Roméo et Juliette) in 1867. A

dramatic symphony by Berlioz, 'Roméo et Juliette' was composed in 1839.

**Römer, ré'mër, or Roemer, Ole,** Danish astronomer: b. Aarhuus 25 Sept. 1644; d. Copenhagen 19 Sept. 1710. After study at the University of Copenhagen he was in 1671-81 at Paris, where he made observations in the royal observatory and was elected to the Academy. In 1681 he was made professor of mathematics and director of the observatory at Copenhagen, and subsequently became a councillor of state. He is known chiefly as the discoverer of the finite velocity of light, which he determined by observation of the eclipses of the satellites of Jupiter. He found that when Jupiter and the earth were on opposite sides of the sun, the eclipses seemed to occur too late; when on the same side, too early. The extreme deviation from mean time he computed at 11 minutes; it is now known to be approximately 8 minutes 20 seconds, that is, light crosses the space between the earth and the sun (a little less than 93,000,000 miles) in about 8 minutes. (See LIGHT.) Römer invented the transit instrument (1689) and meridian circle (transit and vertical circle combined; 1690). Consult Grant, 'History of Physical Astronomy' (1852).

**Romero, rô-má'rô, Don Matías,** Mexican diplomat: b. Oaxaca, Mexico, 24 Feb. 1837; d. Washington, D. C., 30 Feb. 1898. He was graduated from the Academy of Theoretical and Practical Law, Mexico City, in 1855, and admitted to the bar in 1857. In the revolution of that year he supported the government and served as secretary to Melchor Ocampo. In 1859 he was appointed secretary to the Mexican legation at Washington and in 1860-3 was *chargé d'affaires*. He then returned to Mexico where he was commissioned colonel in the army, became chief of staff to General Díaz, and later in the same year resumed his diplomatic career as minister to the United States. He held the portfolio of the treasurer in Juárez's cabinet in 1868-73, was a member of the senate in 1876 and on the election of Díaz to the presidency he resumed his position in the treasury. He was postmaster-general in 1879-80, and in 1882 he was again sent as minister to the United States, where he arranged the boundary question and concluded a reciprocity treaty. He was reappointed in 1884 and continued in the position until his death. He published more than 50 volumes, chiefly of technical reports, among which are: 'Coffee-culture on the Southern Coast of Chiapas' (1875); 'Correspondence of the Mexican Legation at Washington during the French Intervention' (1870-85); 'The State of Oaxaca'; 'Mexico and the United States.'

**Romeyn, rô'mîn, John Brodhead,** American Presbyterian clergyman: b. Marbletown, N. Y., 8 Nov. 1777; d. New York 22 Feb. 1825. He was graduated from Columbia in 1795 and was licensed to preach in 1798. He held charges at Rhinebeck, Schenectady, Albany, and New York successively, attained a high reputation as a theologian and was popular as a preacher. He was one of the founders of Princeton Theological Seminary, president of Transylvania University, a trustee of Princeton College and a moderator in the Presbyterian General Assembly. His sermons were collected and published in 1816.

**Romilly, rô'm'î-lî, Sir Samuel,** English statesman and jurist: b. 1 March 1757; d. London 2 Nov. 1818. He entered Gray's Inn to study for the bar, to which he was called in 1783, and gradually rose to distinction in the court of chancery, in which he ultimately took the lead. During the short administration of Fox and Lord Grenville (1806) he was appointed solicitor-general (being member for Queensborough), and knighted. When the Whigs went out of office he remained in Parliament, where he pleaded the necessity of a revision of the criminal code, with a view to the limitation of capital punishment, and a more appropriate regulation of the scale of penalties. To his exertions may be traced the final determination of the executive to the reform and condensation of the various acts in regard to crime, effected under the superintendence of Sir Robert Peel. Consult: 'Memoirs,' written by himself (1840); also 'The Crevy Papers' (1904).

**Romney, rô'm'ni, George,** English painter: b. Beckside, near Dalton-in-Furness, Lancashire, 15 Dec. 1734; d. Kendal 15 Nov. 1802. His father was a cabinet-maker, and the boy learned this trade, but he also taught himself drawing and carved wood, and at 19 was apprenticed to a portrait-painter at Kendal named Steele. In 1757 he entered on his own career as portrait-painter, and after a certain amount of local success went up to London (1762), leaving his wife (whom he married in 1756) and his two children in Kendal. The following year he won a prize offered by the Society of Art for a historical painting, by his 'Death of General Wolf,' and rose steadily in popularity until he held a position beside Reynolds and Gainsborough as a portrait-painter. He visited France twice; once in 1764 and again in 1790, and resided in Italy during the years 1773-5. While in Italy he gave much attention to the works of Correggio, and this, along with his study of the nude, greatly influenced his after-work. In 1783 Romney made the acquaintance of Emma Hart, who afterward married Sir William Hamilton, and she became the model from which he painted such well known pictures as 'St Cecilia,' 'Joan of Arc,' 'A Magdalene,' 'A Bacchante,' and 'Sensibility.' His 'Lady Hamilton as Circe' sold in 1800 for \$30,210, his 'Lady Hamilton as Sensibility' in the same year for \$15,025. Gradually he began to withdraw from portrait-painting, and give more time to historical and imaginative work. In 1786 Alderman Boydell founded his famous Shakespeare gallery, to which Romney contributed a scene from the 'Tempest' and the 'Infant Shakespeare attended by the Passions'; while about this time he painted 'Milton and his Daughters,' and 'Newton making Experiments with the Prism.' In order to find room for these great imaginative pictures he erected a large studio at Hampstead, which he occupied in 1797. But his health at this time began to fail, and in the summer of 1799 he returned to Kendal utterly weakened in body and mind. He had only seen his wife twice since he left her 33 years before, yet she received and nursed him faithfully through his premature senility and dotage until his death.

The art of Romney displays a certain fitfulness of achievement due partly to the instability of his character, and partly to his defective early training. His defects of technique are most

## ROMNEY—ROMULUS

apparent in his historical and imaginative subjects; it is only when we examine his portraits, and especially his female portraits, that we find that beauty of form and subtle charm of color which place him among the greatest portrait-painters of the 18th century.

Consult: Hagley, 'Life of George Romney' (1809); Gamlin, 'George Romney and His Art'; Gower, 'Romney and Sir Thomas Laurence'; J. Romney, 'Memoirs of the Life and Writings of George Romney' (1830).

**Romney (W. Va.), Engagements at.** This place was important as an outpost of the Union troops guarding the Baltimore & Ohio Railroad, and also as a base for operations up the valley of the south branch of the Potomac. It was held early in June 1861 by Col. Angus McDonald, with about 500 Virginia troops and two guns. On the night of 12 June Col. Lew Wallace, with 800 men of the 11th Indiana regiment, went by rail from Cumberland to New Creek Station, and marching across the mountains attacked and routed McDonald on the 13th, and on the same day started on his return by the route he had come. Information of Wallace's movement reached Gen. J. E. Johnston, commanding the Confederate forces at Harper's Ferry, on the morning of the 14th, and supposing it to be the advance of Gen. McClellan's column from West Virginia to co-operate with Gen. Patterson, who was threatening to cross the Potomac at Williamsport, Johnston ordered Col. A. P. Hill, with three regiments, to march on Romney and check the movement (see **NEW CREEK**), burned all the bridges on the Potomac from Harper's Ferry to Williamsport, abandoned Harper's Ferry, and fell back to Winchester. On 23 September Lieut.-Col. Cantwell, with detachments of the 4th and 8th Ohio, a company of cavalry, and one gun, marched from New Creek, drove McDonald's forces from Romney on the 24th, and with a loss of three killed and 30 wounded, returned to New Creek, closely followed by McDonald's cavalry. On 25 October Gen. B. F. Kelley, with detachments of Ohio and West Virginia troops and two companies of cavalry, in all about 2,500 men and two guns, started from New Creek for the permanent occupation of Romney. He captured it on the 26th, after a sharp engagement with McDonald's forces, driving them beyond the town on the Winchester road, and capturing all their trains, two guns, 300 stands of arms, and much camp equipage. A supporting column of the 2d Maryland, Col. Johns, marching from the mouth of Patterson's Creek, through Frankfort and Springfield, was met by the 114th Virginia Militia, under Col. A. Monroe, at the bridge over the South Branch, seven miles from Romney, checked, and fell back to Patterson's Creek, with a loss of six or eight in killed and wounded. On 28 October Gen. "Stonewall" Jackson was assigned to the command of the Valley District, with headquarters at Winchester, and immediately prepared to clear the valley of Union troops. He called out the militia, and being reinforced by Gen. Loring's division from West Virginia, set out late in December to destroy the Chesapeake and Ohio canal, and the Baltimore & Ohio Railroad, and to recover Romney. To withdraw his attention from the railroad, Col. Dunning, in command at Romney, made a demonstration toward Winchester with 2,000

infantry and cavalry and six guns. He marched on the night of 6 Jan. 1862, and next morning at Blue's Gap, 16 miles from Romney, fell upon 700 Virginia militia, under Col. Monroe, scattered them and captured two guns, several prisoners, and some baggage, without the loss of a man, and returned to Romney. On the same day Jackson left the vicinity of Hancock and marched for Romney. Hearing of his approach, the Union troops retreated from Romney on the 10th toward New Creek. Jackson occupied the town on the 14th, and placed Loring's division there in winter quarters. Loring and his officers complained to the Richmond authorities, and the Confederate secretary of war ordered Jackson to move the division back to Winchester, which was done 31 January, and on 7 February the town was again occupied by Union troops, under Gen. F. W. Lander. Between this time and the close of the war the town changed hands several times, but for the greater part of the time was in Union possession. Consult 'Official Records,' Vols. II. and V.

E. A. CARMAN.

**Romola**, röm'ô-lă, a novel by George Eliot, first published serially in 'The Cornhill Magazine' from July 1862 to July 1863, and issued in book form in 1864. The scene is laid in Florence at the end of the 15th century, and its great figure is Savonarola. The civic struggle between the Medici and the French domination and the religious struggle between Renaissance paganism and ascetic Christianity form the background of the tale. The story proper follows the fortunes of Tito Melema, a Greek, charming, brilliant, false,—his marriage with Romola of the Florentine house of Bardi, his moral degradation and death. The incidents are many, the local color is rich, but the emphasis of the book is laid on the character of Tito.

**Romulus**, röm'ô-lûs, mythical founder and first king of Rome. He is said to have been the son of Sylvia, generally, but incorrectly, called Rhea Silvia, daughter of Numitor, king of Alba, and one of the priestesses of Vesta. By the god Mars she became the mother of male twins, whom Amulius, who had usurped the throne of Numitor, ordered to be thrown into the Anio, but the basket containing the two boys, Romulus and Remus, was stranded at the foot of the Palatine Hill. Here a she-wolf, going down to the river to drink, was attracted by their cries, carried them to her cave, and suckled them. Some time afterward chance brought thither Faustulus, the king's herdsman, who took them home and educated them. With him Romulus and Remus spent their youth. When they had grown up Amulius was deprived of his usurped throne by Romulus who reinstated his grandfather Numitor in his dominions. After this the brothers resolved to build a city. Romulus wished to place it on the Palatine, Remus on the Aventine, or on another hill three or four miles down the Tiber. Determining to reach a decision by consulting the augurs, each took his station on his favorite hill; the night passed away, and at the first streak of dawn Remus saw six vultures; but at sunrise, when this news was brought to Romulus, 12 vultures flew by him. Each claimed the augury in his favor; but as their companions decided for Romulus his brother was forced to yield. Romulus,

to outline the boundary of the city, yoked a bullock and a heifer to a plow, marked a deep furrow round the base of the Palatine, and guided by this line began to raise the wall. Remus leaped over the rude rampart in scorn, whereupon the enraged Romulus slew him. According to another tradition Remus fled from the anger of his brother beyond the Alps, and founded Rheims. Romulus was immediately struck with remorse, and could obtain no rest till he appeased his brother's shade by instituting the festival of the Lemuria for the souls of the departed. Thus is Rome said to have been founded in the year 753 (or according to others 752 or 751) B.C. The small number of friends who had followed Romulus were insufficient to people his city. Men enough were gained by making the city a refuge for exiles; but the Roman citizens soon wanted women. Romulus thereupon instituted a religious festival, to which he invited the Sabines with their wives and daughters. In the midst of the festival the unarmed strangers were suddenly attacked, and the Sabine women borne away as captives. The two states thus became engaged in war; but the entreaties of the ravished females, who threw themselves between the contending parties, at length effected a peace, and Rome gained by her union with the Sabines an important addition. According to tradition Romulus ascended to heaven into the company of the gods, after he had completed the work of founding the eternal city; and, until the introduction of Christianity, Rome worshipped its founder in temples expressly dedicated to him.

**Ronaldshay**, rân'ald-shâ, North and South, two of the Orkney Islands (q.v.), Scotland.

**Ronayne**, rô-nân', Maurice, American Roman Catholic clergyman and author: b. Castlemartyr, Ireland, 2 April 1828; d. Fordham, N. Y., 3 March 1903. He received his education for the priesthood in Ireland and France, and entered the Jesuit Order in 1853. He came to the United States in 1855, was ordained to the priesthood in 1856, taught in St. John's College, Fordham, N. Y., and was for many years professor of history in the college of St. Francis Xavier, New York. In 1898 he returned to the college at Fordham, where he spent the remaining years of his life as spiritual director. His writings upon the labor question may be found in various Roman Catholic periodicals. His most important books are: 'Religion and Science' (1879) and 'God Knowable and Known.'

**Ron'cador**, one of several Californian drum-fishes of the family *Sciaenidae*, especially the red *Sciaenidae* *saturnus*, and *Roncador stearnsi*, both food-fishes of some importance.

**Roncesvalles**, rôn-thês-vâl'yês (French, RONCEVAUX, rôns-vô), Spain, a valley in Navarre, between Pampeluna and St. Jean de Port, where, according to tradition, the rear of Charlemagne's army was defeated by the Arabs in 778, and the brave Roland killed. The battle forms an essential part in the fabulous cyclas of Charles the Great or Charlemagne (See **ROLAND** and **ROMANCE**.) Roncesvalles, the chief place of the valley, 22 miles northeast of Pampeluna, is traversed by the so-called Gates of Roland, leading over the Pyrenees to France; in the church fabulous antiquities bearing the name of Roland

are shown. The French under Moncey defeated the Spaniards here in 1794, and here Soult took up a strong position in 1813, from which he was dislodged by Wellington.

**Ron'co**, a West Indian name for various drumfish of the genus *Hamulon*, popular among fishermen and in the market, especially *H. bonariensis* (ronco prieto) and *H. parra* (ronco blanco) or sailor's choice.

**Rondeau**, rôn'dô, or **Rondo**, originally a short lyric of 13 lines divided into three unequal strophes; the two or three first words form the burden, and are repeated after the 8th and 13th line. The term is now chiefly applied to a musical composition, vocal or instrumental, generally consisting of three strains, the first of which closes in the original key, while each of the others is so constructed in point of modulation as to reconduct the ear in an easy and natural manner to the first strain. The rondeau takes its name from the circumstance of the melody going round after both the second and third strain to the first strain, with which it is finally closed. While it frequently forms the last movement of a sonata or a symphony, it is quite as common as a separate composition.

**Ronge**, Johannes, yô-hân'nês rông'ê, German Anti-Catholic religious leader: b. Bischofswalde, Silesia, 16 Oct. 1813; d. Vienna 26 Oct. 1887. He studied theology at the University of Breslau 1837-9, was ordained to the priesthood in 1840, and in 1841 became chaplain at Grottkau. Having manifested an opposition to the discipline of the church, he was suspended in 1843. On 1 Oct. 1844, he published a letter against the exhibition of the 'holy coat' at Treves, which was soon followed by the organization of the so-called German Catholic congregations. (See **GERMAN CATHOLICS**.) He published in succession a number of pamphlets, in which he called on the Roman Catholic laity and the lower clergy to leave the communion of that church. These were generally understood to be written from the standpoint of deism; and in subsequent years Ronge pronounced himself more and more unreservedly in favor of deistic doctrines. He took part with the radicals in 1848, and was obliged to flee to London, where he signed in 1851, with Ruge, Struve, Kinkel, and others, a democratic manifesto to the German people, and where he became the leader of a free congregation. In consequence of the amnesty granted by the Prussian government, he in 1861 again made his appearance in Breslau. He founded a reform association at Frankfort-on-the-Main in 1863, and from 1873 resided at Darmstadt. Consult the article 'Deutschkatholiken' in Wetzer und Welte's 'Kirchenlexikon.'

**Ronsard**, Pierre de, pê-êr dê rôn-sâr, French poet: b. Chateau de la Poissonnière, Vendômois, 11 Sept. 1524; d. St. Cosme near Tours, 27 Dec. 1585. He entered as page the service of the dauphin, and then of the Duc d'Orléans, 2d son of the king. In 1538 he accompanied James V of Scotland and his bride Marie de Lorraine back to their kingdom, and remained at the Scottish court three years. He also spent six months at the English court, and was then employed in a diplomatic capacity in Germany, Piedmont, Flanders, and Scotland.

## ROOD—ROOF

On his return to France he devoted himself with great eagerness to the study of literature. With a group of followers, self-styled the "Pleiade," he cast away the literary traditions and ideals of mediæval France, and sought inspiration from the Latin and Greek classics. The result was transformatory, and Ronsard's influence on the progress of French letters was thus very great. In the Floral Games at Toulouse he triumphed over his competitors, and received a silver statue of Minerva, which he presented to Henry II. He was greatly esteemed by that prince, and by his successors, Francis II. and Charles IX.; obtained the abbey of Bellocane, and was also prior of St. Cosme. His writings, consisting of sonnets, madrigals, eclogues, lyric pieces, elegies, and satires, and a fragment of an epic poem, 'La Franciade,' were read with almost incredible admiration by his contemporaries, and brought him valuable presents from Queen Elizabeth of England and the imprisoned Queen of Scots. Many of his sonnets and odes possess considerable merit, but his style is marred by affectation, and his pages are filled with freshly imported words from the classic languages. There are editions by Blanchemain (1856-67) and Marty-Laveaux (1887 et seq.).

**Rood.** Ogden Nicholas, American physicist: b. Danbury, Conn., 3 Feb. 1831; d. New York 12 Nov. 1902. He was graduated from Princeton in 1852 and afterward studied at Yale and at the universities of Munich and Berlin. He was appointed to the chair of physics and chemistry at the University of Troy in 1858, and in 1863 accepted the chair of physics at Columbia where he remained until his death. In his researches and experimental work he showed great originality and skill, his specialties being in the fields of mechanics, optics, acoustics, and electricity. His original experiments included the application of stereoscopic photography to the microscope, the quantitative analysis in color contrast, the measurement of the duration of flashes of lightning, and he was the first to describe a photometric method that is independent of color. He was a leading member of the prominent scientific societies, author of nearly 100 monographs and also wrote: 'Modern Chromatics' (1881); 'The Voice and the Ear'; etc.

**Rood, a cross.** The term is more particularly applied to the large cross erected in Roman Catholic churches over the entrance of the chapel or choir; this is often of a very large size, says the 'Glossary of Architecture,' and when complete is like other crucifixes, accompanied by the figures of Saint John and the Blessed Virgin, placed one on each side of the foot of the cross; but these are more often omitted. The rood loft was the gallery in which the cross was set to view, and the rood-arch was the arch between the nave and the chancel, that is, the arch over the rood-loft. Rood-lofts became common in England in the 14th century, were ordered taken down by the government in the 15th and 16th centuries, and temporarily were restored under Queen Mary. See the Irish Constitution of 1635, p. 110.

**Rood.** See WEIGHTS AND MEASURES.

**Rood-screen,** a screen of wood, stone, or wrought iron, separating the western end of the ritual choir from the nave in many churches, and forming a support for the rood, a cross or cru-

cifix, placed in the centre of the rood-beam. Sometimes the rood-screen was double with vaulting between and a rood-loft over it, as at Southwell Cathedral. It was frequently ornamented with niches in which were placed statues, as at York Minster and Rochester Cathedral.

**Roof,** the covering of a building by which the interior secures protection. In ordinary acceptance the term includes the covering and the supporting framework, though in carpentry the term is applied only to the framework. Roofs are broadly distinguished as flat or sloping. The former were used almost exclusively among ancient peoples and are at present employed largely in Eastern countries where the roof is

FIG. 1.

devoted to some extent to domestic purposes. The sloping roof, being to a great extent an ornamental consideration, has given way to the flat roof in modern business buildings, where economy of construction prevails. Flat roofs are usually covered with tar, metal, asphalt or gravel. The framework of the roof has, until the modern application of iron to this use, been almost exclusively of timber; and the end desired has been to arrange the timbers in such relations as to secure the greatest strength and stiffness consistent with the minimum of weight; also to avoid lateral strain or thrust upon the walls. The form chosen has been that of two or more inclined planes for the slopes of the roof over the enclosed space. Two inclined planes are formed by a series of sloping rafters having the lower ends tied together to prevent spreading. The upper ends forming the angle of the roof and connected by the ridge-piece. The method of tying the rafters is by a horizontal beam laid across the span, receiving at each end the foot of one of the rafters, the two being securely mortised. This is called a tie-beam. When the roof is of wide span it becomes necessary to secure the tie-beam against settling in the middle, and this is done by joining the centre of the tie-beam and the ridge angle of the rafters by a king-post (A in Fig. 1).

Sometimes two vertical beams are suspended from the rafters to the tie-beam, and these are called queen-posts (BB in Fig. 2).

FIG. 2.

Braces or struts (c) may be carried from the foot of the suspended posts to the rafters to afford additional stiffness to the frame. Further support is given to the rafters in roofs of long span by one or a series of transverse

## ROOFING TILES—ROON

longitudinal beams called purlins. Early Christian basilicas, of which San Miniato in Florence is typical, had roofs of the character just described. When the period of Gothic architecture was reached the king-post and tie-beam was carved and molded, in cases where wooden roofs were used instead of stone vaulting. Open timber roofs were used in England more than on the Continent for churches and halls. The finest example is that of Westminster Hall (Fig. 3) completed in 1399 and having a span of 68 feet.

modifications of these general forms are known by a variety of names.

The recent use of iron for roof-frames has become very general, especially where wide spans are required as in the case of railway train sheds. The general principles of construction employed in wooden frames are utilized in iron ridge roofs; but for oval or conical roofs, the iron trusses require a consideration of the principles governing those of bridge trusses. See BRIDGES.

The covering of sloping roofs is of various material, such as thin slabs of stone, thatch, tiles, slate, metal, shingles and cement.

**Roofing Tiles.** See TILES.

**Rook**, a European crow (*Corvus frugilegus*), having the base of the bill, forehead and upper part of the throat naked. The rook possesses a voice much less harsh than that of the crow. Rooks are gregarious in habits, and nest in great communities or rookeries, thus differing from other species of the family. The nests, which are placed in tree tops, are built or repaired early in March, and the young are hatched in April. The food consists chiefly of grubs, although grain appears to form part of the dietary. In Great Britain the rook is a permanent resident or partial migrant, but in other parts of Europe these birds appear to be more or less strictly migratory. The same species is found in Asia, where related species having the facial feathers only partially deciduous also occur.

**Rooke**, rûk, Sir George, English admiral: b. 1650; d. 24 Jan. 1708-9. At an early age he entered the royal navy, and in 1694 became one of the lords commissioners of the admiralty and admiral. He distinguished himself in the fight against the French and Spanish fleets in Vigo Bay (1702), and at the capture of Gibraltar in July 1704. On 9 Aug. 1704 he fell in with a French fleet of much superior force, under the Comte de Toulouse, off Malaga, and an engagement, which lasted nearly the whole day, ensued. Victory remained with the English, though none of the French ships were captured. The news of the Malaga victory reached England during the celebration over Blenheim, and Rooke's name was put forward for honors along with Marlborough's; but being a Tory he suffered from the jealousies of the Whigs, the dominant power. His command was taken away from him and he retired in disgust to his family seat in Kent.

**Rookwood Pottery.** See POTTERY.

**Roon**, rôn, Albrecht Theodor Emil von, Prussian soldier: b. Pleushagen 30 April 1803; d. Berlin 23 Feb. 1879. He entered the army in 1821; was attached to the Topographical Bureau in Berlin, 1833-5; became captain in 1836, and major in 1842; in 1848 became chief of staff of the 8th army corps at Coblenz, took part in the campaign at Baden of that year; and was promoted lieutenant-general in 1859. In the latter year he was appointed a member of a commission on the reorganization of the army. He had given special attention to this subject for many years, but his proposals which were in effect an extension with modifications of Scharnhorst's system, embracing a universal three years' service and a reserve were carried only after long opposition. The Austrian war of 1866 demonstrated that value of his sys-

FIG. 3.

In this example the central part of the tie-beam is cut away, and the great rigidity of the framework prevents any inordinate thrust upon the walls.

The inclination or pitch of the roof seems to be regulated by taste, after the general law is observed that countries of moist climate require a sloping roof to carry off the rain and snow. The slope of a Greek pediment, marking that of the roof, varied from  $15^{\circ}$  to  $16\frac{1}{2}^{\circ}$ ; Roman roofs, the roofs of Romanesque buildings, and also those of the Renaissance era, generally carried an inclination increased one quarter to that of Greek buildings. The Gothic pitch sometimes reached to  $50^{\circ}$  or  $60^{\circ}$ . But since the period of the prevalence of one particular style, great latitude has been observed, Germany and the Netherlands favoring a steep roof, and France retaining a moderately steep inclination even in her Renaissance structures; but England has tended toward the lowering of the pitch.

The commonest form is the gable roof where each end terminates in a gable. Modifications of this are the curb-roof in which the slope is broken; further distinguished as the gambrel roof where only two opposite sides are sloping; the French roof where the slope beneath the curb approaches almost to verticality and that above is nearly flat or with a slightly visible slope; the Mansard roof, named after its designer, Mansard, where the slope beneath the curb is pierced by dormer windows. The hipped roof is one having a double pitch and no gables, and the ridge shorter than the parallel wall plates. The pyramidal roof is one where the ridge is so short as to approach a point. Various

tem. He attended the German emperor throughout the Franco-Prussian war, and was created a count in 1871. The ministry of war which he had held since 1859 he resigned in 1871 together with the ministry of marine, held since 1861. In 1872 he succeeded Bismarck as president of the Prussian cabinet and was made field-marshal shortly after; but soon resigned. He was the author of several works on geography published between 1832 and 1839.

**Roos, Johann Heinrich**, German painter: b. Otterberg, in the Palatinate, 27 Oct. 1631; d. Frankfurt-on-Main 3 Oct. 1685. He came to Amsterdam and applied himself to landscape and animal painting. After a visit to Italy he settled finally at Frankfurt. Most of his landscapes are in the conventional Italian style.

**Roosa, Daniel Bennett Saint John**, American ophthalmologist: b. Bethel, N. Y., 4 April 1838; d. 8 March 1908. He was graduated from the University of New York in 1860, served as assistant surgeon in 1861 and became resident surgeon at the New York Hospital in 1862. He studied in Europe and in 1864 began practice in New York. From 1863-82 he was professor of diseases of the eye and ear at the University of New York, 1875-80 at the University of Vermont.

**Roosevelt, rô-zê-vêlt, Nicholas J.**, American inventor: b. New York 27 Dec. 1767; d. Skaneateles, N. Y., 30 July 1854. He engaged in manufacturing and inventing in New York and was connected with Robert R. Livingston and John Stevens in experimental boat-building. In 1798 he conceived the idea of a vertical wheel, a suggestion which made steam navigation a success. The first experiment was made in a boat launched in 1802 and propelled by the vertical wheels. In 1809 he was associated with Fulton in the introduction of steamboats into western waters and in 1811 built and launched the New Orleans with which he made a pioneer trip down the Ohio and Mississippi rivers in 14 days. He obtained letters patent from the United States government in 1814 protecting his invention, but was denied protection by the New Jersey legislature. Fulton never claimed the invention as his own, but Roosevelt's title to it has never been legally proved.

**Roosevelt, Robert Barnwell**, American author and politician: b. New York 7 Aug. 1829; d. Sayville, L. I., 14 June 1906. He was admitted to the bar and practised law in New York until 1871, when he was elected to Congress. In 1868 he was appointed minister to the Netherlands and served two years. His most important public service, however, was in the establishment of the United States Fish Commission, of which measure he was the originator and promoter while in Congress.

**Roosevelt, Theodore**, American politician and author, 26th President of the United States: b. New York 27 Oct. 1858. He was educated privately and at Harvard, from which he was graduated in 1880; then for a year traveled in Europe, which he later at intervals revisited; and in 1881 published his first book, 'The Naval War of 1812,' characterized, like his subsequent works, by creditable research, general accuracy, and vigorous statement. He came into politics as a champion of civil-service principles. In the autumn of 1881 he was elected to the State assembly of New York from the 21st district, and he served in that body continuously until

1884. He introduced into the assembly the first civil-service bill, passed in 1883. In 1884 he was chairman of the New York delegation to the national Republican convention. He was nominated in 1886 as an independent candidate for the New York mayoralty, but, though he received Republican endorsement, was defeated by Abram S. Hewitt (q.v.), candidate of the United Democracy, who was elected by about 22,000 plurality. In May 1889 he was made by President Harrison a member of the United States civil-service commission, in which post he continued until May 1895. During this six years' incumbency he strictly endeavored to apply the test of merit to all executive positions, with the result that the commission assumed a position of importance it has never since lost, and civil-service law gained a new vitality. At the beginning of his term of service, 14,000, at its close, 40,000, employees held their positions under the rules of the civil-service. From the civil-service commission he resigned to become president of the board of New York police commissioners during the administration of Mayor Strong. At once he undertook the task of thorough reorganization. Among the principles insisted on by him was an impartial application of the civil-service idea to appointments to the police force and promotions in it. By his rigorous enforcement of laws and ordinances he gave unwonted effectiveness to the office. This post he relinquished in 1897 to become assistant-secretary of the navy to Secretary John D. Long (q.v.). In the first administration of President McKinley. Quickly acquiring the extensive detailed knowledge necessary to his post, he began to urge that preparation of the navy for warfare which contributed so signally to the triumph of American arms in the Spanish-American war. He called for two appropriations of respectively \$800,000 and \$500,000, for ammunition for naval target practice; and though this was at the time deemed extravagant, it was later amply justified by the skill of American gunners as shown at Manila and Santiago. On 6 May 1898 he resigned his assistant-secretaryship to enter the army. His experience in 1884-8 in the 8th regiment N. Y. N. G., in which he had for a time served as captain, furnished some basis for his military career. He joined Leonard Wood (q.v.), captain and surgeon, U. S. A. (now major-general, U. S. A.), in recruiting the 1st United States volunteer cavalry, of which he became lieutenant-colonel, with Wood as colonel. Notwithstanding he was second in command, his regiment, composed to a large extent of cowboys and western hunters, was popularly known as "Roosevelt's Rough Riders." On 1 July 1898 he led the victorious charge of the "Rough Riders" and the 9th cavalry up San Juan hill, on 11 July was promoted colonel and in September was mustered out. On 27 September he was nominated as Republican candidate for the governorship of New York obtaining 753 ballots to 218 for Governor F. S. Black (q.v.). He entered on an active campaign, and was elected by a plurality of 18,079 over his Democratic opponent, Judge Augustus Van Wyck (q.v.). He at first declined to sanction the use of his name in connection with the vice-presidency in McKinley's second campaign, but ultimately yielded, and was nominated by acclamation at the national Republican convention at Philadelphia 21 June 1901. He immediately set out on an aggressive speaking tour, extend-

## ROOSEVELT DAM — ROOT

ing to the Far West. The assassination of President McKinley placed him in the Presidential chair. On 14 Sept. 1901 the oath of office was administered by United States District Judge John R. Hazel. Upon his accession he announced that he would unbrokenly continue the policy of McKinley, whose cabinet he retained. In November 1904 he was elected for the full term by a plurality of over 2,000,000 votes, the largest plurality ever given any Presidential candidate. Almost immediately after the expiration of his second term of office as President of the United States (23 March 1909), Mr. Roosevelt, with a large party and ample equipments, sailed for the wilds of Africa to hunt the beasts of the Jungle and otherwise to divert himself. Numerous specimens of game and fauna were shipped to the Smithsonian Institution, which outfitted the expedition.

Returning to civilization in the spring of 1910, Roosevelt passed through Egypt, Italy, France, Belgium, Austria, Germany, Holland, Denmark, Norway, and Sweden—every large country of Europe save Russia—being everywhere received with honor. He lectured to audiences in Egypt, Germany, France, England, and Norway, where he was awarded the Nobel Peace Prize on account of his share in promoting peace negotiations between Russia and Japan. Before he had reached England in his homeward trip, President Taft appointed Mr. Roosevelt envoy extraordinary to represent the United States at the funeral of Edward VII. In London he was given the freedom of the city, and there addressed the Englishmen on their Egyptian policy—an address which aroused considerable comment, as did his earlier lecture to the students at Egypt. In France he discussed his favorite race-suicide views, and in Berlin lectured on "Biological Analogies in History." Roosevelt returned to America 18 June 1910 and was enthusiastically greeted by the citizens of New York. In 1912 he was nominated at Chicago for President by the Progressive National Party (q.v.) and entered upon an active campaign, speaking in many states. On 14 October, at Milwaukee, he was shot and dangerously, though not fatally, wounded by John Schrank, who had followed him from city to city, intending to assassinate him.

He has written: 'Hunting Trips of a Ranchman' (1883); a 'Life of T. H. Benton' (1886); a 'Life of Gouverneur Morris' (1887); 'Ranch Life and the Hunting Trail' (1888); a 'History of the City of New York' (1890); 'Essays on Practical Politics' (1892); 'The Wilderness Hunter' (1893); 'The Winning of the West' (1889-96); 'American Ideals' (1897); 'The Rough Riders' (1899); a 'Life of Oliver Cromwell' (1900); 'The Strenuous Life' (1900); 'California Addresses' (1903); 'Maxims of Theodore Roosevelt' (1903); 'Addresses and Presidential Messages' (1904). He wrote also in 'Hero-Tales from American History' (1895; with H. C. Lodge); and 'The Deer Family' (1902; with several others). The best of his books is 'The Winning of the West,' the narrative of the conquest of United States territory west of the Alleghenias. Consult: Leupp, 'Roosevelt, the Man' (1904); Bigelow, 'President Roosevelt' ('Contemporary Review,' vol. 80, 1901); Rod, 'Le Président Roosevelt d'après son Œuvre Littéraire'

('Correspondant,' vol. 205, 1901); Brooks, 'President Roosevelt' ('Fortnightly Review,' vol. 81, 1904); Riis, 'Theodore Roosevelt, the Citizen' (1904).

**Roosevelt Dam**, the greatest engineering work in connection with the Salt River irrigation project in Arizona, which ranks first among the works of the United States reclamation service, was completed in 1910. This wonderful structure of sandstone and cement, costing nearly \$9,000,000, rises 284 feet above Salt River. It is 1,080 feet long on top and 170 feet thick at the base. Its foundation covers one acre of ground. Placed by the side of a twenty-story building, it would rise ten feet above it, while its length on top would be more than two city blocks. Across its top is a roadway twenty feet wide. The reservoir created by the Roosevelt dam is the largest artificial body of water in the world. Its capacity is sixty-one billion cubic feet, and if its water were spread over the State of Delaware it would cover the entire surface of the State a foot in depth.

**Root**, root or rüt, **Elihu**, American lawyer and statesman: b. Clinton, N. Y., 15 Feb. 1845. He was graduated from Hamilton College in 1864, and from the New York University Law School in 1867. In the latter year he was admitted to the bar and entered upon the practice of his profession in New York. In 1883 he was appointed United States District Attorney for the southern district of New York; in 1894 was a delegate-at-large to the New York State Constitutional Convention, and was chairman of the judiciary committee. He was appointed Secretary of War by President McKinley in 1899 and reappointed in 1901. He found the work of his department in disorder with constant rivalry among its various bureaus, but by strict discipline, adherence to civil-service rules, and establishing a system of promotion for merit, he soon brought order into the administrative departments, and turned his attention to the organization of the army. In this field he brought about a number of improvements, chief among which are the assimilation of the militia with the regular army and the creation of the General Staff. He also had charge of the military administration of Cuba and the Philippines, and while he was severely criticised for not trying to prevent cruelties in the conquest of the Philippines, he must also be given credit for the policy of the army in enforcing sanitary measures, and preparing for independent government in Cuba; and for the restoration of order and preparation for civil government and the work of the Philippine Commission in the Philippines. In January 1904 he retired from the secretaryship to resume the practice of law. On 19 July 1905 he was appointed Secretary of State. In 1909 he was elected United States Senator from New York, and in 1912 was elected permanent chairman of the Republican National Convention at Chicago.

**Root**, George Frederick, American musician and song-writer: b. Sheffield, Mass., 30 Aug. 1820; d. Bailey's Island, Maine, 6 Aug. 1895. He removed to New York where he taught in 1844-50, studied in Paris for a time in 1850, and in 1850 went to Chicago where he became a member of the music-publishing firm of Root & Cady. He was the originator of normal musical institutes and did much to im-

THEODORE ROOSEVELT,  
TWENTY-SIXTH PRESIDENT OF THE UNITED STATES.

## ROOT—ROPES

prove the standard of music in this country, founding a school of distinctively American music. His song 'The Battle-Cry of Freedom' (1861) gained immediate popularity and at one time 14 printing-presses were engaged in printing it. 'Tramp, Tramp, Tramp, the Boys are Marching' (1864), though written so nearly at the close of the war, nevertheless gained a wide sale. In a catalogue of 114 war songs 36 were from his pen. Among his songs are; 'Hazel Dell' (1853); 'Rosalie, the Prairie Flower' (1855); 'Just Before the Battle, Mother' (1863); 'Old Potomac Shore'; etc. He also wrote the quartet 'There's Music in the Air' and the cantatas 'The Flower Queen' (1852) and 'The Haymakers' (1857).

**Root**, that part of a plant which, normally, penetrates the soil, absorbs water and chemicals in solution, for nutritive purposes, forces it through the plant, and also acts as an anchor and support. Roots, however, may also, in modified forms, draw nutriment from other vegetation, or from the air, and may even serve as support and aid to climbing-plants. Low forms of vegetation, and certain submerged aquatics able to absorb water through most of their tissues, have no roots, or only enough to act as anchors.

The primary form of root is that which, starting from the germinating seed, secures it to the ground, and strikes downward into the soil, sending off horizontal branches which in turn branch, until the ground occupied by the fibrous reticulation is thoroughly exhausted of food. In many cases, however, this single central tap-root, so-called, is missing, and numerous horizontal and lateral roots take its place. The growth of the root-system is commensurate with that of the plant above ground. In epiphytes, the roots either adhere to the site of the plant, to hold it in place, or depend freely in the air, drawing nourishment therefrom.

Plants are called annuals, biennials or perennials, according to the length of time the root lives, but the differences are not always absolute, and are often changed by cultivation. Biennials and perennials, especially the former, are apt to have thickened, tuber-like roots, in which nourishment is stored during the growing periods, to be drawn upon when the plant flowers, as in beets and carrots.

Each root is a naked organ, incapable of bearing leaves, which has a blunt apex shielded by a root-"cap" more or less distinct, of old and firm cells. The growing cells of the root lie directly behind this cap, and still further back is a zone of delicate tubular root-hairs, which are devoted to the absorption of liquid foods from the soil, and are constantly dying off and being renewed on the side next the root-cap. The growing tip with cap and root-hairs, continually pushes forward into the soil, while the older portions become inactive so far as absorption is concerned, thicken, envelop themselves in cork, and increase their means of conducting water from the region of the root-hairs to the rest of the plant.

Roots may be produced from stem-nodes, branches, or even leaves (as in begonia), and are then called adventitious. A familiar example of this is found in the aerial roots of banyan and mangrove, which start from the branches

and eventually penetrate the ground, and which not only assist in feeding the trees, but also help to support their gigantic heads. Vines, such as the poison-ivy, have masses of aerial rootlets springing from the stem and fastening it firmly to its support.

The haustoria of certain parasitic plants are a form of reduced roots, and are special organs of absorption which "arise from the internal tissues of the parasite, and possess, in a marked degree, the capability of penetrating to a considerable depth into the body of the host plant by means of solvent ferments and the pressure resulting from their own growth." Once there, they draw sustenance from their host, and often dispense with assimilative organs of their own.

Other parasites have disk-like haustoria upon their root-systems, which fasten upon the roots of other plants, and, although appearing above ground like self-supporting herbs with green foliage, vigorously assimilative, these plants do not reach full development without this clandestine connection. The young roots of saprophytes, or plants living upon the decaying remains of vegetation, seem to require the co-operation of fungi in obtaining food.

The connection of bacteria and leguminous plants is becoming well known. The bacteria penetrate through the root-hairs of the *Leguminosae*, into the cortex of the root and there raise tubercular growths while living on the carbohydrates furnished by the host. But these bacteria, capable of fixing free nitrogen, furnish the host plant with a steady supply of nitrogenous food. The tubercles are most numerous on legumes growing in poor soil, and by plowing the legumes under the ground they decay, returning the nitrogen to the soil in a form available for the next crop. This process is called green manuring, and is a good treatment for exhausted, non-nitrogenous soils.

**Root**, in philology. See SCIENCE OF LANGUAGE.

**Root and Branch Men**, in British politics, a party in the House of Commons and out of it who supported a petition signed by 15,000 London citizens, praying that episcopacy might be destroyed "root and branch." Nathaniel Fiennes, Sir Harry Vane, and Hampden were of the party. A bill to give effect to the petition was read a first and second time in 1641, but was ultimately dropped.

**Root-worm**. See GRAPE INSECT-PESTS.

**Rope**. See CORDAGE.

**Ropes**, Arthur Reed ("ADRIAN ROSS"), English dramatist and poet: b. Lewisham, Kent, 23 Dec. 1859. He was educated at Cambridge. Among his numerous dramatic productions are: 'Faddimer' (1889); 'In Town' (1892); 'Gaiety: a Greek Slave' (1898); 'San Toy' (1899); 'The Messenger Boy' (1900); 'Gaiety: a Country Girl' (1902). He has also published: 'Poems' (1884); 'Short History of Europe' (1889); 'On Peter's Island' with Mary E. Ropes (1901); etc.

**Ropes**, John Codman, American military historian: b. Saint Petersburg, Russia, 28 April 1836; d. Boston, Mass., 28 Oct. 1899. He was graduated from Harvard in 1857, and from his admission to the bar in 1861 until 1870, practised law in Boston, but devoted the remainder of his

life to historical writing. As the founder of the Military Historical Society of Massachusetts he started the movement for the collection of historical data relating to the Civil War by the United States Government. He spent much time also in the collection of material bearing upon the life of Napoleon. His published books are: 'The Army Under Pope' (1881); 'The First Napoleon' (1885); 'The Campaign of Waterloo' (1893-4); and 'The Story of the Civil War' (1894-9).

**Rops, rôps, Félicien**, Belgian artist: b. Namur 1833; d. 1898. His illustrations for the 'Crocodile,' a journal published at Brussels, appeared for the first time in 1855 and established his reputation as an artist of original genius. But his main employment from that date was book illustration, and many novels of the day have been published with his brilliant pictures, which reflect the cynical spirit of some modern literature with great imaginative power. Many of his drawings are, however, too sheerly naked and unreserved to be pleasing. But his etchings are almost unique in power of execution, especially the series known as 'Sataniques' which while they belong to decadent art are masterpieces of technique. He founded the International Society of Etchers at Brussels and has had a great influence on modern schools of art in Europe. Consult Ramiro, 'Catalogue de l'Œuvre Gravé de Félicien Rops' (1887).

**Roque, rôk**. Croquet and roque are two varieties of the same game. Croquet is played upon a grass lawn on which the boundaries of a rectangular court are indicated by a chalk line, or by a slight ridge. Roque is played on a specially prepared earth court, with the corners cut off diagonally, the borders curved upward and bounded by india-rubber cushions. In each game the object of each player is to drive his playing ball, by means of a mallet, through a series of iron arches, each in its proper order, and from the proper side, and to strike a peg driven into the ground for that purpose, in the fewest number of 'turns' at play. After the first stroke a player may continue, if he has by that stroke either run through the proper hoop or hit another ball with his. In the former case he may try at another hoop, in the latter he must take his own ball to that which he hit with it, and, after placing them side by side, hit his own ball in such a manner that the impact of the blow will move the two. After that he may attempt to run through the next arch, or to hit some other ball with his. Should he fail in any shot he loses his 'turn,' and his opponent takes up the play.

In croquet the size of the court has varied a good deal, with a tendency to become smaller; 80 feet long by 45 feet wide is a usual measurement, but that depends upon the number of hoops or arches used, which may vary from six to ten; and upon their position with regard to each other. The preferable arrangement is that known as the 'Championship' or 'Six hoop' plan. The croquet balls are three and five eighths inches in diameter, and weigh fourteen and a half ounces each. The mallets vary from two feet nine inches to three feet in length. The width of the arch of the hoops is three and three quarter inches. Any number of couples of players may play, up to four.

Roque is a much more scientific variety of the game. The court is 72 feet long and 32 feet wide, rectangular, with each corner, for eight feet, cut off diagonally. The surface is well rolled dirt sprinkled with sand. It is surrounded with rubber cushions, so that caroms can be made off the balls the same as they are in billiards. All the arches, of which there are eight, are three and a half inches in diameter. In the centre of the court is a tunnel or cage the arch of which is three and one eighth inches, and it is 18 inches in length. The balls are of hard rubber and are three and a quarter inches in diameter. The mallets' heads are seven and a half inches long, by two and a quarter to two and a half inches in diameter, with a handle from 8 to 15 inches long. Only two players play against each other, each playing two balls.

Both games have elaborate rules which must be studied carefully to obtain a full appreciation of either game. Croquet is the descendant of the old game of 'Pall Mall,' popular in England up to 1700; but that game died completely out of knowledge, except in a remote corner of Ireland, from whence it emerged as croquet in the middle of the 19th century. It became a very popular game in Great Britain, from whence it passed to America and became equally popular. In both countries it suffered a partial eclipse on the introduction of lawn tennis. It is played in the west on grass as croquet and in the east on the courts above described as roque. For croquet rules, etc., consult 'The Complete Croquet Player' (1896); for roque consult Spalding, 'Athletic Library' (1893).

**Roquefort, rôk-fôr**, France, a village in the department of Aveyron in the vicinity of which large quantities of the well known variety of cheese of the same name is made from ewe milk.

**Roqueplan, Joseph Etienne Camille**, zhô-zêf ä-tê-ên kä-mêl rôk-plân, French painter: b. Mallemort, Bouches-du-Rhône, France, 1802; d. 1855. He studied at Paris under Gros and Pajol. His two pictures exhibited at the Salon of 1827 and illustrative of Sir Walter Scott's writings won him a place among the leaders of modern French painting. His most remarkable works include 'The Amateur Antiquary'; and 'The Well near the Tall Fig-Tree.' He was equally successful in genre and landscape, and his faithful transcripts of Pyrenean scenery are among the most delightful of modern French pictures.

**Roquette, rô-kêt**, Otto, German author, critic and poet: b. Krotoschin, Posen, 19 April 1824; d. Darmstadt 18 March 1896. Educated at Heidelberg, Berlin, and Halle, he taught at Dresden until his 39th year, at Berlin in 1862-9, and then in the Darmstadt Technische Hochschule, where he was professor of German language, literature, and history. He wrote an excellent history of German literature (1872; 3d ed. 1879); the novels, 'Im Haus der Väter,' 'Das Buchstabenbuch der Leidenschaft,' and 'Die Prophetenschule'; two volumes of dramatic poems (1867-76), and lyrics and tales.

**Roraima, rô-rä'-mä**, a mountain of South America, in lat. 5° N, on the boundary of British Guiana and Venezuela. It is 8,740 feet high, the top forming a rugged rocky plateau, and the steep rocky sides render the summit almost

inaccessible. It was ascended in 1884 by Mr. Everard im Thurn. The flora and fauna of the summit are scanty.

**Rorer, Sarah Tyson**, American teacher of domestic science: b. Richboro, Pa., 18 Oct. 1849. She was graduated from the academy at East Aurora, N. Y., and was married in 1871 to W. A. Rorer. She was for many years principal of the Philadelphia School of Domestic Science, and has lectured widely. She was editor and part owner of 'Table Talk' in 1886-92, edited 'Household News' in 1893-7, and since then has been on the editorial staff of the 'Ladies' Home Journal.' She is also director of the Pennsylvania Chautauqua School of Domestic Science. Her publications include: 'Mrs. Rorer's New Cook Book'; 'How to Use a Chafing Dish'; 'Colonial Cookery'; 'A Book on Diet and Cookery'; etc.

**Ror'ic Figures** (Fr. *figures roriques*, from Lat. *ros*, dew), a name applied to certain curious images rendered manifest upon breathing on polished solid surfaces, when these have been previously exposed to contact or close proximity of the objects thus represented, and usually at the same time acted upon by light, heat, or electricity. The singularity of these phenomena is, that they consist usually in the production at the first of a sort of latent or invisible image, but this may afterward be developed or brought out, somewhat in the manner of photography.

**Rorke's (rórks) Drift**, Africa, a post station on the Tugela River, in Natal, memorable for the heroic defense of a British force of 80 men under Lieutenants Bromhead and Chard. They were guarding the hospital and the commissariat, when they were attacked by a Zulu force of 4,000, the night of 22 Jan. 1879. The British used biscuit boxes and rice bags for a barricade, and kept the enemy at bay until relieved the morning of the 23d. Six times in succession the little force drove out Zulu warriors who had got within the barricade.

**Rorqual, rór'wál**, a name which is of Scandinavian origin, and signifies a whale having longitudinal furrows on the belly. As generally employed, it comprises the finback, sulphurbottom, and humpback whales, or the subfamily *Balenopterina*, exclusive of the genus *Rhachienectes*. The sulphurbottom is a particular kind of finback, characterized by great size, a mottled coloration, and various osteological peculiarities. In the North Atlantic there are three species of finbacks, one species of sulphurbottom, and one species of humpback. The finbacks are the common finback (*Balenoptera physalus*), the pollack whale (*B. borealis*), and the little piked whale (*B. acuto-rostrata*). The whale which is most frequently seen on the east coast of the United States, and of which stranded individuals are found every year at different points, is the common finback, *B. physalus*. It is from 60 to 70 feet long when full-grown, and is readily distinguishable by its gray and white striped whalebone, gray upper surfaces, and white belly, and under surfaces of pectoral fins and flukes. The dorsal fin, which is rather more than a foot high, is situated a little in advance of the last fourth of the length of the body. Though numerous

species of finbacks and humpbacks have been described from different parts of the world, the five forms above mentioned are everywhere recognizable. If others exist they at least resemble these very closely. The sulphurbottom feeds on small crustaceans, and the finbacks and humpbacks on various fishes, such as the cod, pollack, herring, capelin, etc. They all engage in seasonal migrations. During the summer months great numbers congregate about Newfoundland, Iceland, and the north of Norway. For gray whale, or hardhead, and further information relating to finbacks and humpbacks, see **WHALE**.

**Rory O'More, rór'í ó-mór'**, a novel by Samuel Lover, published in 1836. In spite of its stilted style and improbable incidents, this story is valuable in its delineation of Irish character, and in its picture of the Irish uprisings at the close of the 18th century.

**Rosa, róz'á**, Carl Augustus Nicholas (originally Rose), German opera conductor: b. Hamburg 22 March 1842; d. Paris 30 April 1889. He studied violin playing at Leipsic, made a tour at 12; and gained the violin prize at the Paris Conservatoire. He came to America as conductor of Mr. Bateman's concert tour, and met the singer Euphrosyne Parepa, to whom he was married in 1867. His opera company, headed by Mme. Parepa-Rosa, included Wachtel, Santley, Ronconi, and Formes. In 1871 he became manager of the Carl Rosa Opera Company in London and produced operas in English both in London and in the provinces until his death.

**Rosa, róz'á**, Salvatore or Salvator, Italian painter: b. Renella, near Naples, 20 June 1615; d. Rome 15 March 1673. His eldest sister having married Francesco Francanzano, a painter, Salvator from him acquired a taste for art. He then became a pupil of Falcone and Ribera (q.v.). But his taste was formed by the study of nature among the wilds of the Apennines rather than by other artists. During one of his rambles in the Abruzzi he was seized by brigands with whom he is said to have associated for some time, but left them at last and went to Naples, where he worked in such want that he was often obliged to sell his pictures to the meanest hucksters and for a pittance. At last one of his pictures was observed by the painter Lanfranco, who recommended Salvator to notice, and procured him patronage. He removed to Rome, where he established his reputation. In 1647, when the revolt under Masaniello occurred, he joined *La Compagnia della Morte*, which Falcone commanded, and on the defeat of the cause he returned to Rome, where he was not, however, permitted to remain. He went to Florence, where he was patronized and employed by the grand duke and other members of the family of Medici. At length, returning to Rome on the death of his enemies, he painted many pictures for the churches in that city. His great ambition was to be a famous historical painter, but he is actually best known as a painter of landscapes and battles. His landscapes present wild and desolate scenery; with rocks rising like towers, broken, splintered tree trunks waving their leafless arms; storm and lightning convulse the heavens, and the figures introduced are those of bandits, soldiers, or witches. Among

## ROSA AMERICANA—ROSARIO

his extant works are: 'Prometheus,' 'Belisarius,' 'St. Roche Wounded,' some landscapes and battle-scenes, in Rome; 'Jesus Disputing with the Doctors,' 'Daniel in the Lions' Den,' 'Jesus Walking on the Water,' in Naples; 'Souls in Purgatory,' in Milan; 'Conspiracy of Catiline,' and his own portrait, in Florence; 'The Soldiers of Gideon,' 'Bandits in Council,' 'St. Jerome in the Desert,' and some landscapes, in Munich; 'Mercury and the Woodman,' 'Landscape with Figures,' in the National Gallery; 'Moses at the Rock,' 'Halt of the Soldiers,' at Hampton Court; 'Prometheus,' 'Sisyphus,' at The Hague; 'Regulus,' 'Cadmus,' at Copenhagen; 'The Prodigal Son,' in St. Petersburg; 'The Angel Raphael' and 'The Young Tobias,' 'The Shade of Samuel Appearing to Saul,' in the Louvre; 'Jesus in the Garden of Olives,' 'Resurrection of Christ,' in Toulouse. He was distinguished as a poet and musician and his satires and other poems have been often printed.

**Rosa Americana**, in numismatics, the name applied to a coinage issued in 1722 by Great Britain for America of a mixed metal resembling brass, and called *Rosa Americana* or Wood's money, after its manufacturer, William Wood. The royal letters patent described this money as two-pence, pence, and half-pence. See NUMISMATICS.

**Rosa, Monte**, mōn'tē rō'sā (ancient *Mons Sylvis*), a mountain of the Alps (q.v.), on the boundary between Italy and Switzerland, near the Matterhorn, and about 40 miles east of Mont Blanc (q.v.). It is formed by the union of several mountain ridges. Where the ridges meet four chief angles are formed, the one on the northeast, which is most precipitous, enclosing the glacier of Macugnaga, another on the northwest originating the great Gorner glacier or glacier of Zermatt, a third on the southwest containing the glacier of Lys, and the fourth on the southeast occupied by several large but less prominent glaciers. The loftiest peak, Dufourspitze, 15,217 feet in height, was first ascended in 1855. There are three other peaks, respectively 15,132, 15,005, and 14,965 feet high.

**Rosaceae**, rō-sā'sē-ē, the Rose family, a natural order of herbaceous plants, shrubs, and trees, with alternate simple or compound leaves accompanied at their base by two persistent stipules. Many of our commonest edible fruits belong to this order, such as strawberries, raspberries, brambles, plums, apples, quinces, cherries, almonds, peaches. They have a calyx of one sepal, with four or five divisions, and the corolla has as many petals as the calyx has divisions, but is sometimes wanting. The stamens are generally very numerous and distinct, and are inserted with the petals round the ovary. The pistil presents various modifications. Sometimes it is formed of a single carpel or several entirely free and distinct carpels, placed in a tubular calyx. Sometimes these carpels adhere by their outer side to the calyx; sometimes they are united, not only to the calyx, but to each other; and sometimes they are collected into a kind of capitulum or head. The fruits, consequently, are highly varied, and their modifications afford the chief distinguishing marks of the sub-orders. In Engler and Prantl's 'Pflan-

zenfamilien' the *Rosaceae* are divided into 19 tribes, and these tribes are grouped in six sub-orders. The sub-order *Spiraoideae* comprises the tribes *Spiraea* (queen-of-the-meadow), *Quillaja* (soap-tree), and *Holodisceae*. The tribe *Pomoideae* (apple, pear, etc.), forms a sub-order by itself. Under the sub-order *Rosoideae* are classed the tribes *Kerria* (*Kerria japonica*), *Potentilla* (raspberry, strawberry, etc.), *Cercocarpae*, *Ulmariae*, *Sanguisorbeae* (lady's-mantle, etc.), and *Roseae* (roses). *Neurodoideae*, *Prunoidae* (sloe, etc.), and *Chrysobalanoidae* (coco-plum), are tribes each of which constitutes a sub-order. The plants of this order are chiefly found in the cold and temperate climates of the northern hemisphere.

**Rosaceae**, *Acne Rosacea*, or *Gutta Serena*. See ACNE.

**Rosales**, rō-sā'lēs, Philippines, pueblo, province of Nueva Ecija, Luzon; on a tributary of the Agno River, two miles from its junction with the Agno; 38 miles north of San Isidro. It is connected by highway with Manila and with towns to the north. Pop. 11,519.

**Rosamond**, rōz'a-mōnd, English mistress of Henry II., commonly called 'Fair Rosamond.' She was the daughter of Walter, Lord Clifford, became the mistress of Henry II., and died probably about 1176. The king is said to have set apart for her residence a building surrounded by a labyrinth at Woodstock. The intrigue was finally discovered by the jealous Queen Eleanor, who forced her to drink poison. These details, however, have no historic basis. She was buried in the chapter-house of Godstow nunnery, where her tomb was long to be seen.

**Rosaniline**, a derivative of aniline (q.v.), the base of magenta, fuchsin (qq.v.), etc. It is a colorless substance, having the formula  $C_{18}H_{11}N_3$ . Many of its crystalline salts are of very brilliant colors.

**Rosario**, rō-sā'rē-ō, Argentina, in the province of Santa Fé, on the right bank of the Paraná, lies 160 miles northwest of Buenos Ayres. It is the second city of the republic in commercial importance, and the centre of the entire trade for the 11 provinces lying between Paraná and the Andes. Many handsome buildings are of recent construction, such as the new courts, theatre, banks, and hotels. Other improvements, such as telephone, and a new railway from the capital opening up a new and vast territory, adduce to its rapid development and progress, and it is virtually a rival of Buenos Ayres. Exports, agricultural products, were valued at more than \$5,850,000. Pop. about 118,000.

**Rosario**, Philippines, pueblo, province of Batangas; on the southeastern coast at the mouth of the Rosario River; 13 miles northeast of Batangas, the provincial capital. It is an important road centre. During the last insurrection the town was destroyed by the insurgents. Pop. 12,450.

Also the name of two smaller pueblos in Luzon: (1) in the province of Cavite, on the Manila coast road, eight miles southwest of the town of Cavite, pop. 6,390; (2) in the province of Unión, situated in a mountainous district, 30

## ROSARY OF THE BLESSED VIRGIN MARY — ROSCIUS

miles southeast of San Fernando, connected with coast highway; pop. 2,250.

**Rosary of the Blessed Virgin Mary**, a popular and highly approved form of devotion in the Roman Catholic Church. It consists in the recital of 15 decades of Ave (see *AVE MARIA*) each decade preceded by a Paternoster and followed by a Gloria (see *DOXOLOGY*): as the prayers are said, they are counted off on a string of beads. Five decades form a chaplet and in each chaplet are contemplated events or "mysteries" connected with the life of Christ: the mysteries of the first chaplet are, the Annunciation, Visitation, Birth of Christ, his Presentation in the Temple, and his Finding there: these are the Joyful Mysteries. In the other chaplets are contemplated the Five Sorrowful Mysteries — the Agony in the Garden, Scourging, etc.; and finally the Five Glorious Mysteries — Resurrection, Ascension, etc. The Rosary of 15 decades was introduced by St. Dominic in the 13th century.

**Rosary Sunday**, the first Sunday in October; a feast instituted by Gregory XIII. for the Confraternity of the Rosary, and made of universal observance after the victory of the Emperor Charles VI. over the Turks at Lepanto in 1571, in gratitude to the Blessed Virgin. This victory is supposed to be in answer to the prayers of the Fraternity of the Rosary, a Roman Catholic order established in the 15th century for the purpose of averting public calamity by the means of prayers. An impetus was also given to the devotion of the rosary by Leo XIII., who enjoined its daily use in public during October. Roses are blessed and distributed as souvenirs, and the rosary is recited continually during the day.

**Rosas, Juan Manuel de**, hoo-án' mi-noo-él dá ró'sáa, Argentine dictator: b. Buenos Ayres 30 March 1793; d. near Southampton, England, 14 March 1877. He was descended from a noble family of Spain and first came into public notice as leader of the republicans against the aristocratic party of the Unitarios. He was commander of the police of Buenos Ayres in 1826, but the revolution headed by Lavalle forced him to retire. He succeeded a little later in overcoming Lavalle and becoming governor, 1829-32. Though forced out of office he held control of the army and in 1835 became dictator for five years. His appointment was twice renewed and until 1852 no meetings were held of the national congress or the constituent assembly. Rosas exercised a despotic rule and attempted to annex the neighboring states by force under the pretext of their formerly belonging to the vice-royalty of Buenos Ayres. He took advantage of the rivalry of Oribe and Rivera to intervene in the affairs of Uruguay, made an unsuccessful invasion in 1839 after the fall of Oribe's government and repeated the attack in 1843. A long siege followed and the closing of the Paraná to navigation, and the violation of the treaties of 1828 and 1840 finally led to combined interference on the part of England and France. Buenos Ayres was blockaded, but little was effected save the opening of the Paraná, as the river provinces could not be induced to rise against Rosas. England withdrew in July 1848 and France six months

later. The opposition party against Rosas was growing more powerful, however, and the treaty of 1849 which denied to the neighboring provinces navigation privileges of the Plate, the Uruguay, and the Paraná finally brought to his opponents the support of Brazil, and Rosas was defeated at Monte Caseros, 3 Feb. 1852. He made his escape to England, where he lived the remainder of his life. The Argentine congress passed sentence of death upon him in 1861 as "a professional murderer and robber."

**Roscelin**, rôs-él-ân, Rousselin, or Rucelin, Jean, French theologian of the 11th century: b. probably in the diocese of Soissons. He was educated at Rheims, and came into public notice while canon of Compiègne by citing Anselm as supporting his view of the Trinity, which in effect conceived God as existing as an individual and consequently the Trinity as three Gods. The synod of Soissons in 1092 compelled Roscelin to recant, after receiving from Anselm a refutation and denial of Roscelin's position and claims. Continuing to teach his peculiar views he was deposed. He went to England to attack Anselm, then archbishop of Canterbury, at the opportune moment of his difference with the king, but failing in his purpose returned to France. Later he settled at Tours and entered into a controversy with Abelard, his former pupil, on the grounds taken by the latter in maintaining the unity of the Trinity. After this controversy Roscelin disappears from history. Of his writings only a letter to Abelard is extant. In the history of philosophy he is classified as a nominalist and in theology as a tritheist.

**Roscher**, rôsh'ér, Wilhelm, German political economist: b. Hanover 21 Oct. 1817; d. Leipzig 4 June 1894. Following Savigny, who introduced into Germany the historical treatment of jurisprudence, Roscher broke with the theoretical economists and entered on the study of the history of economics, treating political economy less as an abstract science and more as a branch of history, and making economic fact and past development rank mere economic ideas and theories. From 1848 he was professor at Leipzig. His two great works are: 'System der Volkswirtschaft' (1854-81); and 'Geschichte der Nationalökonomik in Deutschland' (1874).

**Roscius**, rôsh'ŭs, Roman actor: b. Colonium, near Lanuvium, 134 B.C.; d. about 61 B.C. He was born a slave and early adopted the histrionic profession for his master's profit. His success on the stage was phenomenal. It is said that at one time he earned 1,000 denarii (about \$175) daily, and Pliny estimates his annual profits at 50,000,000 sesterces (about \$2,000,000). This may be exaggerated, but he was a favorite actor at a period when the Roman passion for the stage was at its height. He was easily enabled to purchase his freedom from his *peculium*, or perquisites as a slave, took the name of Quintus Roscius Gallus, and wore the emblem of equestrian rank, a gold ring, given him by Sulla. The Roman populace and nobles he moved with equal facility to tears or laughter by his irresistible histrionic power, for while he was a tragedian unparalleled in the history of the ancient Roman stage, he was also a comedian of fresh and natural humor. Cicero did not disdain to receive instructions from the great

actor, whom the first orator of Rome always spoke of in terms of affection and admiration.

**Roscoe, rōs'kō**, Sir Henry Enfield, English chemist: b. London 7 Jan. 1833. He was educated at University College, London, and at Heidelberg, making a special study of chemistry. He occupied the chair of chemistry at Owens College, Manchester, in 1857-87, since when he has been emeritus professor there. He was knighted in 1884, sat in Parliament for South Manchester in 1885-95, and in 1896-1902 was vice-chancellor of the University of London. He has received high honors from the universities and learned societies of England and has published: 'Investigations on the Chemical Action of Light'; 'Lessons in Elementary Chemistry' (1871); 'A Treatise on Chemistry' (1878-89); 'The Hydrocarbons and their Derivatives,' with Schorlemmer (1881-92); etc.

**Roscoe, William**, English biographer: b. near Liverpool 8 March 1753; d. Toxteth Park, Liverpool, 30 June 1831. At 16 he was articled to an attorney in Liverpool, and this obliging him to study Latin, he read and made himself master of the Latin classics. He next studied the Italian and French languages, and in the former became uncommonly proficient. Having finished his clerkship, he was taken into partnership by an attorney of considerable practice and carried on the whole of his business. In 1777 he published a collection of some of his earlier poems and when the question of the slave-trade came uppermost Roscoe took a warm part in favor of its abolition, and joined Clarkson in his endeavors to that end. His 'Scriptural Refutation of a Pamphlet on the Licitness of the Slave-Trade' and his 'Wrongs of Africa,' appeared in 1788; and in 1796 he brought out the work which gained him celebrity, the 'Life of Lorenzo de' Medici, called the Magnificent' (1795), since translated into Italian, French, and German. About 1797 Roscoe retired from the practice of an attorney, and entered himself as a student of Gray's Inn, with a view to the bar. He published the 'Life and Pontificate of Leo X.' in 1805, and in 1806-7 represented Liverpool in Parliament. He had previously entered into business at Liverpool as a banker, a move which eventually landed him in great pecuniary difficulties. He was the author of several political pamphlets, and the mover and supporter of several public works in Liverpool. To the botanic garden and to the Athenæum he lent much effective assistance. Consult his 'Life and Correspondence' (1833) by his son, Henry Roscoe.

**Rose, rôz**, Channocy, American philanthropist: b. Wethersfield, Conn., 24 Dec. 1794; d. Terre Haute, Ind., 13 Aug. 1877. In 1825 he settled in Terre Haute as a merchant, where by his investments in land he became wealthy. He was an active promoter of railroad interests and was especially interested in the Terre Haute and Indianapolis Railroad. Though legally entitled to the fortune of his brother John he disposed of almost the entire amount of \$1,600,000 in benevolent enterprises which he knew his brother to have favored, and later founded from his own fortune the Rose Polytechnic Institute to which he left the greater share of his estate.

**Rosa, Frank H.**, English engineer and journalist: b. Lambeth, England. He was educated in the London elementary schools and in the night classes, served as an engineer's apprentice in 1872-8, and then joined the Lambeth Society of Amalgamated Engineers. He gained a considerable influence over industrial thought of the day, was almost constantly an officer in the Amalgamated Engineers, living in Liverpool and in Manchester in 1893-1903 as a district organizer, since when he has entered upon a political and journalistic career.

**Rose, George** ("ARTHUR SKETCHLEY"), English dramatist and novelist: b. London, England, 19 May 1817; d. there 11 Nov. 1882. He was graduated from Oxford in 1845, took orders in the Church of England in 1848, and after holding several curacies became in 1855 a Roman Catholic. He then engaged in tutoring and later devoted himself to a literary career in which he achieved a considerable success. His 'Mrs. Brown' monologues were published in 32 volumes (1866-70) and enjoyed wide popularity. His other works include: novels, 'A Match in the Dark' (1878); and 'A Marriage of Conscience' (1879); plays, 'The Dark Cloud' (1863); 'How Will They Get Out of It?' (1864); 'Money Makes the Man' (1870); and also several works of travel, 'The Great Country, or Impressions of America' (1868); 'Out for a Holiday' (1870); etc.

**Rose, rôz'e**, Gustav, German mineralogist, brother of Heinrich Rose (q.v.): b. Berlin 28 March 1798; d. there 15 July 1873. He studied under Berzelius at Stockholm, in 1822 became keeper of the mineralogical collection in the University of Berlin, and in 1826 was made extraordinary and in 1839 ordinary professor of mineralogy in that institution. Beside several essays in Poggendorff's 'Annalen,' he wrote 'Elemente der Krystallographie' (1833); 'Ueber das Krystallisationsystem des Quarzes' (1846); 'Das krystallochemische Mineralsystem' (1852). With Humboldt and Ehrenberg he made in 1829 a journey to northern Asia, an account of which he gave in a work entitled 'Reise nach dem Ural, dem Altai und dem kaspischen Meer' (1837-42).

**Rose, Heinrich**, German chemist: b. Berlin 6 Aug. 1795; d. there 27 Jan. 1864. He first devoted himself to pharmacy, studied in Berlin, in Stockholm in 1819 under Berzelius, and from there went to Kiel, where he took his degree. In 1823 he became extraordinary and in 1835 ordinary professor of chemistry at Berlin. As a practical analyst in the department of inorganic chemistry he holds a high rank, and the result of his labors can be found in his memoirs inserted in the 'Annalen' of Poggendorff. His 'Manual of Analytical Chemistry' (1829) was translated into French, English, and Swedish. In 1844 he discovered a new metal in the tantalites of Bavaria which he called niobium.

**Rose, rôz**, Sir Hugh, LORD STRATHKERN, English diplomatist: b. Berlin 8 March 1803; d. Paris 16 Oct. 1885. He entered the British army in 1820, was military attaché to the Turkish army in 1840, was consul-general for Syria 1841-8, as secretary to Lord Stratford de Redcliffe was *chargé d'affaires* at Constantinople in 1852-4, and was commissioner at the French

## ROSE—ROSE OF JERICHO

headquarters during the Crimean war. He was sent to India in 1857 to command the Central Indian army, and virtually reconquered Central India. Though his campaign was overshadowed by that of Sir Colin Campbell, it is generally admitted that his operations were more skilful and brilliant than his chief's, on whose death he became commander-in-chief in India. He held the same post in Ireland 1865-70, was raised to the peerage in 1866, and made field-marshal in 1877.

**Rose, Hugh James**, English theologian: b. Little Horsted, Sussex, 1795; d. Florence 22 Dec. 1838. He was graduated from Trinity College, Cambridge, in 1817; and elected professor of divinity to the University of Durham in 1833. He was one of the leaders of the Oxford movement, and it was at his rectory, Hadleigh, Suffolk, in July 1833, that a resolution was made to publish 'Tracts for the Time.' 'He was,' says Dean Church, 'the most accomplished divine and teacher in the English Church. He was really a learned man. He had the intellect and energy and literary skill to use his learning. He was a man of singularly elevated and religious character; he had something of the eye and temper of a statesman, and he was profoundly loyal to the Church.' It is not too much to say that by his early death the Tractarian movement lost its balance wheel. See OXFORD MOVEMENT. Consult: Church, 'The Oxford Movement' (1891); Mozley, 'Reminiscences.'

**Rose, Sir John**, Canadian financier: b. Turiff, Aberdeenshire, 2 Aug. 1820; d. Caithness-shire 26 Aug. 1888. He was educated at King's College, Aberdeen, and in 1836 removed with his parents to Canada. He served as a volunteer during the rebellion of 1837, in 1842 was admitted to the bar, and soon established a large practice at Montreal. He entered Parliament as member for Montreal in 1857, and after the Union until his retirement in 1869 represented Huntingdon. He was solicitor-general in 1857, minister of public works in 1859, and in 1864 was appointed commissioner for the settlement of claims under the Oregon treaty with the United States. In 1867-9 he was minister of finance, then retired from office, went to England and engaged in banking. He represented the English government on a confidential mission to the United States which led to the treaty of Washington in 1870, and until his death was regarded as the unofficial representative of Canadian interests in England. He was created a baronet in 1872 and in 1886 became a privy-councillor.

**Rose, Attar of** See ATTAR.

**Rose-breasted Grosbeak.** See GROSBEEK.

**Rose-chaffer.** See GRAPE INSECT PEST.

**Rose Festival**, a peculiar kind of festival which is celebrated annually on 8 June in some French villages. A similar gala-day is celebrated in Los Angeles, Cal., annually in June.

**Rose-mallow.** See HIBISCUS.

**Rose-noble**, an English gold coin of the value of \$1.65, first struck by Edward III, in 1334, and so called because it was of the same value as the noble, a money of account, and was stamped on one side with the figure of a

rose. It ceased to be coined in the reign of Henry V.

**Rose, Order of the.** See ORDERS, ROYAL.

**Rose Polytechnic Institute**, an institution of collegiate grade at Terre Haute, Ind. Its organization was begun as early as 1874, but it was not opened to students until 1883. It is governed by a board of nine members, of whom one is an alumnus elected by the alumni. The institute offers four courses, each of four years' duration. They are in mechanical engineering, electrical engineering, civil engineering and architecture, and chemistry. From the first the practical work in the institute shops has been an important feature of the curriculum. The degree of bachelor of science is conferred for the completion of any of these courses; that of master of science, two years after graduation if one year is spent in graduate study; the degrees of mechanical engineer, electrical engineer, or civil engineer are conferred upon those who have the master's degree after two years' successful professional work. The grounds and buildings of the institute are valued at \$145,000, the library contains 15,000 volumes (1910). The original endowment from the founder, Chauncey Rose, was over \$500,000, and additions to this fund have since been made; the annual income in 1910 was \$42,000. The students numbered 200, and the faculty 22.

**Rose Window**, a circular window, divided into compartments by mullions and tracery radiating from the centre, also called Catharine wheel and marigold window according to modifications of the design. It forms a fine feature in the church architecture of the 13th and 14th centuries, and is mostly employed in the triangular spaces of gables. In France it is much used, and, notwithstanding difficulties of construction, attained great size. Notable examples are found in the windows in the cathedrals of Amiens, Chartres, Paris, and in that of Rheims Cathedral, which is over 40 feet in diameter.

**Rose-wood**, the commercial name for chestnut-colored, dark-veined woods, brought chiefly from Brazil, of varying origin, but mainly the product of *Dalbergia nigra*, one of the *Leguminosae*. It is imported, not in logs or planks, since the large heart-wood rots easily, but in segments, and is sold by weight, being valued according to its richness of color. When cut it gives out a faint rose-odor, and is fine and hard, takes a high polish, and is much in demand for cabinet making and pianos, being used solidly and in veneer, although somewhat difficult to work on account of its resinous veinings.

**Rose of Jericho**, or **Resurrection Plant**, a small, annual, cruciferous plant (*Anastatica hierochuntica*) which grows in the desert regions about the Red Sea. It bears minute white flowers succeeded by tiny pods, containing a few seeds. When the seeds are ripe, the leaves fall off, the branches curl inward and interlace, enclosing the pods still holding their seeds, and become dry and rigid, causing the plant to assume the form of a ball, ready to be blown hither and thither by the winds of the dry season. When the plant is deposited in a damp place, it exercises its remarkable hygroscopic powers, rapidly uncoils, and lets the seed escape

## ROSE OF LIMA—ROSEBURY

in soil suitable for germination. This habit of curling up when dry, and rapid absorption of water, forcing the apparently dead limbs to spread open, as if alive again, has caused the plant to be collected and sold as a curiosity.

**Rose of Lima, Saint**, a religious woman of Spanish America: b. Lima, Peru, 1586, d. there 24 Aug. 1617. Her baptismal name was Isabel, but from her fine complexion she was given the name of Rose. She early showed herself resolute in avoiding the self-indulgence of society and the world. As a symbol of the life she had chosen she planted her garden only with bitter herbs and interspersed them with figures of the cross. In her religious exercises she took the great mystic, Catharine of Siena, as her model. When her parents fell into poverty she was taken into the family of the treasurer Gonsalvo, by the devout wife of that gentleman, and by her labor day and night supplied the necessities of her parents. When she was importuned by her friends to marry, she refused, and as her duty to her parents forbade her taking the veil, she emphasized her refusal by joining the Third Order of Saint Dominick, and the religious strictness and exalted piety of her life was an example which won the admiration, sometimes the imitation, of the worldly and profane. On her death the chapter of the cathedral, the senate, and all the most honorable companies of the city took turns in carrying her body to the grave. She was canonized by Clement X. in 1671 and 30 August was appointed for her festival.

**Rose of Lippe, The.** See **ORDERS, ROYAL.**

**Rose of Sharon**, a name given to an ornamental malvaceous shrub, the *Hibiscus syriacus*. But the rose of Sharon of the Bible was doubtless a bulbous plant, probably a kind of narcissus. See **HIMISCUS.**

**Ro'scate Spoonbill.** See **SPOONBILL.**

**Roseate Tern.** See **TERN.**

**Rosebery, rôz'bér-l, Archibald Philip Primrose, EARL OF**, English statesman and author: b. London 7 May 1847. He was educated at Eton and Oxford; became Earl of Rosebery in 1868; as a member of the House of Lords entered his political career without the advantage of a training in the Commons, but soon proved himself a brilliant debater; in 1872 was a commissioner on Scottish endowments; and was successively rector of the great Scottish universities of Aberdeen (1878-81) and Edinburgh (1882-3). From August 1881 to June 1883 he was under-secretary of state for the home department, in 1884 became first commissioner of works, and in 1886 was appointed secretary of state for foreign affairs in Gladstone's government. He was generally approved for his skilful treatment of the difficult questions connected with the war between Bulgaria and Servia, and the coercion by the European concert of Greece, then threatening war with Turkey. He was also one of the firmest supporters in the Upper House of Gladstone's first Home Rule bill. With the defeat of the bill, and of the government at the general election, he passed from office. He soon, however, entered upon a new activity, and one with which up to his time peers had been supposed to have nothing to do,—namely the municipal business of London.

Upon the organization of the London county council, a representative body, chosen by popular suffrage and responsible to the public, he at once enlisted himself in the service of the improved system of government promised thereby, on 17 Jan. 1888 became a member of the council, and on 12 February was made its chairman. In June 1890 he resigned. Following his example, many others of rank and prominence entered the council, whose work was raised to an important position in English public life. For some months in 1892 he was again president of the council. Upon Gladstone's accession to power in that year, he once more became secretary for foreign affairs. He maintained a strong advocacy of Imperial federation; made in September 1894 a notable and characteristic speech before the Lords on the Home Rule bill, which, though passed by the Commons, was thrown out by the Upper House after a four-days' discussion; and brought to a satisfactory end the serious coal strike of 1893. When Gladstone finally retired from political life in 1894, Rosebery was summoned to form an administration, notwithstanding that there were other Liberals whose length of service was thought by many to give them precedence. Many influential Liberals objected, too, it was said to a prime minister without the House of Commons. No remarkable events attended his administration. The Liberal majority was not large; and before long there were evidences of an increasing division within the party, due in large measure to opposition to his supposed imperialistic views. His government was once or twice discomfited, and finally on 21 Jan. 1895 was defeated in the committee on army estimates. He resigned on 22 January and became the leader of the Liberal opposition. In October 1896 he resigned this position. He had made several of his finest speeches, but found himself at odds with many of his party. In May 1898 he spoke on Gladstone before the House of Lords, and in 1899 was elected lord rector, and in 1908 chancellor of Glasgow University. He is distinguished for his many and varied attainments, and as a ceremonial and commemorative orator is unequalled in England. Marked characteristics of his speeches are their literary quality, derived from a very extensive reading, and that skilful irony whose presence he has so admirably indicated in the writings of Stevenson. As an author, he is known for his 'Life of William Pitt' (1891), already becoming a sort of classic; a 'Life of Sir Robert Peel' (1899); and 'Napoleon: The Last Phase' (1900), a most careful and interesting narrative of the captivity at St. Helena, with a severe arraignment of English blunders in the treatment of the emperor. Consult the 'Life and Speeches' (1900) by Coates, a eulogy throughout; also the collection, 'Appreciations and Addresses' (1899). See **GREAT BRITAIN, History.**

**Roseburg, rôz'bér-g, Ore.,** city, county-seat of Douglas County; on the Umpqua River, and on the Southern Pacific railroad; about 300 miles south of Portland. It is the commercial and trade centre for the fertile valley of the Umpqua, in which farming, fruit-growing, stock-raising, and mining are carried on. The chief manufactures are flour, dairy products, canned

## ROSECRANE—ROSENTHAL

fruits, beer, wagons and carriages. It has the Oregon State Soldiers' Home. Pop. (1910) 4,738.

**Rosecrans**, rō'st-krānz, William Starke, American soldier: b. Kingston, Ohio, 6 Sept. 1819; d. near Redondo, Cal., 11 March 1898. He was graduated at West Point, entering the army as 2d lieutenant of engineers in 1842, but in 1844 returned to West Point as assistant professor of engineering. From 1847 to 1854 he superintended the repair of various harbors on the eastern coast, but resigned his commission in the last named year, and retired to private life in Cincinnati, where he became a consulting engineer and architect. He entered upon his career in the Civil War in the volunteer army, his first service being the organization of the Ohio troops. From colonel of the 23d Ohio Volunteers, he was promoted brigadier-general, U. S. V., in May 1861, and 23 June was placed in command of three brigades under McClellan in the campaign of western Virginia, where he was victor in the battles of Rich Mountain and Carnifax Ferry. He served in the Department of Western Virginia until he succeeded Gen. Pope in command of the Army of the Mississippi. After successfully defending Corinth in western Tennessee during the siege of 11 June 1862, he was put in command of that district by Gen. Grant, with headquarters at Jackson, Tenn. His memorable career as commander of the Army of the Cumberland began in October 1862, and in June 1863 he moved upon the Confederate army under Gen. Bragg, whose forces he had been holding in intrenchment during the Northern victory at Vicksburg, causing Bragg's retreat over the Cumberland Mountains to Chattanooga. In the battle of Chickamauga, 19-20 Sept. 1863, Rosecrans was badly defeated. He was soon after transferred to the Department of the Missouri, and in 1864 relieved of his command. He retired to Cincinnati, where he remained until 1868, when he was appointed minister to Mexico. In 1865 he was brevetted major-general in the United States army. In 1881-5 he represented California in Congress. From 1885 to 1893 he was register of the United States Treasury, and his beautiful signature is to be seen on the treasury notes of that period. He was restored to the rank of brigadier-general and placed on the retired list of army officers in 1898.

**Rosefish**, a large red fish (*Sebastes marinus*) of the rockfish family (*Scorpenidae*), taken numerous on far northern coasts, where it frequents shallow shore-waters, while southward it remains at considerable depths. It bites readily to hand or trawl lines, its flesh is good and it is profitable for market as it reaches a length of two feet. Its color is orange-red. Many local names belong to it, as red perch, snapper, Norway haddock, hemdurgan, etc. The rosefish feeds upon crustaceans, small fish, and mollusks; and the young, at least, are among the most important food-resources of cod and halibut.

**Rosemary**, a shrubby, strongly aromatic plant (*Rosmarinus officinalis*), growing wild in the southern parts of Europe and also cultivated. It belongs to the Mint family (*Labiata*) and has axillary, pale blue flowers with two stamens.

The stem is three or four feet high, bearing opposite, linear and sessile leaves with revolute margins which are dark-green, smooth and shining above, white and cottony beneath. Rosemary is tonic and slightly stimulant, and formerly enjoyed considerable repute as a medicine. It yields, by distillation, a light pale essential oil of great fragrance, which is used in hair pomades. The herb is also used for seasoning in Italy. Rosemary is often referred to in folk-lore: it was supposed to restore youth when eaten; it was woven into brides' wreaths, and otherwise employed at weddings, and was carried to funerals and thrown on the graves, because, as it did not soon fade, it was a symbol of remembrance. "There's rosemary, that's for remembrance."

**Rosenau**, rō'st-now, William, American rabbi and educator: b. Wollstein, Germany. After coming to America he studied in the public schools of Philadelphia and Cincinnati and was graduated from the Hebrew Union College in Cincinnati in 1889. He was rabbi in Omaha, Neb., 1889-92, and has been rabbi in Baltimore since 1892. He has been instructor and is now associate in rabbinics at Johns Hopkins University and among his publications are: 'Semitic Studies in American Colleges'; 'Hebraism in the Authorized Version of the Bible'; 'Jewish Ceremonial Institutions and Customs.'

**Rosendale**, rō'st-nāl, N. Y., village in Ulster County; on the Rondout River, the Delaware & Hudson Canal, and the Walkill Valley Railroad; about eight miles south by west of Kingston (q.v.). It is noted for its manufacture of hydraulic cement (q.v.). Most of the cement derived from the natural cement rock, in the United States, comes from Rosendale. Pop. (1910) 1,125.

**Rosenfeld**, rō'st-fēlt, Sydney, American dramatist: b. Richmond, Va., 26 Oct. 1855. Educated in the public schools of Richmond and New York, he early displayed a fondness for literature and play-writing, and some of his dramas have won fair success. Among the plays of which he is author in whole or in part are: 'The Senator'; 'A Possible Case'; 'A House of Cards'; 'The Passing Show'; 'Lady or Tiger.' He has also adapted 'The Black Hussar'; 'Nanon'; 'Prince Methusalem'; etc.

**Rosenthal**, rō'st-tāl, Max, American artist: b. Turck, Russian Poland, 28 Nov. 1833. At 14 he studied art in Paris, and coming to Philadelphia in 1849, he entered the Academy of Fine Arts, chromo-lithography being his specialty. In 1861 he followed the Army of the Potomac and executed drawings of every camp until Gettysburg. Some of his best work is seen in illustrated plates of the report of the United States Military Commission to the Crimea (1860) and in Dickinson's 'Numismatics of the United States.'

**Rosenthal**, Toby Edward, American painter: b. New Haven, Conn., 15 March 1848. He studied at Munich in the studio of K. Raupp (q.v.) and in 1868 came under the instruction of Piloty. After producing many genre pictures he attracted attention by his 'Sebastian Bach and his Family at their Morning Devotions' (1870), which was purchased by the Leipzig Museum. After a visit to his home in the United States he returned to Munich and painted 'Elaine the Fair' (1874) from Tennyson's idyll

at 'Elaine.' He also produced some humorous pictures, such as 'He Laughs Best Who Laughs Last' (two panels); and 'The Girls' Boarding School in Alarm' (1877). His name will be perhaps best remembered for his 'Trial of the Escaped Nun, Constance de Beverley' (from Sir Walter Scott's 'Marmion'); and 'A Dancing Lesson in the Time of the Empire.'

**Roseola**, any rose-colored rash occurring, usually in a symptomatic character, with some febrile disorder, as measles, scarlet fever, etc., or with gastric disturbances. The term is often applied, though inexact, to German measles and to mild forms of other diseases attended with a rash of similar appearance to that seen in roseola.

**Roses**, flowers of the type-genus *Rosa*, of the order *Rosaceae*. The species are exceedingly variable; probably no other genus calling forth so wide a range of botanical opinion. Most botanists recognize about 100 species, Bentham and Hooker estimate the number at less than 40; but Gandoger describes more than 4,000 as indigenous to Europe and western Asia. The number of horticultural varieties, crosses and hybrids is probably several times larger than in any other genus, more than 3,000 varieties are listed in French catalogues, and since new ones are added annually the list consists of active members. The roses are widely distributed in the temperate and cold parts of the northern hemisphere extending in the respective continents southward to India, Abyssinia and northern Mexico. They are erect, climbing or trailing shrubs, generally prickly-stemmed; bear alternate, odd-pinnate, though sometimes simple, leaves and generally large, showy, pink, white, yellow or purple flowers borne either singly or in terminal corymba, followed by generally showy berry-like fruits (hips) which contain several bony akenes. Probably no flower has played so important a rôle in the garden and in literature. It was prized in the cradle days of the Aryan race and is frequently mentioned in the writings prior to our era. China and Japan, however, seem to have been less attracted to it than more western races. In very early times the flowers exhibited their characteristic tendency to double; indeed, it is probably the first flower cultivated in this state, and is now more often thought of in this form perhaps than in its natural single form. The single roses are, however, useful and popular in park planting.

Except for ornamental purposes roses are of small importance; the only uses made of them are the preserving of the fruits of a few species for food and the manufacture of perfumes, especially attar or otto of roses and rose water from the flowers of some other kinds, principally *R. alba* and *R. damascena*, which are extensively grown in southeastern Europe, particularly Bulgaria and adjacent Asia and in southern France, in which last country the leading rose is the Provence, a hybrid variety of *R. centifolia*. The flowers are either put in stills or are macerated. In the distilling process the essential oil is extracted by steam and condensed. In each process there is considerable perfume in the water used and in the maceration process, which is most popular in France, this "rose water" is the product sought rather than the attar which is regarded as a by-product. These

perfumes are among the most important of the world, and it is said that the importations of the attar alone into the United States is greater than the importations of any citrus perfume such as lemon oil, oil of bergamot, etc.

Unquestionably the roses are the most important flowers cultivated. They are prized by every one who cares for flowers at all and throughout the civilized world are probably grown in more gardens than any other flowers. How important they are commercially appears by the statistics quoted in the article *FLOICULTURE* (q.v.). In the United States alone the number of blossoms annually grown for sale has been estimated at 100,000,000, valued at about \$6,000,000. Yet the development of this industry, which now demands the greatest skill of specialists, has sprung from insignificance in 1870; and in 1850 it did not exist.

From the botanist's standpoint the classification of Crépín in his 'Primitivæ Monographiæ Rosarum,' seems to be one of the most satisfactory and is followed by botanists perhaps more frequently than perhaps any other; from the gardener's standpoint Barron in the 'Cyclopedia of American Horticulture,' divides the roses into 19 groups with more or less subdivision. Among these the following are probably the most important. *Provence*, perhaps most familiar in America in one of its types, the fragrant globular flowered moss roses; *Damask* and *French*, fragrant-flowered, robust growing, hardy prolific roses; *Ayrshire*, very hardy climbing roses with solitary fragrant white to deep crimson flowers; *Briers*, small perishable-flowered garden roses more useful in shrubberies than for cut flowers; *Multiflora*, with large corymba of rather short lived flowers, and popularly known as ramblers, used largely in wild gardens, though the crimson Rambler and its sub-varieties which belong to the polyantha subdivision are used for porch decoration for which they are admirably adapted; *Evergreen*, the foliage continuing very late in autumn; for example, *R. Wichuriana*, a very popular hardy trailer which grows anywhere; *Hybrid perpetual*, upright growing, though sometimes pendulous, shrubs which bear flowers of all types and colors and embrace the largest number of varieties of any group but so greatly mixed as to preclude separation and definition; *Hybrid teas*, a group of the preceding, the members being the result of crosses with the Chinese tea-scented rose, especially rich in forcing varieties; *China* or *monthly rose*, a perpetual-blooming rose chiefly interesting because of its effect upon other roses by hybridizing through its variety the tea rose; *Musk*, very fragrant light colored rather tender roses best known in their derivatives, and noisettes, which blossom later, are hardier than the type, and will grow in any soil but are little used probably because the blending with the teas seems to have impaired their hardiness; *Polyantha*, perpetual-flowering multiflora climbing varieties bearing small flowers in clusters and especially promising as the parents of a nebulous group of varieties adapted to American requirements; *Perpetual briers*, best known in America by one of its component species *R. rugosa*, a hardy Japanese rose much used in exposed situations for hedges, screens, etc., and useful for hybridizing with many other species.

## ROSES

Rose species are propagated by seeds which are either sown as soon as the hips are ripe or are stratified in sand until spring. If allowed to become dry they may require two years to germinate, but if treated as above they generally sprout the first spring. Many species may be propagated by means of cuttings of nearly mature wood taken during summer and rooted under glass. Others will grow from mature wood cuttings taken in autumn and rooted in the spring like currants and gooseberries. Layering is generally practised with such species as do not root readily from cuttings; for example, *R. hemisphaerica* and *R. eglanteria*. Some species such as the cinnamon rose (*R. cinnamomea*), the Carolina rose (*R. carolina*) and the Damask rose (*R. damascena*), may be propagated by suckers, division or by cuttings of the roots which in the last case should be dug in autumn, stored in sand or sphagnum in a frost-proof cellar until spring when they are planted in nursery rows. Grafting and budding are also practised, but are frequently unsatisfactory where regular intelligent attention cannot be given to the removal of the suckers that generally spring from the stock. For greenhouses and for forcing cuttings of semi-mature wood are nearly universally used. They may be taken at any time, rooted with bottom heat in sand, and kept in pots until large enough to be transplanted upon the branches.

In general, roses thrive best upon loamy soils, rich in plant food and humus, well drained but moist, in situations sheltered from the wind but where they will receive the sunlight at least half the day. They do not generally succeed upon very loose or sandy soils, but often do upon heavy clays. They are seldom difficult to transplant with ordinary care, are easy to cultivate and generally simple to prune. The removal of weak and old wood is the most important pruning detail. But care must be taken especially with climbing varieties to preserve the long sturdy shoots, since they are most prolific of blossoms. Indoor roses cultivated for cut flowers are generally pruned so as to have the flowers borne singly at the ends of long stems sometimes, as in the case of American Beauty, exceeding 4 feet in length. But this is a special florist's practice and is dependent not only upon the method of pruning but upon the management of the plants otherwise. In the garden the plants may usually be set about 30 inches apart in beds about four feet wide, the plants of one row being preferably opposite the intervals of the other so as to obtain full light and air. Beds of this width need not be tramped on when the flowers are being gathered. Cultivation consists in keeping the surface loose and open at all times by raking, a rather shallow forking being given each spring. In the autumn a liberal mulch of stable manure should be spread upon the beds and the coarser parts removed in the spring before the annual forking. The removal of all dead, failing or puny shoots should precede the cultural operations. Many gardeners give applications of liquid manure just as the flower buds appear and preferably preceding a shower. When well managed a rose bed should be satisfactory for ten or more years.

A large number of insects feed upon the rose both out of doors and in the greenhouse.

Of those which sometimes prove troublesome in the garden the rose beetle or chafer is perhaps the most annoying, since it feeds upon the petals of the opening flowers, thus ruining them. The only remedy which has been satisfactorily applied is hand picking. Plant lice (see *APHIDS*) and scale insects (q.v.) are often found upon roses, but in the garden are not usually very troublesome. Slugs occasionally skeletonize the leaves by working upon the undersides and several caterpillars, beetles, etc., also live upon the foliage, usually, however, in insufficient numbers to do damage. In the greenhouse some of the above species may appear, but they are usually debarred by correct methods of management, especially as to ventilation, temperature and humidity. The red spider, not an insect but a mite, is sometimes troublesome where the air is allowed to become too dry. Management will also prevent the so-called plant diseases occasionally found in poorly ventilated houses; indeed, attention to the details mentioned is in many leading houses found more expedient and satisfactory than recourse to the so-called remedies for either insects or maladies.

Y., 1891); Vergara, 'Bibliografía de la Rosa' (Madrid 1892).

M. G. KAINS,  
Crop Expert.

**Roses, Wars of the**, the name given to the protracted struggle between the houses of Lancaster and York for possession of the English throne, in the second half of the 15th century. The appellation was derived from the badges adopted by the contending parties, a white rose by York and a red rose by Lancaster. The outbreak of the war was brought about by the growing discontent of the people with the evil fortunes of the war against France and the oppressive taxes necessitated by the heavy military expenditures. The imbecile Henry VI. (q.v.) had shown himself quite incapable of the tasks of government and this served to enhance the power of Richard, Duke of York, the representative of the claims of the house which had been driven from the throne in 1399 in the person of Richard II. The Duke of York's great opponent was Margaret, wife of Henry VI., a woman of great strength of character and much ability. The first battle of the war was fought in 1455 at St. Albans and resulted in a victory for the Yorkists whose head became, for the second time, protector of the realm. War broke out again in 1459 and began auspiciously for the Lancastrians. The Duke of York and the Earl of Warwick and Salisbury were compelled to flee the country. In June 1460, they returned, however, and defeated the Lancastrian forces at Northampton and took Henry VI. prisoner. A compromise was effected by which Henry VI. was to retain the crown until his death, when it was to pass to the Duke of York. Queen Margaret, however, would not consent to this wrong to her son, and continued the struggle. At Wakefield 30 Dec. 1460, the Yorkists were defeated and the Duke of York was killed and

soon after the Lancastrians gained a second victory at St. Albans. Edward, Earl of March, the Duke of York's eldest son, joining forces with Warwick succeeded in getting possession of London, which was a fervent supporter of the Yorkist cause, and was elected king, setting out immediately to meet the enemy on whom he inflicted a bloody defeat at Towton (29 March 1461). Henry VI. fled to Scotland and the remnants of Lancastrian resistance were crushed out at Hedgley Moor and Hexam in 1464. A quarrel between Edward IV. and the Earl of Warwick led the latter to embrace the Lancastrian cause. Returning from France with a large force in 1470 he compelled Edward to seek refuge in Holland. Henry VI. was released from captivity and replaced upon the throne. Edward IV., however, returned to England in the early part of 1471 and on 14 April decisively defeated Warwick at Barnet, the "king-maker" himself falling in the fight. On 4 May a Lancastrian force under Queen Margaret was overthrown at Tewkesbury and the young Prince Edward met his death there, most probably by assassination after the battle. Henry VI. died in the Tower a few days later and Edward IV. was securely established on the throne. The last battle in the long conflict was fought in 1485 when Henry of Richmond, representative of the Lancastrian claims, overthrew Richard III. (q.v.) at Bosworth Field and ascended the throne as Henry VII. By his marriage to Elizabeth, the daughter of Edward IV., he united in himself the claims of the rival houses. See ENGLAND, *Civil History*. Consult: Gairdner, 'Lancaster and York' (1886).

**Rosetta**, rō-zét'ta (Ar. RESHED), Egypt, a city near the mouth of the Rosetta Canal,—a branch of the Nile,—formerly the medium of communication between Cairo and Alexandria, which gave to Rosetta a commercial importance which it has lost by the opening up of other channels of traffic. From 1798 to 1807 Rosetta was captured in turn by the French, English, and Turks. Pop. 13,500.

**Rosetta Stone**, a slab of black basalt of ancient Egypt, now in the British Museum, chiefly noted as having furnished the key for the decipherment of the Egyptian hieroglyphics. The stone was discovered in 1799, during the excavation of Fort St. Julien, near Rosetta, Egypt, by M. Boussard, an officer of engineers in the French army of occupation. Three years later the stone was brought to England and deposited in the Museum. The stone was erected in 195 A.C. by the priests of Egypt in honor of Ptolemy Epiphanes and in commemoration of his remission of the dues of the sacerdotal body (q.v.). It bears an inscription duplicated in three languages, in Greek, in hieroglyphics or sacred, in demotic or common characters, and this fact enabled Dr. Thomas Young in 1818 and later, M. Champollion, in 1822, to decipher it in the three languages and thus furnish a key for the reading of the hieroglyphics (q.v.). The Rosetta Stone is 3½ feet long, 2½ feet wide, and nearly a foot thick. See ARCHÆOLOGY; HIEROGLYPHICS.

**Rosetta Wood**, an East Indian wood, of unknown origin, reddish orange in color, with darker veinings. The wood is close, hard and very beautiful when first cut, but soon becomes darker by exposure. It is used in fine cabinet work, and is imported in logs.

**Rosewater, Andrew**, American civil and sanitary engineer: b. Bohemia 31 Oct. 1848. After a course of study in the common and high schools of Cleveland, Ohio, he became flagman in the engineer corps of the Union Pacific Railroad, engaging in explorations and surveys in 1864 and later in other engineering positions on the same road. He was assistant city engineer of Omaha, Neb., 1868-70 and city engineer 1870-5. He was in charge of the construction of the Omaha and Northwestern Railroad 1878-80; was resident engineer of the Omaha Water Works Company, 1880-1, and from 1881-7 was city engineer. Between 1887 and '91 he was consulting and designing engineer of sewerage for 25 cities. Since 1897 he has been city engineer of Omaha and president of its board of public works.

**Rosewater, Edward**, American journalist b. Bukovan, Bohemia, 1841; d. Omaha, Neb., 31 Aug. 1906. Coming to America in 1854, he became a telegraph operator and for two years (1861-3) was in the United States military telegraph corps. In 1863 he went to Omaha, Neb., as manager of the Pacific Telegraph. In 1871 he was elected to the Nebraska Legislature. In 1871 he founded the *Omaha Bee*, and edited it till his death. He was vice-president of the Universal Postal Congress at Washington, 1897, and the original founder of the Omaha Trans-Mississippi Exposition (1898).

**Rosicrucians**, rō-zī-kroo'shī-anz, a real or imaginary secret society, the alleged existence of which became known unexpectedly at the beginning of the 17th century. Early in that century appeared several books concerning the society, which are now generally ascribed to Johann Valentin Andrea, a Lutheran clergyman, and among which is the 'Fama Fraternitatis R.C.' (1614). This work is the story of a certain holy and reverend Brother Christian Rosenkreuz, a German noble of the 14th century, who, inspired with the lofty ambition of reforming the world, spent a large portion of his days among the Brahmans, and in Jerusalem, Damascus, Egypt, Morocco, Fez, etc., in the pursuit of wisdom. Returning to Germany he founded an order, consisting of but few members, who met in a house erected by himself, and called Sancti Spiritus Domus, where he died at the age of 106. His burial-place was to be kept a secret by all the adepts, but he ordered the words 'Post CXX annos patebo' to be inscribed upon one of the doors of the house of the order. To this work was added another, 'Confession of the Society and Brotherhood of the Rosy Cross,' addressed to the learned of Europe. This tract declared that the order had no intention of interfering with the religious or political action of states, but only desired the improvement of mankind by the discovery of the true philosophy. Whether such a society ever existed is still an open question. Many will have us believe that the above treatises were meant by Andrea to satirize in serio-comic style the philosophical follies of the age, having no expectation of them being regarded otherwise than as fiction. The fraternity had fallen out of public attention for a long time, when in the latter half of the 18th century the interest in their organization was revived, especially by the noted impostor Cagliostro, who gave out that he was a Rosicrucian.

**Rosin**, or **Resin**, the name given to the resin of coniferous trees employed in a solid state for ordinary purposes. It is obtained from turpentine by distillation. In the process the oil of the turpentine comes over and the resin remains behind. There are several varieties of resin, varying in color from the palest amber to nearly black, and from translucent to opaque. It differs somewhat according to the turpentine from which it is derived, this being obtained from numerous species of pine and fir. It is used in the manufacture of sealing-wax, varnish, cement, soap, for soldering, etc. Colophony is a name for the common varieties. See **NAVAL STORES**.

**Rosmini**, rōs-mē'nē, **Antonio Rosmini-Serbat**, Italian philosopher: b. Roveredo in the Italian Tyrol, 25 March 1797; d. Stresa, 7 July 1855. He began the course of studies for the priesthood at Padua in 1817, and was ordained in 1821. He became deeply versed in philosophy, ancient and modern, and revolved in his mind a comprehensive system to serve as a basis for the truths of revelation, while on the practical side he planned an institution for the training of teachers and priests. From 1826 to 1828 he lived mostly in Milan, thought out the rule of his new order, visited Rome, gained the approval of Pius VIII. both for special studies and for the institution of his order, and published his 'New Essay on the Origin of Ideas' (1830).

After a few years of labor at Trent he settled in 1837 at Stresa on the west shore of Lago Maggiore and, surrounded by loving and devoted friends, sent volume after volume to the press. His dream in politics, as expressed in his 'Constitution according to Social Justice' (1848), was a confederation of the states of Italy under the Pope as perpetual president. For a brief period he basked in the papal favor, and was promised by Pius IX. a cardinal's hat; and on the Pope's flight to Gaeta, he followed, but now found the pontiff's mind turned against him and never afterward regained his confidence. His 'Constitution' and 'The Five Wounds of Holy Church' were next prohibited by an irregular meeting of the Congregation of the Index called at Naples. But in 1854 the Congregation of the Index, the Pope presiding, declared Rosmini's writings entirely free from censure, and enjoined perpetual silence on all his accusers. The 'Institute of the Brethren of Charity' survived its founder, and among the Rosminian Fathers, who are mostly Italians or Englishmen, are to be found at the present day some of the ablest and most devoted sons of the Roman Church. In England it has foundations at Ratcliffe, Loughborough, Cardiff, Wadhurst, Rugby, and established in 1876 its central house at St. Ethelreda's, Holborn, once the domestic chapel of the palace of the bishops of Ely.

The foundation of Rosmini's philosophy is being considered as the form of the intelligence—an elemental intuition of which is implanted by Nature herself. Intuition gives us ideas, of which we may affirm (1) that they are not nothing; (2) that they are not ourselves; (3) that they have a mode of existence of their own, entirely different from that of real or subsistent things, and independent of the bodily sense. Their two essential characteristics are universality and necessity; for real objects and sensations are always particular, instead of being

universal and generic, and every object which involves no contradiction is necessarily possible. These two characteristics involve two others, infinity and eternity, the origin of the ideas comes from God, for man does not receive them from the things themselves. The one indeterminate and wholly universal idea is that of being or existence; we cannot determine the subsistence of an object until we first have the idea of it, therefore perception involves the idea which is further isolated from all the other elements of the perception by the process of universalization, through which it may be realized an indefinite number of times. When the ideas are all fully or perfectly determined, they are called concrete; when they remain to a certain extent indeterminate, they are abstract. Being is incorporeal, independent of space, spiritual, and therefore incorruptible and immortal. It is independent of time; as being in its essence is always being, and as it would be a contradiction in terms for being to cease to be being, it is eternal. But since it was united to the soul in time, it must have existed before it and be independent of it. And thus we reach an Intelligence anterior to human intelligence—an Eternal Mind. This eternal mind is God's, and therefore God exists, and His existence and the immortality of the soul remain the true foundation of morals. Consult: Tommaso, 'Antonio Rosmini' (1835); Lockhart, 'Life of Antonio Rosmini' (1866); Werner, 'Rosmini und seine Schule' (1884); and, above all, Thomas Davidson, 'Philosophical System of Rosmini' (1882).

**Ross**, rōs, **Alexander**, British soldier: b. Scotland 1742; d. London 29 Nov. 1827. He entered the British army in 1760, and was made captain in 1775. He served as aide-de-camp to Lord Cornwallis in the war of the American Revolution, and arranged for his surrender at Yorktown. He afterward served with Cornwallis in India, and in 1812 attained the rank of general.

**Ross**, Alexander, Canadian fur trader and author: b. Mairnshire, Scotland, 9 May 1783; d. Manitoba 23 Oct. 1856. He emigrated to Upper Canada in 1805 where he was for some years a teacher. In 1810 he joined the fur-trading expedition of John Jacob Astor and established trading posts in the most isolated regions. He wrote the earliest and most graphic accounts of the Columbia and Oregon country, with the opening up of which he was for years identified. He also had a prominent part in the colonization of Manitoba. Among his works are: 'Adventures of the First Settlers on the Oregon and Columbia Rivers' (1849); 'Fur Hunters of the Far West' (1855); and 'Red River Settlement: Its Rise, Progress and Present State' (1856).

**Ross**, Alexander Milton, Canadian naturalist: b. Belleville, Ontario, 13 Dec. 1832; d. Detroit, Mich., 27 Oct. 1897. At 13 he came to New York, where he became a compositor on the *Evening Post* and a protégé of William Cullen Bryant. In 1851 he began to study medicine, and during the Civil War was a surgeon in the Union army, but rendered his greatest service to the cause as confidential correspondent to Lincoln in Canada. His subsequent life was chiefly devoted to the study of natural history, in the pursuit of which he has added valuable in-

formation concerning the fauna and flora of Canada. He published: 'Birds of Canada' (1872); 'Butterflies and Moths of Canada' (1873); 'Forest Trees of Canada' (1874); 'Ferns and Wild Flowers of Canada' (1877); 'Mammals, Reptiles and Fresh Water Fishes of Canada' (1878).

**Ross, Clinton**, American novelist: b. Binghamton, N. Y., 31 July 1861. He was graduated from Yale in 1884, and began his career in newspaper work in New York. He is the author of: 'The Silent Workman' (1886); 'The Speculator' (1888); 'The Adventures of Three Worthies' (1891); 'Improbable Tales' (1892); 'A Trooper of the Empress' (1898); 'Heroes of Our War with Spain' (1898); 'The Tale of Many Gods' (1903); etc.

**Ross, George**, American patriot: b. New-castle, Del., 1730; d. Lancaster, Pa., July 1779. On his admission to the bar in 1751 he settled in Lancaster, Pa. As a member of the Pennsylvania assembly 1768-70, he drew up the declaration of rights which was presented by the assembly to the proprietary government. He was a member of the Continental Congress from 1774-7, and as such was one of the signers of the Declaration of Independence. In 1779, three months before his death, he was made judge of the admiralty court of Pennsylvania.

**Ross, Sir James Clark**, English explorer: b. London 15 April 1800; d. Aylesbury, Buckinghamshire, 3 April 1862. He was a nephew of Sir John Ross (q.v.) whom he accompanied on the voyage in search of a northwest passage in 1818. Between 1819 and 1827 he accompanied Captain Parry upon his four Arctic explorations, and was a member of the expedition of his uncle in 1829-33. His discovery of the north magnetic pole in 1831 raised him to the rank of post-captain; but it was in his memorable voyage to the Antarctic Ocean in 1839-43 that he rendered his most valuable contribution to science. He succeeded in reaching lat. 78° 10', and discovered a great ice-bordered continent which he named Victoria Land, and an active volcano which was called Mount Erebus after the discoverer's ship. For these services he was knighted in 1844. In 1848 he was a member of the party which made an unsuccessful attempt to discover the fate of Sir John Franklin. He became rear-admiral in 1851. An account of his Antarctic expedition was published by him in 1847, entitled 'A Voyage of Discovery and Research in the Southern and Antarctic Regions.' Consult: O'Byrne's *Naval Biographical Dictionary*; Markham, 'Fifty Years' Work of the Royal Geographical Society.'

**Ross, Janet Anne Gordon**, English author: b. London 24 Feb. 1842. She was married to H. J. Ross, a banker of Alexandria, Egypt, in 1860, was for three years Egyptian correspondent of the *London Times*, and since 1867 has lived in Italy. She has published: 'Italian Sketches' (1887); 'Three Generations of Women' (1888); 'Leaves from our Tuscan Kitchen' (1899); 'Florentine Villas' (1901); etc. The two works last named have been reprinted in this country.

**Ross, John**, American patriot: b. Rosshire, Scotland, 29 Jan. 1726; d. Philadelphia, Pa., March 1800. After a mercantile experience

of 20 years in Perth, he emigrated to America at the beginning of the rebellion of its colonies, and became at once a staunch defender of the cause of independence. In June 1774, as chairman of the meeting of Philadelphia merchants in protest against British importations, he signed the agreement presented to the authorities and otherwise resisted unjust taxation.

**Ross, Sir John**, English Arctic explorer: b. Balsarroch, Scotland, 24 June 1777; d. London 30 Aug. 1856. He entered the navy at 9 and was promoted lieutenant in 1805. His first Arctic expedition was made in 1818, when, with Lieutenant Parry, he made a voyage in search of a northwest passage to the north pole. His second Arctic voyage was made in 1829 in a small vessel equipped at the expense of Sir Felix Booth, high sheriff of London, which proved inadequate for the purpose. The exploring party was frozen up in the ice for four winters, and was rescued in 1833 by Ross's old ship, the *Isabella*, in Lancaster Sound. He was knighted for his services in 1834, and made rear-admiral in 1851. In 1839 he was appointed consul at Stockholm, and served until 1845.

**Ross, John**, or *Kooweskoowe*, Indian chief: b. Georgia 1790; d. Washington, D. C., 1 Aug. 1866. He was a Cherokee half-breed who became chief of his tribe in 1828. In 1817-19 Georgia attempted to remove the Cherokees from its borders through a bribe offered to Ross, who had received an English education and was a man of importance in his tribe. He exposed the attempt and continued to repulse the concerted effort of the people of the State to effect their removal. In 1829 Ross, as chieftain, successfully appealed to the Supreme Court of the United States against the action of the Georgia legislature in expelling his people, nevertheless the Cherokees were banished in 1838.

**Ross, Jonathan**, American jurist and statesman: b. Waterford, Vt., 1826; d. Saint Johnsbury, Vt., 22 Feb. 1905. He entered Dartmouth College in 1847 and was graduated in 1851. He earned his early education by working on his father's farm during the summer, and by teaching school during the winter. After graduating, he taught in Craftsbury, and was principal of the academy at Chelsea, Vt. Meanwhile he studied law, and was admitted to the Orange County bar in 1856, practising until he was elected in 1870 as assistant judge of the Supreme Court. He was elected chief judge in 1890. Judge Ross was State attorney for Caledonia County 1862-3, represented Saint Johnsbury in the legislature 1865-7, and in 1869 was a member of the last council of censors held in the State. In 1870 he represented Caledonia County in the State Senate, was for several years a member of the State board of education, and early in 1899 was appointed by Gov. Smith to succeed Justin S. Morrill in the United States Senate.

**Ross, Sir William Charles**, English painter: b. London 3 June 1794; d. there 20 Jan. 1860. Entering the schools of the Royal Academy (1808) he carried off five silver medals, during his career as a student, and when he was but 15 (1809) exhibited at the Royal Academy 'Mordecai Rewarded'; 'The Judgment of Solomon'; and the portraits of a mother and child as 'Venus and Cupid.' In 1821 his 'Judgment

of Brutus' gained the gold medal of the Society of Arts. His most ambitious religious picture, 'Christ Casting out the Devils from the Maniacs in the Tomb,' exhibited at the Royal Academy (1825), was the last large canvas that he executed. Henceforth he devoted himself to miniature. He was elected R.A. in 1839 and became the most fashionable painter of his time in his chosen department. He painted Queen Victoria, Prince Albert, and their children, the King and Queen of the Belgians, and was summoned to Lisbon to paint the King and Queen of Portugal. Prince Louis Napoleon, (afterward Napoleon III.) sat for him, and he also painted every personage of his day in England distinguished for rank or genius. The total number of these exquisite works, as calculated from his own memoranda, was 2,200. He wisely attempted to give to the miniature that breadth of treatment which distinguished Reynolds, whom he evidently took for his model. His drawing was invariably correct, and marked by a nameless elegance enhanced by the truthfulness and clearness of his flesh tints and his clever handling of textures. His miniatures are still considered the models of their class in England. He was an enthusiast in his profession and on his death-bed almost his last words were expressions of regret that photography would destroy the art of painting in miniature.

**Rosbach, rôs'bâch**, or **Rosbach**, Prussia, a village of Saxony, in the government of Merseburg, 17 miles south of Halle, famous for the battle fought in its vicinity 5 Nov. 1747, when 22,000 Prussians under Frederick the Great defeated 43,000 French and Imperialist troops commanded by Soubise and the Prince of Saxe-Hildburghausen. The allies' loss was 1,700 killed and 7,000 taken prisoners, while the Prussian loss amounted to only about 500 killed.

**Rosse, rôs, William Parsons**, 30 EARL OF, British astronomer: b. York 17 June 1800; d. Monkstown, Ireland, 31 Oct. 1867. He was educated at Dublin University and at Magdalen College, Oxford, where he was graduated in 1822. He was member of Parliament for King's County from 1823 to 1834, and succeeded his father in the earldom in 1841. In 1845 he was elected a representative peer of Ireland, but took little interest in politics. During the stormy discussions on the first reform bill he was occupied with the construction of his first famous reflecting telescope, the speculum of which had a diameter of three feet, and was soon superseded by one of double the size. The two great defects which had hitherto baffled opticians in constructing large reflecting mirrors were spherical aberration and absorption of light by specula, and in the casting of those of large size there arose the apparent impossibility of preventing cracking and warping of the surface on cooling. Even the proper admixture of the metals for the reflector had to be ascertained by numerous and costly experiments. At last, however, a gigantic speculum, weighing three tons, was turned out without warp or flaw and was then polished and mounted on a telescope 52 feet in length in Lord Rosse's park at Parsonstown, at a cost of \$150,000. The sphere of celestial observation was immensely widened by an instrument so powerful; nebulae which had defied Herchel's telescope were resolved into stars, and new nebulous mist was revealed to the observation. The con-

struction of the telescope, effected under the earl's direction and superintendence, is fully described in the 'Philosophical Transactions' of the Royal Society, of which body he was president 1849-54.

**Roselli, rôs-sèl'lè**, Comino, Italian painter: b. Florence 1439; d. there 1507. He was a pupil of Neri di Bicci, the representative of the early Florentine school, and this school furnished the guiding principles of his artistic life, which was especially influenced also by the work of Benozzo Gozzoli. The altar-pieces and frescoes which he produced were filled with figures dressed in the costumes of his day, and the realistic minuteness of his faces seems to suggest that they were portraits of his contemporaries. He was in short a genuine Pre-Raphaelite of the Florentine school. His finest work is a fresco in the chapel of Sant Ambrogio at Florence: 'The Exhibition of a Miracle-working Chalice,' — a fashionable religious function of old Florence, displaying the silks, laces and jewelry of the time in all their splendor. Among other good works of his may be mentioned: 'The Coronation of the Virgin' and an 'Assumption,' both at Florence. He was called to Rome in 1480 by Sixtus IV. and contributed to the decoration of the Sistine Chapel, with the approval of the Pope who admired his lavish use of gold and ultramarine. Among his pupils the most celebrated were Pietro di Cosimo and Fra Bartolommeo (q.v.). He produced few easel pictures, but one of these, 'The Annunciation' (1486), was sold in 1847 for \$1,627 in England.

**Rosser, Thomas Lafayette**, American soldier and civil engineer: b. Campbell County, Va., 15 Oct. 1836; d. 29 March 1910. He entered West Point from Texas in 1856, but when President Lincoln ordered that class into the field after the attack upon Fort Sumter, Rosser resigned and entered the Confederate army, in which he was appointed 1st lieutenant of artillery and later captain. In 1862 he was made lieutenant-colonel and shortly afterward colonel of the 5th Virginia regiment under J. E. B. Stuart. In 1864 he became major-general in the army of Northern Virginia. He refused to surrender at Appomattox; escaped through the Federal lines, and while trying to reorganize scattered troops was captured and made a prisoner of war. After the war he studied law, but did not practice. In 1868 he became assistant-engineer in the construction of the Pittsburg and Connellsville Railroad; engaged on the Northern Pacific in 1870, becoming the next year chief engineer of its construction through Minnesota, Dakota and Montana; in 1881 became chief engineer of the Canadian Pacific railway. In 1886 he returned to Virginia to reside, and in the war with Spain in 1898 commanded a volunteer brigade.

**Rossetti, rôs-sèt'tè**, Christina Georgina, English poet, daughter of Gabriele Rossetti (q.v.): b. London 5 Dec. 1830; d. there 29 Dec. 1894. She was educated at home and her first verses were written in 1842 and printed in the private press of her grandfather, Gaetano Polidori. She was probably her brother Dante's first model and many portraits of her exist both as portraits and as figures in his paintings. A volume of her verse came from the Polidori press in 1847 and, later, after the establishment of 'The Germ' in 1850, she contributed to it.

under the name of "Ellen Alleyne." Of a deeply religious temperament, she was a devoted High Churchwoman and her writing, aside from devotional manuals and strictly religious works, was mainly poetry of a devotional character. 'Goblin Market,' however, published in 1862, is not of this type; and for original and purely imaginative qualities was never afterward approached by her. She also wrote 'The Prince's Progress' (1866); 'A Pageant' (1881); stories and nursery rhymes under the titles, 'Commonplace' (1870), and 'Sing Song' (1872); 'Verses' (1873), and such religious works as 'Annus Domini' (1874); 'Called to be Saints; the Minor Festivals' (1881); 'Time Flies: a Reading Diary' (1885); 'The Face of the Deep' (1892). From 1871 to her death she was for most of the time an invalid. Consult: Mackenzie Bell, 'Christina Rossetti: a biographical and critical study' (1898).

Rossetti, Dante Gabriel, English poet and painter: b. London, 12 May 1828; d. Berchington, 10 April 1882. His full name was Gabriel Charles Dante, but for literary purposes he rearranged it in the form by which he is now remembered. He was one of four children, all of whom, especially himself, his sister Christina and his brother William Michael, achieved fame in literature. His father, Gabriele Rossetti, professor of Italian in King's College, was an Italian exile, an enthusiastic patriot, himself a poet, and author of several critical works on Dante. He had married Frances Mary Lavinia Polidori, of English and Italian blood.

Dante Gabriel was educated at home, in an atmosphere of culture and fine enthusiasms; from his ninth to his fourteenth year he attended King's College. During that time he received some instruction in drawing, and upon leaving college he gave himself to the study of art, entering the Royal Academy in 1848. At the same time he began his translations from Dante and other Italian poets, showing from the first more genius in poetry than in painting. His great poem, perhaps his most remarkable, 'The Blessed Damozel,' was written about 1847. In 1848 he entered the studio of Ford Madox Brown, where he met Woolner, Holman Hunt, and Millais—the group that with himself and Madox Brown constituted the so-called pre-Raphaelite brotherhood. In 1850 William Michael Rossetti, edited *The Germ*, a short-lived but famous magazine devoted to pre-Raphaelite ideals; in its page appeared 'The Blessed Damozel' and other work of Dante Gabriel Rossetti's. Just what were the ideals of the pre-Raphaelites is hard to define; they stood in general for the devotional sincerity in art of those painters who preceded Raphael, and for freedom from modern academic canons; yet Rossetti himself was not strictly a pre-Raphaelite; his drawing was quite in his own style, little affected by the manner of the old painters.

For some time Rossetti had to face the proverbial artist's struggle; his pictures were not bought, and the peculiarities of his drawing were severely criticised. Ruskin's kindly defense of the pre-Raphaelites, however, encouraged the whole group. Shortly afterward Ruskin made Rossetti a standing offer to buy, up to a certain sum, all of Rossetti's painting that pleased

him. The arrangement lasted for some time, to Rossetti's great benefit. Through Ruskin he met Sir Edward Burne-Jones, who introduced him to Morris and Swinburne. Ruskin also generously assumed the cost of Rossetti's first volume, the 'Early Italian Poets,' a collection of translations which appeared in 1861. Rossetti afterward paid back the loan, and the book was reprinted in 1874 under the title of 'Dante and His Circle.'

In most of Rossetti's early pictures, his Beatrices and ideal ladies were copied after his wife, Elizabeth Eleanor Siddal, herself a poet and artist, whom he had married in 1860. Mrs. Rossetti was an invalid; the poet had no delusions as to the sadness shortly in store for him. But when, in 1862, his wife accidentally hastened her fate by an overdose of laudanum, Rossetti gave way impetuously to his grief, and in his impulsive despair buried in his wife's coffin the manuscript of his poems, for the most part inspired by her.

In the course of the next seven years—during which time he continued his painting with success, and also began the use of chloral—his friends persuaded him to recover his manuscripts, which he did in 1869. The following year appeared his 'Collected Poems,' containing the 'House of Life' sonnet sequence in its original complete form. In October 1871, Robert Buchanan, under the pen-name of 'Thomas Maitland,' wrote an essay entitled 'The Fleshly School of Poetry,' in the *Contemporary Review*. The purpose of this article was to show that Rossetti's poetry in thought and expression, was indecent; and to make his point the writer did not shrink from misquoting Rossetti or perverting his meaning. Rossetti made an adequate reply in an article called 'The Stealthy School of Criticism,' and in later editions somewhat unnecessarily withdrew the verses that had most offended Buchanan. But the injustice of the attack preyed upon him until his mind was deranged; at one time only the loving care of his friends prevented him from committing suicide.

He partly recovered his mental poise, and for a time entirely recovered his poetic and artistic faculties, which seemed at first not to be affected by his use of chloral. Several of his best pictures belong to this time; the 'Ballads and Sonnets' were published in 1881. These last years, however, were years of pitiful suffering and gradual collapse. His friends sheltered him from his worst moods and cared for him to the end.

In both painting and poetry Rossetti's personality expressed itself with unusual evenness throughout his career, and in 'The Blessed Damozel,' one of his earliest poems, almost all his qualities can be traced. Like so much of his other writing, it was illustrated, set to painting, as it were, by himself; but without such aid the pictorial genius is strong in the verse. The ideas are typically concrete; not only the Damozel, leaning on the bar of Heaven, is seen, with the lilies in her hand, and on earth the fall of autumn leaves, and in the sky the 'curled moon'; but from all points of view the appeal is to the eyes, as in that imaginative glimpse of the world spinning far below the bridge of Heaven; and in the picture of

souls ascending to God like thin flames—such as William Blake could have drawn; and in that "strong level flight" of the angels. The three lilies in the Damozel's hand and the seven stars in her hair, and the five handmaidens of the Virgin, are definitely numbered for the effect of concreteness; Rossetti habitually employs the device, as Keats employed it in the 'Belle Dame Sans Merci,' after the manner of the old English ballads—a manner that strongly influenced Rossetti. Partly from the ballads 'The Blessed Damozel' derived some of its mediæval flavor; but the quality was really personal with the poet. Here as in his other poems Rossetti manages to reproduce the romance of the archaic, without any great reproduction of the archaic itself. The furnishing of Heaven in the poem is quaint and remote, in effect like the lovely names of the five handmaidens; but the thought or attitude of no particular past time is revived. Perhaps some of this pseudo-archaic flavor comes from the strange verse-music, which Rossetti introduced into English. The secret of much of its charm is veiled in the poet's genius, but its most striking trait, its melancholy evenness, can be explained by Rossetti's training in Italian prosody. In writing English poetry he departs radically from the genius of English metre; instead of fitting the words with their natural accents undisturbed, into the regular beat of the verse—so placing them that the natural reading of the line would determine the rhythm—Rossetti allows a preconceived rhythm to determine the accent of the words, as in the line "With her five handmaidens, whose names," etc.

These characteristics of 'The Blessed Damozel,' and others besides, reappear more marked in other poems—the subtlety of thought, in 'Love's Nocturne'; the mediæval mood of devotion, altogether or almost religious, in 'Ave,' and in 'The Portrait,' with its splendid closing image; the ballad element, together with the unusual skill in reproducing physical sensation, in 'Eden Bower,' 'Troy Town,' and the longer ballads; and the same sad, even music in them all. Among his other verse the elaborate ballads—'Rose Mary,' 'The White Ship,' 'The King's Tragedy,' show Rossetti's debt to ballad literature, and at the same time mark the wide gulf between the clear simplicity of the old narratives and the wrought loveliness of his work. In his shorter ballads, however, such as 'Stratton Water,' he is much simpler. What hold he had on real life is powerfully concentrated in 'Jenny,' probably his most thoughtful poem.

Rossetti's sonnet sequence, 'The House of Life,' undoubtedly places him among the masters of the sonnet form, though none of the sonnets, perhaps, are so well known as 'The Blessed Damozel.' Technically, they have more of the rise and fall of the best Italian models than is usual in English poetry, and at times, as in the first sonnet, or the twenty-fourth or the twenty-fifth, their cadence is superb. But in many of them the mystical subject-matter is baffling, and Rossetti's characteristic evenness of manner, here also an evenness of mood, makes the sequence monotonous at last. Perhaps Rossetti's best sonnets were written singly for pictures—as the beautiful 'Lilith' and the 'Venus Verticordia,' with the three wonderful lines at the end.

The most widely known of Rossetti's trans-

lations are the three from Villon, especially the 'Ballad of Dead Ladies,' and Dante's 'Vita Nuova.' In all of his translated verse, however, the same traits are found as in his original work—the same exquisite, rather than great mood, the same concrete, yet remote, aspects of beauty, and the same un-English music of the verse. He has many imitators in both his arts.

**Bibliography.**—The best edition is by W. M. Rossetti. For biography and criticism, consult Introduction to the above; 'Dante Gabriel Rossetti; His Family Letters,' with memoir by W. M. Rossetti; Hall Caine, 'Recollections of Dante Gabriel Rossetti'; Walter Pater, in 'Appreciation'; the same essay in Ward's 'English Poets.'

JOHN ESKIN,  
Associate Professor of English in Amherst College.

**Rossetti, Gabriele, Italian poet:** b. Vasto, Abruzzo Citeriore, 28 Feb. 1783; d. London, England, 26 April 1834. He was educated at the University of Naples and in 1814 was appointed curator in the Museum, there. He joined the Liberals and in 1815 became a member of the secret society of the Carbonari. He was a supporter of the constitution which King Ferdinand was forced to grant as the result of a military uprising, and when in 1821 the constitution was abrogated and its adherents proscribed Rossetti was compelled to fly the country. He went first to Malta and in 1824 to London where he was engaged as a teacher of languages and was elected professor of Italian at King's College, London, in 1831. In his political opinions he continued an ardent Liberal, but was in favor rather of a constitutional monarchy than a republic. In religion, though never wholly abjuring the Roman Catholic creed, he was for many years practically a freethinker, though in later years he accepted an undogmatic form of Christianity. In 1845 blindness compelled his resignation from the college. His works include: 'Dante, Commedia' (1826); 'Lo Spirito Anepapale che profetizza la Riforma' (1829); 'Poems' (1831); 'Il Mistero dell' Amor Platonico del Medio Evo' (5 vols., 1840); 'La Beatrice Dante' (1842); 'Il Vagante in Solitudine' (1846); 'L'Arpa Evangelica' (1850); etc.

**Rossetti, Maria Francesca, English author,** daughter of Gabrielle Rossetti (q.v.): b. London, England, 17 Feb. 1827; d. there 24 Nov. 1876. She engaged in teaching and in literary work, the latter being chiefly of an educational or religious character, and in 1874 entered the sisterhood All Saints' Home, London, where she died. Her works include: 'Exercises in Idiomatic Italian' (1867); 'A Shadow of Dante' (1871); 'Letters to My Bible Class' (1872); etc.

**Rossetti, William Michael, English poet and art critic,** son of Gabrielle Rossetti (q.v.): b. London 25 Sept. 1860. He was educated at King's College, London, and entered the excise office in 1845. From 1860-94 he was assistant secretary to the board of inland revenue, and is at present professional assistant to the same board for estate duty on pictures and drawings. He has published: Blank verse translations of Dante's comedy 'The Hell' (1865); 'Lives of

Famous Poets' (1878); 'Life of Keats' (1887); 'Mémorial de Dante G. Rossetti' (1895); 'Gabriele Rossetti' (translated autobiography 1901); etc., besides much editorial work, including the works of many poets and the 'Rossetti Papers' (1862-70-1903).

Rossi, Francesco de, frân-chês'kô dâ rôs'sê, known as Il Cecco di Salviati, Italian painter: b. Florence about 1510; d. Rome 1563. He was a pupil of Michelangelo and Parmigiano and a painter of history and mythological subjects. Little is known of his life, excepting that he went to France, made enemies by his eccentric conduct and reckless wit, and found little patronage there. He is said by Vasari to have decorated many Italian palaces and there are examples of his work in several of the great European collections, including his 'Charity' in the English National Gallery; and his 'Holy Family' in the Prado Gallery, which show him to be somewhat mannered in execution, but none the less a painter of the Florentine school at its best.

Rossi, Giovanni Battista de', jô-vân'pê băt-tês'tâ dâ, Italian archaeologist: b. Rome 23 Feb. 1822; d. there 20 Sept. 1894. He was distinguished for his studies of the inscriptions of the early centuries of the church, and made important discoveries in the catacombs. He was made a member of the Berlin Academy of Sciences and corresponding member of the French Institute. He published: 'Inscriptiones Christianæ Urbis Romæ septimo Sæculo Antiquiores' (1861); 'Roma Sotteranea Christiana' (1864-77).

Rossini, Gioachino Antonio, jô-â-kê'mô ân-tô'nê-ô rôs-sê'nê, Italian composer: b. Pesaro 29 Feb. 1792; d. Passy, near Paris, 13 Nov. 1868. He was born of poor parents, and when only 10 was able to support his mother by singing solos in church. He also took the part of Adolfo in Paer's 'Carnillo' at the theatre of the Commune—his only appearance as a dramatic singer. He began his musical studies with his parents, but later he studied composition and counterpoint under Tesei and Mattei, both of Bologna. His first opera, 'Demetrio e Polibio,' was composed before his studies under the latter, and even at that stage of his career he had mastered the art of imbuing his music with feeling. His first public appearance as a dramatic composer was at Vienna in 1810, when his opera 'La Cambiale di Matrimonio,' was performed. Successful though it was, it did not contain any definite evidence of power to assert a new school or create a radical change in style. It had been preceded in 1808 by 'Il Pianto d'Armonia per la Morte d'Orfeo,' a cantata, which gained the prize at the Liceo and was performed in public on 8 August of that year. His next composition was 'Didone abbandonata,' a cantata, followed by an opera buffa, 'L'Equivoco stravagante,' which brought him fresh triumphs. Early in 1812 he produced two buffa operas, 'L'Inganno felice' and 'L'occasione fa il Ladro,' ossia il Cambio della valigia, each of which contained several songs full of force and original melody. He attempted one oratorio, 'Ciro in Babilonia,' which unhappily proved a failure. In the autumn of 1812 he wrote a musical two-act comedy 'La Pietra del Paragone,' produced at the Scala with immense success. In the finale occurs the first instance of his employment of

the *crescendo*, for which he became famous later, and which Mosca declared had been borrowed from his own 'Pretendenti delusi.' In 1813 Rossini composed 'Tancredi,' an opera based on Voltaire's drama, full of good situations and patriotic sentiment. Its choruses are rich in martial passages. 'Di tanti palpiti' became popular everywhere, and made Rossini the most famous composer living. During that year he also wrote 'L'Italiana in Algeri,' containing the charming trio 'Papataci' and the patriotic air 'Pensà alla Patria.' During the next two years Rossini wrote eight operas, including the well-known 'Barbiere di Siviglia' and 'Otello,' while in 1817 he produced his celebrated operas 'La Cenerentola,' 'La Gazza ladra' and 'Armida,' but critics still regarded him as a 'mere musical figure-maker and a diluter of melody into mere ornament.' 'Ermione,' his next opera, has been styled a 'system of word-painting.' His next notable compositions were 'Adelaide di Borgogna' (or 'Ottone Rè d'Italia,' as it is sometimes called), and another oratorio, 'Mosè in Egitto.' The former was produced during the Carnival of 1818 and was warmly received, and the latter at the San Carlo in Naples. During the summer of 1818 he wrote 'Adina, o il Califfo di Bagdad' for the San Carlo theatre in Lisbon, and 'Ricciardo e Zoraide' for the San Carlo in Naples, an opera full of ornament. His 'La Donna del Lago' seemed to show that Scott's works were becoming popular even in Italy. In this opera and others that followed, such as 'Maometto,' 'Zelmira,' 'Semiramide,' etc., it was plain that Rossini was half a century ahead of his day. His style was changing; his gaiety had disappeared; he was becoming serious. He now visited England, on the invitation of the manager of the King's theatre in London, to write an opera for that house, to be called 'La Figlia dell' Aria,' for which he was to receive about \$1,200. He arrived in London in December 1823, with his wife, Isabella Colbran, a singer, to whom he had been married about two years, and while there was much lionized. He acted as accompanist at numerous soirées, gave several concerts, singing the solos on two occasions in a cantata which he had composed for the occasion under the title 'Homage to Lord Byron,' and in five months had acquired nearly \$35,000. He then undertook the musical direction of the Théâtre Italien in Paris for 18 months at a salary of about \$4,000 a year. He here reproduced some of his operas, for example, 'La Donna del Lago,' 'Semiramide,' 'Zelmira,' etc., and also brought out a new one—'Il Viaggio a Reims, ossia l'Albergo del Giglio d'Oro'—composed for the coronation fêtes of Charles X. The sinecure positions of 'Premier Compositeur du Roi' and 'Inspecteur Général du Chant en France,' were now given him, with an annual income of 20,000 francs, or about \$4,000. He then revised the music of 'Maometto,' brought out under the title 'La Siège de Corinthe,' and also reproduced 'Mosè,' with many improvements and additions, some of the interpolated airs being taken from 'Armida' and 'Ciro in Babilonia.' He next resolved to try his skill at lyric opera, and adapted to the 'Le Comte Ory' some of his favorite music in the 'Il Viaggio a Reims,' but it is said that the best part of the drinking chorus was borrowed from Beethoven's 8th Symphony. His next opera, commonly re-

garded as his masterpiece, was 'Guillaume Tell,' which was produced at the Académie on 3 Aug. 1829.

With its completion the prolific career of the composer may be said to have ended, for though he lived nearly 40 years longer, a few songs, his 'Stabat Mater' and the 'Petite Messe Solennelle' are about all he wrote. These 40 years were spent at Bologna and at Passy, where he died.

Determining to revisit Bologna, where his mother had died in 1827 and where his father was still living, he resigned his post, but made an agreement with the government to compose operas for the French stage for the next ten years, and to produce one every two years, receiving 15,000 francs for each. Should this plan not be carried out, he was to receive a pension of 6,000 francs. On account of the abdication of the king of France and the revolution of 1830, he returned in November 1830 to Paris. The new government, however, was not willing to recognize the agreement above mentioned, and for several years he fought his case in the courts, it being eventually decided in his favor. During this time he wrote his 'Stabat Mater.' In 1830 he again left Paris for Bologna, where his father died in 1839. He now wrote a number of songs and choruses, among which may be cited 'Inno popolare,' for the accession of Pius IX. His wife died in October 1845, and two years later he married Olympe Pelissier, whom he had met in Paris. In 1855 he again returned to Paris. His 'Petite Messe Solennelle' was produced on 14 March 1864, and he afterward scored it for a full orchestra, in which form it was given at the Théâtre Italien on 28 Feb. 1869, three months after his death. "Next to the Emperor," writes one of his biographers, "he became the first man in this city of arts and artists."

Rossini's position among the world's greatest composers has been much discussed. His joyous disposition and light-heartedness have been used as arguments against classing him with such profound composers as Mozart and Beethoven, the latter of whom is recorded as having characterized Rossini's work as "degrading the art in general wantonness with a negligence bordering on frivolity." It has been often said that Rossini's melodies are conspicuous for great sweetness and wonderful sensuous attraction, as for instance in the first finale of 'Cenerentola,' or as evidenced by the jolly roguery of the 'Barber of Seville.' This is unquestionably true, and these are the fruits of his special form of genius. They are his natural endowment, and probably if he had at that time tried ever so hard to write in a different vein, he would have failed. His melodies were intended to please the public, for whom he wrote, and they fulfilled their mission to perfection. That he accomplished much for music cannot be gainsaid, and especially for operatic music in Italy.

Rossini devoted his talents very largely to composing operas, and the list of his works contains the titles of between 50 and 60, including a few which he recast. It should be remembered that with few exceptions he, an Italian, wrote for Italians, and therefore gave them that for which they craved. If he overstepped their limitations, they were dissatisfied; as for instance in 'Otello,' where he was actually compelled to modify the tragic termina-

tion in order to save it from being banished from the Italian stage. The Italians wanted nothing very romantic or sentimental, but as long as Rossini filled his operas with buffoonery and comical situations, they met with unqualified success. All this was changed in 'Guillaume Tell,' the music of which manifests a mind filled with deep emotions and a profound appreciation of the romantic. It is as though he had suddenly determined to disarm his critics by proving himself capable of rising to great heights when the occasion demanded. This work has been well described as a great tone-painting of Switzerland, a kind of pastoral symphony in opera form to which the fable of William Tell is only an accessory. The basic characteristics of his previous operas are absent here, and as though transformed by magical power, he suddenly appears no longer as the buoyant artist of old, but as one in whom had been created an innate love of the true and the beautiful. The sensuous gave place to a grand conception of all that was worthy in musical art.

Notwithstanding the immense popularity of Rossini's compositions, there have been pointed out certain peculiar features repeated over and over again which have caused some of his critics to temper their praise. Nor were these peculiarities entirely of Rossini's own creation, some of them having been borrowed from the works of Generali, Velluti, and others. Prominent among them is the use of the crescendo, "which," says one, "appears as regularly and invariably in his overtures and finales as horse-radish with a joint of roast beef." The constant use of triplets is another mannerism which has provoked adverse criticism, while the undue prominence of appoggiaturas (leaning notes), in many cases of longer duration than the harmonic notes to which they are attached, has also been condemned, as well as his practice of closing his periods by modulating them from the major tonic to the minor mood of the lesser third below, or of the great third above the major tonic. A more serious charge made against him was that of plagiarism, it being stated that besides resorting to the national airs of Italy, he availed himself to a great extent of the ideas of Generali, Cimarosa and other Italian composers, as well as of several German composers, such as Haydn, Mozart, Krommer, etc. Thus, while no competent critic has denied that Rossini possessed genius of an extraordinary character, many are inclined to believe that his inventive faculties were confined within quite measured limits.

In spite of all this, there can be no doubt that his compositions form a memorable epoch in the history of musical art. It was he, moreover, who substituted singing for the endless recitatives which had been in vogue, and he also gave the bass voice a leading part, insisting, too, that a singer should sing the notes of the composer without any additions of his own. He also made the chorus an important feature, and fortified the orchestra by adding wind instruments to the strings, which alone had hitherto been used.

It cannot be questioned that wherever his operas appeared, they became firmly established and in many instances almost banished the classic works of the greatest masters who had preceded him. Thus, in Italy, they nearly sup-

## ROSSITER—ROSTOV

planted the works of Pasiello, Mayer and others, including even Cimarosa. In Germany the national predilection was for graver music, but even there Rossini was, as one of his biographers puts it, "lord of the ascendant." While he rarely, if ever, reached the tragic grandeur of Gluck, or the intense feeling of Mozart and Weber, his music is never dolorous and heavy, as is the case with some of the best compositions of the German school. Forceful and precise rhythm is another of his principal characteristics, while his scores are notable for their simplicity of outline and primary conception, although his manner of decorating the framework was at times intensely florid. Consult biographies by Beyle-Stendhal (1823, new ed 1892); Azvedo (1865); Edwards (1869); Zanolini (1875).

**Rossiter**, rôs't-ér, Thomas Pritchard, American artist: b. New Haven, Conn., 29 Sept. 1817; d. Cold Spring, N. Y., 17 May 1871. He early developed a talent for art and secured Jocelyn of New Haven as his instructor. He studied in Rome 1840-6, and on his return opened a studio in New York, where he was elected a National Academician in 1849. He painted historical and religious subjects, and was an admirable colorist.

**Roseland**, rôs'land, Canada, an incorporated city since 1897, in the West Kootenay District, British Columbia, on the Canadian Pacific and Spokane Falls and Northern railways, near the international boundary-line. It is the receiving and distributing centre for one of the richest gold-mining districts of British Columbia. Silver and copper are also found; and great smelters and reducing works have been erected here and at Trail, about 10 miles distant. The town is well built, and has schools, churches, wholesale and retail stores, banks, and daily and weekly newspapers. Pop. about 7,000.

**Rostand**, rôs-tân, Edmond, French poet and dramatist: b. Marseilles 1 April 1869. He obtained his education at the Marseilles Lycée and the Collège Stanislas of Paris, and in 1891 was admitted to the practice of law. His first book, 'Les Musardises' (1890), a collection of verse, attracted scant notice; nor was 'Pour la Grèce' (1897), a poem which he recited for the benefit of wounded Greeks and Cretans in the Græco-Turkish war, much more successful. As a playwright, however, he at once met favor. His 'Les Romanesques' (1894), and 'Princesse Lointaine' (1895), both in verse, were applauded by public and press. But they were quite outdone by his 'Cyrano de Bergerac' (1897), a five-act drama in verse, which proved to be one of the most conspicuous successes of the modern stage, being presented in Paris 500 times consecutively, with Coquelin in the title-role. It was given also in the United States in English by Richard Mansfield and in French by Coquelin. It employs the historic figure of de Bergerac (q.v.), duelist and author. 'L'Aiglon' (1900), based on the story of the King of Rome, was given in the United States by Sarah Bernhardt, who created the part in Paris, and, in English, by Maude Adams. Rostand was elected to the French Academy 30 May 1901, the youngest "immortal" ever admitted. His versification is finished and brilliant, his wit keen and polished; and added to these, his work displays a certain enthusiasm and spontaneity. He contributed,

with Stephen Phillips (q.v.), to the much talked of renaissance of the poetic drama. Among English translations are 'Cyrano' by Thomas and Guilenard (1898) and Hall (1898); 'L'Aiglon' by Parker (1900); 'Les Romanesques' by Fleming ('The Fantasticks' 1900) and Hendee ('The Romancers,' 1899).

**Rostock**, rôs'tôk, Germany, in the grand duchy of Mecklenburg-Schwerin, on the left bank of the Warnow, 80 miles northeast of Lübeck, is one of the most important cities on the Baltic. It consists of three parts: The Old, the New, and the Middle Town. The east or old town bears the impress of an old Hanse town; the Middle Town is the most modern and best-built. The most noteworthy points of interest are: the palace of the grand duke; the town-house, with its seven towers; the church of Saint Mary (1400) and other parochial churches; the university (1419), attended by about 500 students; the house in which Blücher was born, and the one in which Grotius died; schools, hospitals, etc. The fine promenades surrounding the city were formed on the site of the old fortifications. There is an extensive trade in agricultural products and salt, and important fisheries.

**Rostopchin**, rôs-tôp'chîn, or **Rostopchin**, Feodor Vassilievich, Count, Russian general: b. Province of Orel, 23 March 1763; d. Moscow 12 Feb. 1826. He entered the Imperial Guards as lieutenant, was highly promoted under Paul I., but afterward dismissed in disgrace. Under Alexander he became governor of Moscow, and exercised an important influence over the campaign of 1812, even if the assertion of the French that the burning of the city was his work should be untrue. He himself denied this charge in his 'Vérité sur l'Incendie de Moscou' (1824). It is certain, however, that he caused his villa near Moscow to be burned, and took measures for the destruction of the magazines in that city. In 1814 he accompanied the Emperor Alexander to the Congress at Vienna. He afterward traveled, and spent several years in literary pursuits in Paris. His works include a number of historical memoirs, comedies, etc., written in French and Russian, and published in 1853. Consult Schnitzler, 'Rostopchine et Koutousoff' (1863); Segur, 'Vie de Comte Rostopchine' (1872).

**Rostov**, rôs'tôf, or **Rostoff**, Russia, in the government of Ekaterinoslav, picturesquely situated on a prominent summit above the Don, 20 miles from its mouth in the Sea of Azov. It is the oldest town of eastern Russia, a centre of considerable traffic, and some domestic industries, and its annual fair establishes the prices of cotton goods preliminary to the great fair of Nijni-Novgorod. The chief objects of trade are grain, flour, tobacco, drugs, herbs, saddlery, linen manufactures, and enameled sacred pictures. It has ever counted as an important point, from the period when first contended for by Slavs and Finns. After the Mongolian invasion it declined, and was successively plundered by Tartars, Lithuanians and Poles. Electric lighting, street railroads, and telephones are among its modern features. The ancient cathedral (1216) contains precious sacred relics of Christian missionaries and princes. Pop. about 125,000.

## ROSTRA—ROTARY STEAM ENGINE

**Ros'tra**, a name given the platform or stage in the forum in Rome, whence the orators used to harangue the people, so called from the beaks (*rostra*) of the ships taken, in 338 B.C., from the Antiates, with which it was adorned. It was a circular structure raised on arches, with a stand on the top, bordered by a parapet, the access to it being by two flights of steps.

**Roswitha**, *rōs'vê-tā*, or **Hrotswitha**, *hrōts'vê-tā*, German poet: b. about 932; d. about 1002. She was of Saxon birth and a nun in the Benedictine convent of Gandersheim, Brunswick; the first German poet and the first dramatist since the Roman period. She wrote sacred legends, a poetical chronicle of the reign of Otto I., and six Latin comedies for performance before the sisterhood. The latter were imitations of Terrence, and without attempting a development of character they displayed rapidity of action and good theatric effect. Her works were first published at Nuremberg in 1501; translations were made by Benedixen in 1850-3. The best edition was published by Barack in 1858. Consult Köpke, 'Hrotsuit von Gandersheim' (1869).

**Rosy Finch**, one of the large finches of the genus *Leucosticte*, several species of which inhabit the higher parts of the Rocky Mountains and the colder parts of northwestern America, coming southward in winter. Their plumage is suffused with rose-red, brightest in the males, and in the spring they have a loud and pleasant song. The best known species is *L. tephrocotis*, common in Colorado and Utah in winter. Consult Coues, 'Birds of the Northwest' (1874).

**Rot**, a disease in sheep and other gram-inivorous animals, produced by the hydatids *Fasciola hepatica* and *Distoma lanceolatum*, often living in great numbers in the gall-ducts and bladder of the animal. (See SHEEP.) Also the popular name for many fungoid diseases of plants. See DISEASES OF PLANTS; FUNGI.

**Rota Romana**, *rō'tā rō-mā'nā*, or **Ruota Romana**, signifies an ecclesiastical tribune of the Roman Catholic Church situated at the papal court; from this situation probably comes the name of the tribunal, since the old papal courts were decorated with mosaics in the shape of wheels or *rota*. The Rota Romana was at one time a body of vast judicial power, having jurisdiction not only over all cases of appeal and all disputes of beneficiary and patrimonial nature, but as well over the more important class of all cases concerning ecclesiastical benefices. These last are no longer within the jurisdiction of the court, its power being diminished of necessity by the political position of the papacy of to-day. But over the first two classes named the court has full jurisdiction, its decree being final, inasmuch as the only appeal permitted is one directly to the Pope.

The Rota Romana was, and still is, a collegiate body, although its constitution has undergone radical changes in recent years. Originally it was composed of 12 prelates, mostly Italians, but representing also the other papal states of Catholic Christendom. The meetings which took place in the palace of the Pope twice a week were of supreme importance in the administration of the Roman Catholic Church law throughout the world. The tribuna is now divided into two colleges or senates.

**Rotary Steam Engine**, a type of engines in which the pistons rotate within the cylinder, or the cylinder upon the pistons, thus giving a continuous rotary motion and eliminating the loss of power consequent to the necessary change in the direction of motion of a piston working horizontally in a cylinder, as in the case of an engine operating with a reciprocating action.

The varieties of rotary engines are numerous, consisting of machines equipped with one, two, three, and four pistons on single axes, or of pistons working in pairs on several axes, operated by steam injected against them, or working by the reactive action of steam emitted tangentially. The basic principle was suggested by the inventors of the last century, among whom Watt, Cartwright, and Galloway may be included; while among the notable engines of this class may be mentioned the Scheutz (Swedish), the Thompson (Scotch), the Behrens (American), and the Pillens and Hill (English), in all of which the pistons revolve within the cylinder, and differ from each other only in the details of the mechanical arrangements employed to utilize the pressure of the steam.

In another form perfected by Harris, portions of the engine are attached to two hubs and run in different directions. The hollow trunnions of one axis carries the two radial arms which emit steam at their ends tangentially against vanes carried on the other axis with a direct driving action. By gearing the two motions are utilized upon a single shaft. The latest development, and perhaps the most efficient, is that perfected by William M. Hoffman, of the type in which the cylinder revolves around the pistons upon an elliptical steam-chest supported by a hollow shaft through which the steam is admitted and exhausted.

Fig. 1 shows a side view of the engine in which A is the revolving cylinder; B, steam entrance to hollow shaft; C, shaft and ellipse support; D, bearings of revolving cylinder; E, steam exhaust from hollow shaft, and F, power connection for gearing or belting.

Standard for holding stationary shaft and core.

Fig. 2 shows a cross section of the cylinder A; the ellipse E, supported by sleeves upon the hollow shaft S; and two segmental blade pistons B and C, which extend the entire length of the cylinder to which they are attached by the cranks G.

By construction the expansion chamber L is formed of three sides—the inner surface of the cylinder, and the outer surface of the ellipse,

## ROTATION—ROTATION OF CROPS

both of which are rigid, and the convex surface of the piston B, which is free to move into and out of its housing D.

In operation, the steam is admitted at one end of the hollow shaft S, and exhausted at the

the length of its day. So with the other planets. The sun also rotates as is shown by the movement of spots across its disk (see SUN). The earth's rotation slightly increases the force of gravity in moving from the equator to the poles. Sir William Thomson, reasoning from some small anomalies in the moon's motion, inferred that 10,000,000 years ago the earth rotated one seventh faster than it does now, and that the centrifugal force then was to that now as 64 to 49; (b) in botany, the movement of the protoplasm observed in the cells or cell-walls of certain plants. Little or nothing is definitely known as to the causes that bring it about, but it is probably related to the similar motion in amoeba and other low orders of animal life; (c) in mechanics. See MECHANICS.

**Rotation of Crops**, the order in which crops are grown during a series of years on the same land. The advantages of this practice are: (1) All plants tend to exhaust the soil, but in different degrees, hence a rotation tends to maintain a balance. Thus at the Rothamsted Experiment Station, England, where wheat has been grown on the same land for 62 successive years without manure or fertilizers, the average yield is about 13 bushels per acre, or nearly the same as the average yield in the United States, while where grown in a four-course rotation of rutabagas, barley, beans or clover, wheat, the average yield during a period of 52 years is nearly 27 bushels per acre, without manuring or fertilizing. (2) All plants do not take up the same ingredients in the same proportion; thus, crops rich in carbonaceous matter take up relatively small amounts of food from the soil, but large quantities from the air, the latter costing nothing. (3) Some crops give better opportunity for cleaning land, as corn, potatoes. Others cannot be tilled and favor the growth of weeds, as wheat, oats. (4) When several crops are grown on a farm the labor is distributed over a greater portion of the year and it is more economical. The social evils consequent on temporary employment at high wages for a short period of the year, and idleness the rest of the time, cannot be overlooked. (5) Plants vary in their ability to assimilate the plant food in the soil; thus buckwheat and rye are able to flourish where wheat and cabbages could hardly live. (6) The legumes enrich the soil in nitrogen. (7) A variety of crops is essential where cattle and other live stock are kept. (8) In a rotation the increase of destructive insects and diseases is hindered, owing to their not having the necessary crop to prey upon. (9) Some crops permit the sowing of others among them, thus saving time; clover and grass seeds being sown among barley and wheat, wheat sown among corn. (10) Some crops permit the aggregation of the soil particles when they become excessively reduced by tillage, hence land is laid down to grass, alfalfa. (11) Certain crops aid in accumulating humus, as grass, hence such should follow two or three years of exhaustion by tillage. Admitting air to the soil tends to destroy humus and to reduce the water-holding capacity. The loss of humus has converted garden-spots in New York and other Eastern States, northern Africa, Asia Minor, and Spain into wastes, and Sicily, the granary of Italy in the time of the Romans, is now comparatively sterile.

FIG. 2.

other after having been utilized by the action of an automatic cut-off arrangement which allows it to enter the chamber L, through the port F, where it expands and pressing against the piston B, moves it forward over the ellipse, thus causing the cylinder to revolve. As the piston B approaches the greater dimension of the ellipse, it is forced into its housing D, where it forms an abutment against the escape of steam; while the piston C, arrives opposite the port F, exhausts the steam, and relieved of the pressure of the greater dimension of the ellipse emerges from its housing H, and forms the free side of a new chamber L, into which the steam is again admitted by the automatic cut-off to expand and continue the action already described.

Rotary engines are designed to obtain the greatest possible efficiency with the least amount of fuel consumption, and a great reduction in engine-room floor space. Engines capable of developing 300 horse-power, at 2,000 revolutions per minute have been successfully and economically operated.

W. MOREY, JR., C.E.,  
Consulting Engineer.

**Rotation**, (a) in astronomy, the turning round of a planet on its imaginary axis, like that of a wheel on its axle. The rotation of the earth is performed with a uniform motion from west to east, and occupies the interval in time which would elapse between the departure of a star from a certain point in the sky and its return to the same point. The only motions which interfere with its regularity are the precession of the equinoxes and nutation. The time taken for the rotation of the earth measures

## ROTATION OF CROPS

Rotations are described according to the number of years required to complete a circuit, as three-course, four-course, etc. In the latter the tillable land is divided into four parts and each crop is grown on part of the farm each year. The folly of growing the same crop on the same land for several successive years was noted by the Romans and others, as also the benefits derived from growing a leguminous crop, as alfalfa or clover, previous to a grain crop, as wheat. These observations remained unutilized until a comparatively recent date. Rotations have gradually grown into their present forms according to circumstances, and have been and are modified as required and as our knowledge increases. Attention was first drawn to their value in 1777, in a treatise by Dickson of Edinburgh, Scotland.

One of the earliest recorded systems was the "outfield" and "infield," in which part of the land was used for growing grain until its crop-producing power was so reduced that it became unprofitable, when it was allowed to lie idle for a number of years. Increase of population caused a modification, the land being rested or "fallowed" a year at intervals; thus, among the Jews, this was repeated every seventh year. A system of continuous single-cropping has been pursued in the Western States with distinct loss to the nation. Where land is weedy and in dry districts, as parts of California, the east of England, etc., bare fallowing or the cultivation of the soil without growing a crop is still considered good practice, sufficient moisture being conserved to ensure a profitable crop the succeeding year. A development from this system consisted of the introduction of green crops, either intertillage crops, as corn, turnips, potatoes, cabbages, etc., if the land was weedy and needed cleaning, or of legumes, as clover. The advantages of a crop-fallow are that the land is turned to profitable use, it is cleaned and the available nitrogen present as nitrates, is not so liable to be lost by percolation, being taken up by the crops; that humus is produced from the root-residue; and that if a leguminous crop is grown it enriches the soil in nitrogen by means of the bacteria on its roots.

In 1788 Marshall of England stated that a common rotation was: 1st year, wheat, barley, or bigg; 2d year, oats, beans and pulse; 3d year, bare fallow. A distinct advance was made with the realization of the value of the Norfolk four-course, which was practised on light land and originally consisted of roots, barley, clover, wheat. The principles involved are: (1) that a deep-rooted crop shall succeed a shallow-rooted one, barley being shallow-rooted and clover deep-rooted; (2) that crops of the same natural order and somewhat like tendencies, as wheat and barley, both being straw-crops and more or less subject to similar enemies, shall not succeed each other; (3) that a weedy crop shall be followed by a cleaning one, as the roots after the wheat; and (4) that a leguminous crop shall have a place in each rotation. The advantages of this system were: (1) The wheat was grown after a nitrogen-gathering crop; the clover stubble was readily prepared for wheat in the fall, or if stock feed was scarce it could be pastured late and spring wheat or oats grown instead. The wheat was harvested in time to permit the land being fall-plowed and cleaned for

the succeeding root crop. (2) The fallow crop, roots, received manure and intertillage, and gave an opportunity to clean the land and stir it deeply. It furnished work for the horses in summer in cultivating, and a bulky crop of succulent feed for stock, which with the hay furnished considerable manure. (3) A grain-crop follows well after a root crop, and generally little or no plowing is needed. Barley is a good crop to seed with, as it occupies the land but a short time and is not so exacting on the soil moisture as oats. (4) The clover requires a firm seed-bed, and if the roots were consumed on the land and shallow tillage given in fitting the land for the barley such was secured. The barley permitted a good growth of clover which enabled it to withstand the winter. This crop supplied the hay. The disadvantages of this system are that it is too short, the land being liable to become both clover and turnip sick, and the turnips affected with "club-root." Under these circumstances clover and turnips could be taken every eighth year, substituting beans, peas or cowpeas for the former, and potatoes, etc., for the latter. Such close cropping renders the rotation expensive, the labor bill being high, but the cost may be reduced by leaving the grass and clover seeding down for two or three years, thus making a five or six years' rotation, or it may be used as the basis for a 7 or 8 course. This rotation is capable of adaptations as follows: (1) Grain—wheat, oats, barley, rye, corn, buckwheat; (2) Cleaning or fallow crop—corn, potatoes, sugar beets, mangels, tobacco, cabbages, turnips, rutabagas, rape, cowpeas, soy beans, sorghum, etc.; (3) Grain—barley, oats, rye, wheat, corn; (4) Legume—clover, grass and clover, cowpeas, soy beans; (5) Legume—grass and clover, mown once and pastured, or pastured all the year.

In the United States the rotations of crops vary considerably in different sections. In many places the succession of crops is dictated rather by accident or convenience than by any well considered principles. Corn and wheat or oats formed a common two-course rotation with the early settlers, until the land failed to produce a crop of wheat when corn was grown every second year, the land going to weeds in the interval. The "Eastern Shore rotation," which is a two-course, consists of corn followed by oats, with a secondary crop of Magothy Bay beans. The growth of this leguminous crop, while curtailing the yield of oats, furnishes considerable green manure for plowing in. The first system on the best cultivated farms in Virginia was a three-course, beginning with corn, and succeeded by wheat, in which the grass and weeds were allowed to grow and be grazed the third year. One well known farmer in Virginia grew clover in place of the weeds the third year to furnish green manure. A later rotation was: (1) corn or oats; (2) wheat and clover sown; (3) clover grown and plowed under in August and the land seeded to wheat for the fourth year.

An old and successful rotation recorded for New England is corn, oats, and timothy and clover, the latter remaining down for three years, thus two plowings are required in five years, one for corn, and a light plowing for oats, the grass and clover seed being sown among the oats. A modern three-course rotation for the Eastern States is potatoes,

## ROTCH—ROTHSCHILD

winter rye, clover. This is a modification of a well-known Middle Western rotation, potatoes, winter wheat, clover. It embraces a root crop, a cereal and a leguminous crop. It is well suited to light and medium soils and is economical in labor, but one deep plowing being required in three years, that for the potatoes, the land being prepared for the rye by disking. The potatoes are a cash crop, the rye furnishes bedding and feed for stock, and the clover furnishes hay, and is not left down long enough to be seriously injured by the clover-root worm. The rotation is too short for many places, and probably the land would become clover-sick. It may be converted into a four-course by growing a crop of corn after the clover, and into a five-course by sowing grass with the clover and leaving them down for two years, thus corn, potatoes, rye, grass (timothy, redtop, etc., clover), mown, grass mown and grazed. In this way two fifths of the tilled land is plowed each year, that for corn and potatoes; the land for potatoes may be plowed in fall after the rye is sown in September, thus reducing the spring work. If milch cows are kept, the corn furnishes grain and stover or may be cut for silage, the rye may be cut green for fodder or allowed to mature, and the area in potatoes might be reduced and cowpeas, soy beans, peas and barley, or some other fodder or silage crop substituted.

For a dairy farm having half the land in permanent pasture, a satisfactory four-course is (1) corn (cut for silage); (2) oats, the land being fall-plowed, the crop furnishing grain and bedding; (3) wheat (sown in fall, the grain being sold or consumed, the straw used for bedding); (4) clover (sown in spring in the wheat). This rotation permits of carrying the maximum amount of live stock and having a large supply of manure, thus enabling the crop-producing power of the soil to be maintained or increased. The live stock furnish constant employment and enable the farmer to make two profits, that of the grower and the manufacturer.

A common rotation in the Middle West is corn, wheat and clover. The wheat is sown in the corn with a one-horse drill before the latter is mature, the clover being sown in the wheat. Labor is a serious problem and this system economizes it, but one plowing being required.

Consult Wheeler, 'A Rotation of Crops,' Bull. 74, 75, 76, Agr. Exp. Sta., Rhode Island (1900); Gilbert, 'Memoranda of the Rothamsted Experiments' (1901).

SAMUEL FRASER,

*Instructor in Agronomy, Cornell University.*

**Rotch, rōch, Abbott Laurence,** American meteorologist: b. Boston, Mass., 6 Jan. 1861. He was graduated from the Massachusetts Institute of Technology in 1884, and in the following year established and has since maintained at his own expense a meteorological observatory at Milton, Mass. On 14 Dec. 1906 he was appointed professor of meteorology at Harvard University. He was the first meteorologist in the United States to measure the height and velocity of clouds, and to use kites with a self-recording instrument for this purpose. He also made experiments in wireless telegraphy. He has written 'Sounding of the Ocean of Air' (1900).

**Rotherham, rōth'er-am, England,** town in the West Riding of Yorkshire, at the confluence of the Rother and the Don, five miles northeast of Sheffield. The most notable buildings are the market-hall, post-office, court-house, corporation offices, council hall, and a large number of educational, literary, and benevolent institutions, including a mechanics' institute. The town possesses extensive metal works, potteries, glass works, and rope yards. It is of Roman origin and was of some importance in the Anglo-Saxon period.

**Rothermel, rōth'er-mēl, Peter Frederick,** American painter: b. Luzerne County, Pa., 8 July 1817; d. near Pottstown, Pa., 15 Aug. 1895. He was educated as a land surveyor, but at 22 studied painting, and about 1840 opened a studio as a portrait painter at Philadelphia, and eventually turned his attention to historical subjects. Among his earlier works are 'Christabel' and 'Katherine and Petruccio.' He has also painted many American subjects, among them 'De Soto Discovering the Mississippi,' 'Columbus Before Isabella the Catholic,' the 'Noche Triste' from Prescott's 'Conquest of Mexico'; 'Patrick Henry Before the Virginia House of Burgesses'; and 'The Battle of Gettysburg.' His pictures reveal a fine sense of color and a power of dramatic composition which are not common; but he has a tendency to exaggeration and his overtrained action is very often less genuinely effective than sensational.

**Rothschild, rōths'child (Ger. rōt'shilt).** The famous European financial house known as Rothschild was founded by Mayer Anselm Rothschild: b. Frankfort-on-the-Main 1743; d. 19 Sept. 1812. He was of Jewish parentage, and was destined for the priesthood, but found commercial pursuits more to his liking, and engaged in trading, afterward entered a banking house in Hanover. His industry, frugality, and sound business methods made him in a few years the master of a small capital, and he returned to Frankfort, where he established the banking house still in existence. The firm originally consisted of his five sons, who established branches of the house in different European cities: Anselm, b. 12 June 1773; d. 6 Dec. 1855; resided in Frankfort; Solomon, b. 9 Sept. 1774; d. 27 July 1855; lived in Vienna; Nathan, b. 16 Sept. 1777; d. 18 July 1836; located at London; Karl (Baron), b. 24 April 1788; d. 10 March 1855; resided in Naples, and Jacob (Baron), b. 15 May 1792; d. 15 Nov. 1868; resided in Paris. The political events of 1813 raised the house of Rothschild to the important position it has since occupied in the commercial and financial world. In 12 years the Rothschilds raised by way of loan or subsidy an amount exceeding £100,000,000 sterling which was distributed by them in nearly the following proportions: England, £40,000,000; Austria, £10,000,000; Prussia, £8,000,000; France, £16,000,000; Naples, £10,000,000; Russia, £5,000,000; several German courts, £1,000,000; Brazil, £2,000,000; exclusive of various other large sums. The remarkable degree of success attained by the house, setting aside the favorable circumstances of which they have taken advantage, may be largely attributed to their strict adherence to two fundamental maxims laid down by the founder of the house. The first

of these is their conducting all operations in common. Every proposition of magnitude is laid before each member of the firm, fully discussed, and then executed by their united efforts. The second principle is to set definite limits to each operation and never to aim at exorbitant profits. Their wealth has increased in an unexampled degree, and their reputation and credit have been steadily fortified by fair dealing, reasonable terms, and sagacious and systematic operations which are clearly planned and judiciously executed. The Rothschilds are extremely punctual in meeting their contracts, and before the introduction of the telegraph their couriers were frequently in advance of the government. The advantages of their system and their strength were clearly shown when in 1848 they met conjointly a loss of several millions, which would have crushed any other house, but which the enormous scope of their resources enabled them to meet without difficulty. The members of each succeeding generation are admitted into the firm and much intermarriage among cousins indicates that the family is destined long to retain its control of European finance. Lionel Nathan, b. 22 Nov. 1806; d. 3 June 1879, was the first Jew admitted to the English Parliament, and his son Nathaniel Mayer, b. 8 Nov. 1840; d. 13 June 1905, was created a baron in 1885. Since 1815 the Rothschilds have raised for Great Britain \$4,000,000,000; for Austria, \$250,000,000; for Prussia, \$200,000,000; for France, \$400,000,000; for Italy, \$300,000,000; for Russia, \$125,000,000; for Brazil, \$70,000,000; and in 1895 they purchased \$15,000,000 of the United States bonds controlled by the Belmont-Morgan syndicate. Consult: Reeves, 'The Rothschilds' (1887); 'Das Haus Rothschild' (1857); Von Scherb, 'Geschichte des Hauses Rothschild' (1893); Michaud et Villeneuve, 'Histoire de Saint-Simonisme et de la Famille de Rothschild' (1847).

Rotifera, a group of small, usually microscopic animals, are familiarly known as wheel animalcules, because of the presence at the anterior end of a crown of cilia which in their vibration suggest the rotation of a wheel. The opposite (posterior) end of the body is prolonged into a stalk (foot) which is the organ of attachment in sessile forms or is used in walking by such as are free. It is often segmented and may be terminated by one or two pointed toes, while a cement gland in the foot aids in fixation. The anatomy is simple and usually easily studied in the living animal. In general it recalls that of the embryonic annelid with which the rotifers are often genetically connected (see *TROCHILUMINIFERA*). A vascular system is wanting and the excretory system consists of "flame-cells." The sexes are separate, but the males are rare, degenerate, and needed only for the production of the fertilized winter eggs. Summer eggs develop parthenogenetically. The rotifers are abundant and widely distributed, but confined almost entirely to fresh water. They were among the very first of microscopic organisms to receive attention, and have always been favorite objects of study. A few forms are parasitic in habit and almost all are capable of desiccation and subsequent revival.

Rotteck, rôt'ték, Karl Wenzel von, German historian and publicist: b. Freiburg in Baden 18 July 1775; d. there 20 Nov. 1840. He was educated at the University of Freiburg, adopted the profession of advocate, but turned to the study of history, and in 1798 was appointed professor of that department in Freiburg University, a chair exchanged in 1818 for that of natural and international law. In 1819 he was chosen by his university as their representative in the first chamber of the states of Baden, and there proved an ardent champion of political reform. He was one of the founders of 'Der Freisinnige,' a journal with strong democratic leanings, and brought upon himself the displeasure of the conservative party, who compelled him to resign his professorship, and discontinue the editing of all public prints for five years. An ineffectual attempt was made to exclude him from the second chamber of the states, to which he had been elected representative in 1830; but he continued to hold this seat till his death. His chief work is 'Allgemeine Weltgeschichte' (1813-27). Numerous translations of the original work, or an abridgment published by Rotteck, entitled 'Auszug aus der Weltgeschichte,' have appeared in most European languages. It is a critical narrative of prominent events written from a liberal point of view. Other works are: 'Lehrbuch des Vernunftrechts und der Staatswissenschaften' (1829-30); 'Lehrbuch der ökonomischen Politik' (1835); 'Kleinere Schriften' (1829-30); and, with Welcker, a 'Staatslexikon' (1834-44).

Rottenstone, a decomposed mineral substance, consisting chiefly of alumina with about one ninth of carbon and half as much of silica. It is supposed to be formed almost wholly by decomposition of shale, and is chiefly found in Derbyshire, England, in South Wales, and near Albany, N. Y. It is either grayish, blackish, or reddish-brown in color, is soft and easily scraped to powder, and is much used for cleaning and polishing metallic surfaces, glass, etc. The term rottenstone is now used to include the tripoli of commerce (first imported from Tripoli, Africa), and also any kind of silicious material suitable for the same purposes.

Rotterdam, rôt'tér-dâm (Dutch, rôt-tér-dâm'), Netherlands, one of the chief cities and busiest ports of the country, 36 miles by rail southwest of Amsterdam. Important waterways connect the town with the sea and with the interior. Thus vessels of deep draft may approach quite near, and the amount of tonnage entering Rotterdam (including that which is connected with the inland traffic), is only surpassed by London among European ports. The Hoog Straat, built on the protecting dike, divides the city into Binnenstad and Buitenstad. The intersecting canals cut the Buitenstad into islands. The canals or "havens" are Rotterdam's streets, generally speaking, and the principal buildings line the main "havens." In the Groote Markt is a statue to Erasmus, who was a native of Rotterdam. Saint Lawrence Church, founded in 1414, contains an excellent organ and some fine marble monuments to celebrities. There are churches of all denominations, government offices, academy of fine arts, various museums, several hospitals, and good schools. There are also zoological gardens and a public park.

The modern public buildings form a remarkable contrast to the quaint old-time wooden gabled houses. Rotterdam carries on an active foreign and domestic trade with her colonies, Europe and America. The imports include native produce from her eastern and western colonies, and grain, coal, oil, seeds, etc. The exports are linen, flax, dairy products, gin, and manufactures. Rotterdam boasts many flourishing mills and other industrial works. Pop. about 338,000.

**Rotti**, rôt'té, Rottee, or Rotto, an island belonging to the Netherlands, in the Indian Ocean, northwest of Australia and southwest of Timor Island. It is of volcanic origin; its greatest length is 36 miles, and greatest width 11 miles. It has a bold, rocky coast; the surface of the interior is undulating and the soil is very fertile. The lontar, or palmyra palm, furnishes a juice which is one of the principal articles of food. Maize, rice, millet, cotton, and tropical fruits are plentiful, and cabinet woods are exported. Horses, goats, sheep, pigs, and buffaloes abound. Edible birds' nests and wax are also exported. The natives, supposed to have come originally from Java, are a fine looking race. Pop. about 70,000.

**Rottmann**, rôt'män, Carl, German painter: b. Handschuchheim near Heidelberg 11 Jan. 1798; d. Munich 6 July 1850. He early established himself at Munich, but finding little congeniality in the studies of the academy, interested himself in the natural scenery of the country, which formed the environs of the city, and by his independent studies he actually instituted a new school of German landscape. His masterly pictures attracted the attention of King Louis, who engaged him to paint a series of Italian landscapes; and his frescoes, executed between 1829 and 1833 in the arcades of the palace gardens, are remarkable for color and masterly power in line. Among his oil paintings may be mentioned: 'The Acropolis of Sicyon' and his 'View of Corfu,' now at Munich in the new picture gallery; 'The Fountain of Callirrhoe,' at Munich; 'Perugia,' in the National Gallery at Berlin. While he was a powerful and imaginative painter in oil, his chief claims to recognition in modern art history are his mastery of water colors and his skill in genuine naturalism.

**Roubaix**, roo-bä, France, in the department of Nord, six miles northeast of Lille, is a prosperous manufacturing town, containing many mills and factories, dye works, and tanneries. Its public buildings are unimportant. Its woolen and linen manufactures and its carpets are celebrated.

**Roubillac**, roo-bä-yäk, Louis François, French sculptor: b. Lyons about 1695; d. London 11 Jan. 1762. He settled in England about 1720, and a monument designed by him for the Duke of Argyll in Westminster Abbey brought him into great repute. Among his monumental works are statues of Bishop Hough in Worcester Cathedral; of Sir Peter Warren; of Handel in Westminster Abbey; of Shakespeare in the British Museum; and of Sir Isaac Newton at Cambridge.

**Rouen**, roo-än, France, chief town of the department of Seine-Inférieure, situated on the

right bank of the Seine. 87 miles southwest of Paris, ranks next to Lyons as a manufacturing city, and is one of the most attractive provincial towns of the republic. Rouen possesses much interest in its public buildings, many of which are almost perfect specimens of Gothic architecture. They include the venerable cathedral of Notre Dame, the product of centuries of construction; begun in 1220 under Philippe Auguste, it has seen many vicissitudes, but its imposing façade surmounted by lofty towers, its richly decorated walls, its exquisite wood carvings, fine sculpture, and beautiful rose-windows, render Notre Dame one of the most remarkable and artistic of Christian temples. The abbey and church of Saint Ouen also in the Gothic style, whose aerial tower terminates in a crown of fleurs-de-lis; the Church of Saint Maclou, a fine specimen of florid Gothic; the Tour de la Grosse-Horloge; the Palais de Justice, of the 15th century, remarkable for the delicacy and boldness of construction; the Hotel de Bourgtheroulde (15th century), with fine reliefs; the archiepiscopal palace; the musée or picture gallery, containing a fine collection of paintings by French masters; and the ancient Halls or market buildings. There is a large library and several museums of scientific collections. In the Place de la Pucelle Joan d'Arc was burnt. Rouen is the birthplace of Corneille, Fontenelle, Boieldieu, and Flaubert. It is the see of an archbishop, and seat of law courts, and possesses a chamber of commerce, an exchange, mint, and schools of science, art, and the higher professions. The staple manufacture is cottons, in every form, one class of which is so specialized as to be known as *rouenneries*. Besides woolen goods, machinery, chemicals, etc., there are numerous industrial works for weaving, refining, and smelting. The location of the city favors trade. The main articles are corn, flour, wool, cotton, coal, petroleum, wine, brandy, colonial produce, and manufactured goods. Rouen was built before the conquest of Gaul by the Romans. It was captured and pillaged by the Normans in the 9th century. Then it was long held by the English until 1449. Pop. about 120,000.

**Rough and Ready**, a popular nickname applied to President Zachary Taylor during the Mexican War.

**Rough-leg**, a buzzard-hawk of the genus *Archibuteo*, especially *A. lagopus*, so called because feathered down to the toes. It is known throughout the northern regions of both continents, and is typically whitish, streaked with rust-red; but the American form best known is a melanotic variety (*A. lagopus sancti-johannis*), which frequents the maritime districts of the Atlantic coast, and is less often seen in the interior, except northerly. The western United States and Pacific coast have a second species (*A. ferrugineus*), called in California squirrel-hawk, which is rusty brown, marked with gray, white, and black; or sometimes plain dark chocolate brown. These hawks are large (23 to 24 inches in length), and of fierce and noble appearance; but they have none of the dash and spirit of the falcons, and indeed seem inferior to the buteos in this respect. Their quarry, though diversified, is always humble; they prey upon various field-mice and other very small quadru-

peda, lizards, and frogs, and even insects, rarely attacking birds of any kind, and then only the most defenseless. Open fields, especially in the vicinity of water, are their favorite resorts. They appear heavy and indisposed to active exertion; flying slowly and heavily, and often remaining long motionless on their perch. They show some analogy to the owls in points of structure, as well as in their partially nocturnal habits. Wilson observes that it habitually courses over the meadows long after the sun has set, and Audubon calls it the most nocturnal of our species. The nest is ordinarily built of sticks, etc., in a high tree; sometimes, however, on cliffs. The eggs, three or four in number, measure about  $2\frac{1}{2}$  by  $1\frac{3}{4}$  inches, largely blotched with different shades of brown, sometimes mixed with purplish slate markings.

**Rough Riders**, a name borne by the 1st Regiment of United States cavalry and also by the 2d United States volunteer cavalry in the Spanish-American War. The original Rough Riders were the men who carried messages through the Western States before the organization of the pony express in 1859, and the name was used by William F. Cody in his "Wild West" show, which contained a "Congress of the Rough Riders of the World." The army regiments were thus named because of the great number of western ranchmen in their ranks, and played a prominent part in the Spanish-American War. The first regiment was organized by Leonard Wood, who was commissioned colonel, and Theodore Roosevelt became lieutenant-colonel. Before the disbanding of the regiment in 1898 a Rough Riders' Association was formed, to which all members of the regiment are eligible, the right of membership to descend to the eldest son. See ROOSEVELT, THEODORE, and WOOD, LEONARD.

**Rough-winged Swallow**, a small blackish migratory swallow (*Stelgidopteryx serripennis*) of the United States generally, where it nests in summer in holes in banks, in crevices of rocks, etc., and has the general habits of the bank swallow (q.v.). The genus, of which several other species are known in Central and South America, is peculiar in having the outer web of the first wing-quill converted into a series of stiff recurved hooks, which may be supposed useful in creeping into their holes and in clinging to vertical or overhanging surfaces. Considering the general likeness of the bird otherwise to the bank swallow, the fact that this species often makes its nest and lays its pure white eggs in some cranny about a bridge or building is noteworthy. Consult CONES, 'Birds of the Colorado Valley' (1878).

**Rouge**, roozh, a cosmetic prepared and used to impart artificial bloom to the cheeks or lips. It is applied by means of a camel's hair pencil, puff-powder, or a hare's foot. When rouge is properly prepared, it is said that its application does not injure the skin. Jeweler's rouge is an impalpable preparation of oxide of iron, obtained by heating the yellow oxalate of iron till it decomposes, carbonic acid escaping, and only a red powder being left. It is used for polishing silver, and for this purpose should be of the finest quality.

**Rouge et Noir**, roozh à nwör, or **Trente et Quarante**, trönt à kã-ränt, a modern game

of chance played with the cards belonging to six complete packs. The punters or players stake upon any of the four chances: *rouge*, *noir*, *coulour*, and *inverse*. The banker then deals a row of cards for *noir*, until the exposed pip number between 30 and 40 (court-cards count 10, aces 1), and a similar row for *rouge*. That row wins which most nearly approaches the number 31, and players staking on the winning color receive their stake doubled. *Coulour* wins if the first card turned up in the deal is of the winning color; in the contrary case *inverse* wins. When the number of pips in both rows are equal it is a *refait*, and a fresh deal is made; but if both happen to count exactly 31 it is a *refait de trente-et-un*, and the banker claims one half of all stakes. This last condition places the banker at an advantage calculated to be equal to about  $1\frac{1}{4}$  per cent on all sums staked.

**Rouget**, Georges, zhörzh roo-zhã, French painter: b. Paris 5 May 1784; d. there 9 April 1869. He studied at the Ecole des Beaux Arts, and later under David, who employed him to finish many of his pictures. He became in consequence an imitator of that master. He painted a large number of portraits, those of Louis XVIII. and of Charles X. being noteworthy, and historical subjects. Of the latter are: 'French Princes Paying Homage at the Cradle of the King of Rome' (1812); 'Death of St. Louis' (1817), at Versailles; 'Œdipus and Antigone' (1819), at Rouen; 'Francis I. Pardoning Rebels of La Rochelle' (1822); 'Marriage of Napoleon and Marie Louise' (1837); 'Napoleon Receiving the Decree of the Senate Proclaiming Him Emperor' (1838); 'Death of Napoleon' (1846). Several of the churches of Paris contain religious subjects painted by him; but the major part of his work may be seen at the Versailles Museum.

**Rouget de Lisle**, roo-zhã de lêl, Claude Joseph, French song-writer: b. Lons-le-Saulnier, France, 10 May 1760; d. Choisy-le-Roi 27 June 1836. He published 'Fifty French Songs, Words of Various Authors, Set to Music by Rouget de Lisle' (1826); etc., but is chiefly remembered as the author of both the words and music of 'The Marseillaise' (q.v.).

**Rougon-Macquart**, roo-gôn mã-kãr, Les, a series of 20 novels by Emile Zola, relating the history of a family under the Second Empire and published 1871-93. The novels were intended to form a scientific study of heredity as well as a photograph of French social life. The series begins with 'La Fortune des Rougons' (1871), and this was followed by 'La Curée' (Rush for the Spoil: 1872); a study of the financial world of Paris at the time Haussmann laid out the boulevards; 'La Conquête des Plassans' (1874); 'Le Ventre de Paris' (The Markets of Paris; or Fat and Thin: 1875); 'La Faute de l'Abbé Mouret' (1875); 'Son Excellence Eugène Rougon' (1876), a story of political life; 'L'Assomoir' (Drink: 1877), a story of life among the workmen of Paris; 'Une Page d'Amour' (1878), a physical and psychological study of the various phases of a woman's passion; 'Nana' (1880), a study of the life of a courtesan and actress; 'Pot-Bouille' (1882), a study of the life of the bourgeoisie; 'Au Bonheur des Dames' (The Ladies' Paradise: 1883), a study of the mammoth de-

partment stores; 'La Joie de Vivre' (1884); 'Germinal' (Master and Man: 1885), a study of life in the mines; 'L'Œuvre' (1886), a study of artist life; 'La Terre' (1888), a study of peasant life and the greed for land; 'Le Rêve' (1888); 'Le Bête Humaine' (1890), a study of railway life; 'L'Argent' (1891), a study of stock speculation; 'La Débâcle' (The Downfall: 1892), a study of the Franco-Prussian war and the Siege of Paris; 'Le Docteur Pascal' (1892). In this last story Pascal Rougon collects all the data relating to his family, and sums up their history.

**Rouher, Eugène**, è-zhân roo-är, French statesman: b. Riom 30 Nov. 1814; d. Paris 3 Feb. 1884. He studied law and practised his profession in Riom until his election to the Legislative Assembly in 1849. He became a confidant of Napoleon III. and was appointed minister of justice. In 1863 he was made minister of state, and in 1870 became president of the Senate and chief of the Napoleonic cabinet. In 1860 the famous treaty with England was effected largely through his instrumentality in which the free trade policy of Napoleon was inaugurated. His activity in state affairs continued until the fall of the empire when he fled from France. In 1872 he returned as the Corsican representative in the Assembly, and remained in office until 1875. He was to the last the leader of the Bonapartists.

**Roulers, roo-lä** (Flem. *Rousselaere*), Belgium, on the Maandel, 17 miles south of Bruges, carries on an active industry in the manufacture of textiles, and a trade in linen, chicory, etc. Pop. about 25,000.

**Roulette, roo-lët**, a French game of chance, in which a small ivory ball is thrown off by a revolving disk into one of 37 or 38 compartments surrounding it, and numbered from 1 to 36, with one or two zeros. Players who have staked upon the number of the compartment into which the ball falls receive 36 times their stake; less if they have staked upon more than one number. There are also other chances on which stakes may be placed.

**Roumania, a variant spelling of RUMANIA (q.v.).**

**Roumanille, roo-mä-nël-é**, Joseph, modern Provençal poet: b. Saint-Remy, near Avignon, 1818. He was the first French poet to conceive the idea of reviving, as a literary tongue, the local dialects of southeastern France. Accordingly he gathered round him an enthusiastic band of friends, and with their assistance collected materials for a grammar and lexicon and also founded a consistent system of orthography. It was in his programme to produce, and favor the production of, genuine poetry, such as would speak to the hearts of the peasantry to whom this dialect was vernacular. In 1852 he edited a collection of Provençal poems by several authors under the title 'Li Provençalo.' It was mainly under his inspiration that the society of the 'Felibres' was formed, and he was the second president of its consistory.

**Round, William Marshall Pitts**, American journalist and reformer: b. Pawtucket, R. I., 26 March 1845; d. Achusnet, Mass., 2 Jan. 1906. He was educated at Harvard, became a journalist

and engaged actively in prison reform. He had served as United States delegate to various European prison congresses, was director and corresponding secretary of the National Prison Association, which he reorganized, and he also organized the Burnham Industrial Farm at Canaan, N. Y. He was the originator of the 'Mill' system of awards, now used in many institutions both at home and abroad, and was editor of 'Lend-a-Hand Record.' He wrote 'Achash' (1877); 'Child Marian Abroad' (1880); 'Rosecraft' (1884); 'Torn and Mended' (1885).

**Round**, a short, simple musical composition, written generally for three or more voices on the same clef. Each voice takes up the melody after the first has sung the first phrase or so, the third following the second, as it followed the first, and so on, until after a certain number of repetitions the signal is given to stop. It is evident that the melody must be so constructed that each phrase must harmonize with the other, so that, when all the voices are singing, a three- or four-part harmony is heard.

**Round Robin**, a written protest or remonstrance, signed in a circular form by several persons, so that no name shall be obliged to head the list. This method of bringing grievances to the notice of superiors was first used by French officers, whence its derivation from *round ruban*, "round ribbon."

**Round Table**, *The*. See ARTHURIAN LEGEND.

**Round Towers**. See TOWERS.

**Roundabout Papers**, *The*, the title of a work by William Makepeace Thackeray. He became editor of the 'Cornhill Magazine' in 1850 and 'The Roundabout Papers' were sketches for this periodical. They appeared simultaneously, between 1850 and 1863, with 'Level the Widower' and 'The Adventures of Philip,' and represent the author's best qualities as an essayist.

**Roundelay**. (1) A song of any sort in which a line, refrain, or idea is constantly repeated. (2) The tune of such a song. (3) A dance in a circle. (4) Specifically, a fixed verse-form, originating in France, and better known as the *rondeau* (q.v.).

**Rounders**, a game played with a bat and a ball by two parties or sides, on a piece of ground marked off into a square or circle or pentagon, with a batter's station, and three (or more) goals or bases at equal distances. On the ball being thrown toward him the batter tries to drive it away as far as he can and run completely round the goals, or over any one of the four parts, before the ball can be thrown back to the batting station. The batter is declared out if he fails to secure a run after having had three balls, if a fielder returns the ball so as to strike him while running, or if the ball from his bat is caught in the air by one of the fielders. See BASEBALL.

**Roundfish**. See WHITEFISH.

**Roundworms, or Thread-worms**, worms of the phylum *Nemathelminthes* (q.v.), so called because of their elongated and cylindrical form. They are separable into three classes: (1)

*Nematode*, or roundworms, strictly speaking; (2) *Acanthocephala*, the hook-headed or spiny-headed worms; and (3) *Cetognatha*, the arrow-worms,—a small class of obscure pelagic organisms. The most celebrated of the nematodes is the common roundworm (*Ascaris lumbricoides*), which infests the human intestines, especially in the case of children, who are said to "have worms." These parasites look like earthworms, are 5 to 15 inches long in the grown female, and a quarter of an inch thick, yellowish, with a dorsal and ventral white line, and two brown lateral lines. The three-lobed mouth is terminal at the anterior end, and the anus near the pointed "tail," which varies in form with the sexes. The organization is complicated, and the sexes are always separate, and the males always the smaller. The eggs are produced at the rate of several thousands a day. After fertilization they are enclosed in a tough shell, and are voided by the host with the feces. How the worm gains access to the human intestine is not precisely known. "It is possible," say Parker and Haswell, "that the eggs containing developing embryos, or the embryos themselves, after liberation from the egg-shell, may be taken in by drinking, without previous filtering, water into which fecal matter has been discharged. On the other hand it is quite possible that there may be an intermediate host, such as . . . occurs in several members of the class." Aside from occasional inflammations of the intestine, and obstruction of the bowel from their clumping, they cause no great harm, and various medicines, called vermifuges, expel them. Other species inhabit the intestines of the pig, the horse, the frog, etc. The last named (*A. nigroviridis*) is remarkable in being hermaphroditic, and for its life-cycle. It begins by the worm entering from the water the mouth of a frog and making its way into the lungs, where it resides long enough in a hermaphroditic condition to produce eggs. These hatch and the embryos cut their way through to the enteric canal, where they escape with the feces. Then they develop into a mature form (*rhabditis*) in which the sexes are separate; in this the fertilized eggs develop in the body of the female, and when fully formed make their way through the walls of the uterus and proceed to devour the whole substance of the mother, leaving only the cuticle. Gaining their freedom they exist in the mud until taken into some frog's mouth, and a new cycle is begun. This is the form of alternate generations called heterogeny—the alternation of a hermaphroditic with a dioecious form.

Closely related to this are various parasitic nematodes, of which one is the thread-worm (*Oxyuris vermicularis*), or "pin-worm," which infests the rectum or lower bowel of children particularly, and gives rise to distressing symptoms, chief of which is an intolerable itching. Its length averages a quarter of an inch; and occasionally inflammation results from their presence in large numbers.

The oel-worms (*Gordius*), guinea-worms, vinegar-cels and similar more or less dreadful parasites also belong here, the worst of which, perhaps, is the trichina.

The class *Acanthocephala*, or spiny-headed

worms, includes a few genera of parasitic worms of which *Echinorhynchus* is chief. Most are minute, but *E. gigas*, affecting the pig, may be 12 to 18 inches long; few other cases of their affecting mammals are known, the majority of species infesting inferior animals. These worms have at the head a protrusile proboscis, covered with rings of recurved hooks, which is buried in the wall of the intestine of the host, enabling the worm to hold its place. The development is complicated. The embryos escape from the intestines of the host, and die unless they are swallowed by some creature suitable for the development, such as certain shrimps for the fish-parasites, and a beetle for *E. gigas* of the pig. Should this "intermediate host" be eaten by the fish or the pig the developing worm fixes itself in the intestine and matures. See EEL-WORM; FILARIASIS; GUINEA-WORM; PARASITISM; TRICHINOSIS. Consult: Parker and Haswell, "Text-book of Zoology" (1897), and authorities cited under PARASITISM.

**Rouquette**, roo-két, Adrien Emmanuel, American Roman Catholic priest and author: b. New Orleans, La., 13 Feb. 1813; d. there 15 July 1887. He was educated in France, where he studied law, and was graduated from the University of Rennes in 1833. Returning to America he abandoned law for the priesthood and his cherished career as a missionary to the Choctaw Indians, among whom he had spent some years in his boyhood. In 1839 he established a mission in the Indian village at Bayou Lacombe, and thenceforth devoted his life to the Choctaw people, by whom he was greatly beloved. His writings include: "Les Savanes, Poésies américaines" (1841); "Poèmes patriotiques" (1860); "Catherine Teghekwittha" (1873).

**Rouses** (rows'z) Point, N. Y., village, port of entry, in Clinton County; on Lake Champlain, and on the Delaware & H., the Rutland, and the Grand Trunk R.R.'s; on the boundary between the United States and Canada; about 160 miles north by east of Albany and 21 miles north by east of Plattsburg. A railroad bridge about one mile in length spans the portion of the lake between the State of New York and Grand Isle, in Vermont. The village has steamer connections with the Lake Champlain ports, and by way of the lake and the Richelieu River with many places in Canada. Rouses Point receives a large part of the custom receipts of the Champlain district. In 1900 the imports were \$15,309,725 and the exports \$5,211,770. The manufactories are a large printing house, railroad repair shops, lumber mills, and machine shops. It has the Charbonneau Institute, a high school, public and parish schools, and two public libraries. Rouses Point was a noted locality in the discovery days, and at the time of the Revolution and the War of 1812. Just on the frontier, on an island, is Fort Montgomery. Pop. (1890) 1,856; (1900) 1,675; (1910) 1,638.

**Rousseau**, roo-sô, Jean Baptiste, French poet: b. Paris 6 April 1671; d. Brussels 17 March 1741. In 1701 he was admitted into the Academy of Inscriptions and Belles-lettres, and his lyric compositions procured him high reputation among the French literati; but his turn

for satire and his quarrelsome temper at length involved him in disgrace. He was found guilty of having written against persons of consideration, and was exiled from France in 1712. The latter part of his life was spent in the Netherlands, where he obtained a pension from the Duke of Artemberg, which he resigned on having forfeited the favor of that nobleman. An edition of his works was published under his own inspection, by Tonson 1723, and since his death they have been often printed in various forms. One of the best editions is that of Amar, with a commentary and life of the author (1820). The same editor has also published his 'Œuvres Poétiques' with a commentary (1824).

Rousseau, Jean Jacques, zhôn zhâk, French author: b. Geneva, Switzerland, 28 June 1712; d. Ermenonville, near Paris, 2 July 1778. In 1726 he was articled to an engraver, whose severity disgusted him with his situation. He therefore ran away from his master, and after wandering for some days arrived at Conignon, where he was received into the house of the curé of the village, and for some time hospitably treated. By this clergyman he was recommended to the notice of Madame de Warens, who sent him to a charitable institution in Turin, where he abjured Protestantism in favor of Catholicism. He left Turin to lead an unsettled existence. In the autumn of 1741 he went to Paris, where, under the recommendation of Réaumur, he read a paper before the Academy of Sciences on certain grand improvements he fancied he had made in musical notation. That body came to the conclusion that, though the improvements were ingenious, they were neither new nor practicable. He lived a very precarious life in the capital, without fixed abode or means of support, until appointed secretary to M. de Montaigne, French ambassador at Venice. After a residence of a year and a half in that city he quarreled with his harsh and avaricious chief, and returned to Paris in 1742, and there earned his living by copying music, employing his leisure hours in the study of natural science. About this time he became intimate with Diderot, Grimm, D'Holbach, and Madame d'Épinay. In 1750 he gained the prize offered by the Academy of Dijon, on the question whether the revival of learning has contributed to the improvement of morals, taking the negative side of the question, it is said, at the suggestion of Diderot. He soon after brought out his 'Devu du Village,' a comic opera, of which he had himself composed the music. This piece was received with general favor, and the author was almost worshipped by the French; but the appearance of his celebrated 'Letter on French Music' (1753), in which he pointed out its defects, excited a general storm. Singers and connoisseurs who could not wield the pen contributed to spread calumnies, pasquinades, and caricatures against the author, who retired to Geneva. By his change of religion he had lost the rights of a citizen. He now again embraced Protestantism, and was formally reinstated in the privileges of a free citizen of Geneva. From Geneva Rousseau went to the Hermitage, a retreat near Paris, provided for

him by Madame d'Épinay (1756), but the next year quitted the Hermitage and returned to Paris; and fixing himself at Montmorency, finished his 'Contrat Social,' his 'Julie, ou la Nouvelle Héloïse,' and his 'Emile.'

His celebrated work on education, 'Emile, ou de l'Éducation' (1762) was condemned by the Parliament of Paris on account of its religious views, and he himself sentenced to imprisonment. He wished to retire to Geneva, but was also threatened with imprisonment there, and his book was burned by the common hangman. He therefore took refuge in Moitiers-Travers, a small village of the Prussian province of Neuchâtel, where he again found himself among Protestants, the simplicity of whose worship was agreeable to him. Here, too, he obtained a protector and friend in the person of Marshal Keith, governor of the province, but the intrigues of his enemies pursued him even thither. The Geneva clergy assailed him from their pulpits, and he wrote his celebrated 'Letters from the Mountains' in reply to their attacks. This work, with his 'Letter to the Archbishop of Paris,' and his 'Dictionnaire Physique Portatif,' were publicly burned in Paris in 1765. New troubles drove him from Moitiers, and he resided two months on Peter's Island, in the Lake of Biennne. His residence here produced his 'Botaniste sans Maître.' Neither was he long tolerated here; the authorities of Berne ordered him to quit the country without delay in the severest season of the year. On reaching Paris he became the object of ridicule to the philosophers, but was kindly received by Hume, whom he accompanied to England; but yielding to his unfounded suspicions of his friends in England he left the country, and returned to Paris in 1767. In 1768 he published his 'Musical Dictionary,' and soon after appeared his melodrama of 'Pygmalion.' In May 1778, he retired to Ermenonville. The principal traits of Rousseau's character were an enthusiastic passion for love and freedom, a spirit of paradox, an inflexible obstinacy, and a warm zeal for the good of men, combined with a gloomy hypochondria. His influence was great in Europe, particularly in France, where it contributed toward the Revolution. There are standard editions of his works by Augius (1822) and Musset-Pathay (1823-6). Consult also Rousseau's own 'Confessions'; de Rothschild, 'Lettres Inédites de J. J. Rousseau' (1892); and the 'Lives' in French by Girardin (1875) and Chuquet (1893), and in English by Morley (1873).

Rousseau, Lovell Harrison, American soldier and legislator: b. Stanford, Ky., 4 Aug. 1818; d. New Orleans 7 Jan. 1869. He was admitted to the bar in 1841, engaged in practice at Bloomfield, Ind., and was a member of the Indiana legislature 1844-5. He served in the Mexican War and in 1849 opened a law office in Kentucky, and became famous as a criminal lawyer. In 1860 he entered the Kentucky senate, but resigned to join the Union army. He was commissioned brigadier-general of volunteers in 1861, promoted major-general in 1862, and fought at Stone River, Chickamauga and Chattanooga. From 1863-5 he was in command of the district of Tennessee and successfully

JEAN JACQUES ROUSSEAU.

defended Fort Rosecrans during the siege of Nashville. He took his seat in Congress in 1865, but in the following year resigned it in consequence of being reprimanded by that body for a public assault upon Representative Grinnell of Iowa. He was, however, soon re-elected and served another year. In 1867 he was appointed brigadier-general in the regular army and assigned officially to receive Alaska from Russia and assume control of the territory. He was summoned from this post to testify in the trial for impeachment of President Johnson and was afterward until his death in command of the Department of the Gulf with headquarters at New Orleans.

**Rousseau, Pierre Etienne Théodore**, French painter: b. Paris 15 April 1812; d. Barbizon, near Fontainebleau, 22 Dec. 1867. He was a pupil of Rémond (1826) and of Lethière, but quickly parted company with all current theories of art, and showed himself an original interpreter of nature, while he fought the battle of the new landscape—"paysage intime"—through the 13 years during which his pictures were excluded from the Salon by the Academic Jury, which has since then been happily abolished. He traveled through the Auvergne and Normandy and painted the scenery with the main object of breathing human feeling into the colors and forms of external nature. He is the central figure of the Barbizon school and must be looked upon as the founder of the modern school of French landscape painting, as opposed to the Romanticism of Claude Lorraine, Poussin and their followers. It has been well said of him: "He occupied the highest place because he was the most perfect master. The grand aspect of landscape and its tenderness are equally familiar to him. He renders with the same mastery the smile of creation and its terrors; the broad open plain and the mysterious forest; the limpid, sun-bright sky or the heaping of the clouds put to flight by storms; the terrible aspect of landscape or those replete with grace. He has understood all, rendered all, with equal genius. The greatest contemporary painters have each a particular stamp, Corot painting the grace; Millet, the hidden voice; Jules Dupré, the majestic strength. Théodore Rousseau has been by turns as much a poet as Corot, as melancholy as Millet, as awful as Dupré; he is the most complete, for he embraces landscape art absolutely."

In 1848 he took up his residence on the edge of the forest of Fontainebleau and derived most of his inspiration from the surrounding scenery. How he drew the motif of his work from this environment is seen in the fine picture in the Metropolitan Museum, New York, 'Edge of the Woods.' Among other characteristic works may be mentioned: 'View of the Valley of Paris and the Banks of the Seine'; 'The Forest Height of Compiègne' (1833); 'Avenue of Isle-Adam'; 'Entrance to the Forest of Fontainebleau' (1862); and 'Marsh in the Landes' (1854); the last two being in the Louvre. His early style was sketchy with some carelessness of touch, although absolutely sincere and impressionistic. Latterly he indulged in excessive detail,

and never seemed to know when his pictures were finished, but all his landscapes were tinged with the deepest poetic spirit. Yet he never really won recognition during his lifetime, and after an unsuccessful auction sale of his works in 1861 thought seriously of seeking a home in some foreign capital. It is said that the sense of this depreciation wore away his health. Yet in the last year of his life he took the medal of honor and since his death the genuine merit of his pictures has been acknowledged and as early as 1873 his 'Scene near Fontainebleau' was sold for \$2,360. Consult: Sensier, 'Souvenirs de Théodore Rousseau' (1872).

**Rove-beetles, or Cocktails**, names applied to a tribe of Beetles, the *Staphylinidae*, characterized by elytra only about one fourth of the length of the abdomen. A common species is the 'Devil's Coach-horse,' (*Gorrius olens*), a fanciful name given to it from its diabolical aspect when it curls up the abdomen and opens its jaws. These beetles are carnivorous in habits, and are apt to bite if incautiously handled. The habit of cocking the tail has been alleged to have for its object the function of pushing the hinder wings under the short elytra, which are formed by the front wings and which protect the hinder or functional wings. These beetles fly about chiefly in the dusk and at night. The tarsi generally possess five joints.

**Rowuma, rô-voo'mā**, a river of Africa, which rises east of and near Lake Nyassa, and flows east into the Indian Ocean. It forms the boundary between German East Africa and Portuguese East Africa. It is about 500 miles long. For about 80 miles from the mouth, there are high lands along the banks, and about 160 miles from the ocean are a number of beautiful cascades and waterfalls. The river is navigable for some distance.

**Rowan, rô'an, Andrew Summers**, American army officer: b. Gap Mills, Va., 1859. He was graduated from West Point in 1881 and after the opening of the Spanish-American war in 1898 was sent to communicate with General Garcia. He made a landing from an open boat near Turquino Peak, Cuba, on 24 April 1898, and with much difficulty succeeded in reaching Garcia, obtained full information of the insurgent army, and made the return trip successfully. He was promoted 1st lieutenant, U. S. A., for this service, and in 1899-1900 was on duty in the Visayas Group, Philippine Islands. He has since been professor of military science and tactics at the Kansas State Agricultural College. He has written 'The Island of Cuba' (1898).

**Rowan, Stephen Clegg**, American naval officer: b. near Dublin, Ireland, 25 Dec. 1808; d. Washington, D. C., 31 March 1890. He came to the United States when very young and in 1826 was appointed a midshipman in the navy, receiving promotion to lieutenant in 1837. He saw active service in the Mexican War and in 1855 he was appointed commander. At the outbreak of the Civil War he was in charge of the Pawnee, and on 25 May he engaged in the attack on the Confederate batteries at Aquia Creek, the first naval engagement of the War. He assisted in the capture of Fort Hatteras and was promoted captain and commodore for

## ROWBOTHAM — ROWING

his services. He was engaged at Roanoke Island and Albemarle Sound, and later captured Fort Mason, thereby restoring National authority in North Carolina. He was in command of the New Ironsides at Forts Wagner, Gregg, and Moultrie, received the thanks of Congress, and in 1866 was promoted rear-admiral. He became vice-admiral in 1870, and from 1883 until his retirement in 1889 was chairman of the light-house board.

**Rowbotham, rō'bōt-ām, John Frederick**, English Anglican clergyman, poet, and historian: b. Bradford, Yorkshire, 18 April 1859. He was educated at Oxford, traveled extensively on the continent, and took orders in the Church of England in 1891. He was vicar of Ratley in 1892, rector of Huntley in 1895, British chaplain of Budapest and Hungary in 1896, and vicar of Abbotsley 1897-1900. He has published: 'The History of Music' (3 vols., 1887); 'Poetical Works' (1889-90); 'The History of the Troubadours and the Courts of Love' (1895); 'The God Horus, a Novel of Ancient Egypt' (1898); 'The Human Epic' (1902); etc.

**Rowe, rō, George Fawcett**, English-American actor: b. Exeter about 1829; d. New York 29 Aug. 1889. He made his first appearance on the stage in Australia in 1854; toured through India, China, and Peru, and appeared in New York in 1866 under Mrs. John Wood's management at the Olympic. His most famous part was Wilkins Micawber in Halliday's dramatization of 'David Copperfield.' He also played Silas Wegg in 'Our Mutual Friend,' and many other comic and farcical parts, some in pieces of his own composition, such as 'Brass'; 'The Geneva Cross'; 'Found Drowned'; and 'The Sleigh Bells.' His last appearance was at the Colosseum Theatre, London, as Rufus Potts in 'Forward to the Front,' 27 April 1889.

**Rowe, Nicholas**, English dramatic poet: b. Little Barford, Bedfordshire, 1674; d. 6 Dec. 1718. He studied at Westminster, entered a student at the Middle Temple; but turned his chief attention to literature. At 24 he produced his tragedy of the 'Ambitious Step-mother'; 'Tamerlane' followed in 1702. His next dramatic performance was the 'Fair Penitent,' remodeled from the 'Fatal Dowry' of Massinger. In 1704 he wrote 'The Biter,' a comedy, which being a failure, he thereafter kept to his own line, and from that time to 1715 produced his 'Ulysses,' 'Royal Convert,' 'Jane Shore,' and 'Lady Jane Grey.' On the accession of George I. in 1715 he was made poet-laureate. He wrote a few tender and pathetic ballads, translated Lucan's 'Pharsalia,' and edited the plays of Shakespeare (1709). The memoir prefixed to the plays contains much traditional matter judiciously presented.

**Rowing, Mechanics of.** Rowing is the method of propelling a boat by the use of oars. It consists of two parts—the stroke, and the feather, which are executed by a series of very complicated motions designed to apply a maximum of available motive energy in pushing the boat through the water, and at the same time insure the least amount of deviation from a straight course.

In preparing to row, the oarsman sits on the thwart, facing the stern and exactly opposite the handle of his oar, the loom of which

rests in the rowlock with the button on the inner side of the thowl pin. To obtain the maximum effect from the power exerted, he should sit about two inches from the after edge of the thwart, the body being held square and upright, the back straight and rigid, the feet pressed firmly against the opposite stretcher or foot board with the heels close together and the toes apart, so as to keep the knees separate. The handle of the oar should be held firmly by both hands which should be about three inches

FIG. 1.—Position beginning of stroke.

apart, with the outside one close to the end of the handle, the fingers being above and the thumb underneath. The grasp should be a flexible hold with the fingers and not a clutch with the whole hand. The forearms should be kept below the level of the handle, with the elbows down, close to the sides of the body. The wrists should be relaxed and dropped, so that the oars will lie flat upon the surface of the water.

The stroke is characterized by three distinct phases—the beginning, the pulling through, and finishing, and the 'recovery' which includes

FIG. 2.—Position half-way through stroke.

the "feather." In taking the stroke, the body is inclined forward, the backbone being kept straight and rigid, the chest thrown forward and held up as high as possible, while the stomach is kept well out and down between the legs. The arms should reach out perfectly straight from the shoulders to the wrists, and the action of the shoulder joints and the hips should be

## ROWING

perfectly free and easy. In reaching forward, the oar handle is grasped firmly by the fingers, and the hands are shot out quickly straight from the body, and as soon as the oar has passed over the knees, the wrists are raised so as to bring the blade at right angles to the surface of the water and preparatory to dipping it, at the beginning of the stroke when the arms reach the extreme limit of their forward movement di-

ward at the wrists until the knuckles touch the breast, so as to produce the "feather," in which the flat of the blade is made parallel with the surface of the water; then the arms are shot forward again close along the legs, accompanied by the forward swing of the body, in the "recovery." A quick recovery is effected by keeping the back straight and rigid, the knees not dropped too low, and by bracing the muscles of the body, and especially those of the stomach.

The operations of rowing from a fixed, or from a sliding seat, are very much the same. In the latter case, the stroke is taken by extending the arms to their full length, and swinging the body forward, simultaneously, with the assistance of the foot straps on the stretcher, the knees being kept slightly apart and the back straight. When the oar is dipped at the beginning of the stroke, the knees are straightened out gradually, and the body thrown backward, simultaneously, so that at the finish of the stroke, the legs are straight and the body and shoulders thrown well back. The recovery is effected by bringing the body to the upright position by the action of the hips, and then the motions described above are repeated in taking another stroke.

FIG. 3.—Position finishing of stroke.

rectly over the stretcher. At this instant, the hands are raised and the blade is dropped firmly into the water and buried until it is covered up to the shoulder. The stroke is pulled through by bracing the muscles of the back, loins, and shoulders, and by swinging the body backward, with the feet pressing hard against the stretcher, and the arms held perfectly rigid. The weight of the body is thus transferred from the seat to the stretcher and the handle of the oar, and when the body, in swinging backward, has reached a perpendicular position, the oar handle is pulled back home to the chest until the

FIG. 5.—A common but very bad position. (Beginning of stroke.)

The motion of the body should be as constant and steady as that of a pendulum, while the action of the hands and the wrists, producing the dipping and the feathering, should be entirely free from jerks. When the boat contains a number of oarsmen, each one keeps his eyes on the back of the oarsman opposite to him, and times his swing from it, or in other words "keeps eyes in the boat." In governing his blade it is generally understood that the blade should be kept square or perpendicular to the surface of the water, but in properly constructed boats the thowl is slightly inclined aft, so that the blade is given a slight inclination forward, and presses against the water at an angle a little off the perpendicular. This obviates any tendency to row deep. On the other hand, if the thowl is inclined too much, the blade will have a tendency to fly out of the water.

A boat is "held" or has its headway stopped, by laying the blade flat and then sinking its forward edge slightly into the water. The blade is thus buried at an acute angle and checks the way of the boat gradually until it has been sufficiently reduced to allow of the blade being reversed square, to "back water." If the boat is under much headway, any attempt to back water before it has been held, would be attended with disastrous results, as the resistance would prove greater than the strength

FIG. 4.—The "Recovery." (Position of the hands and wrists in the act of feathering.)

knuckles almost touch the bottom of the breast bone, by the action of the shoulders and a gradual bending of the elbow joints, while the forearms are kept as nearly as possible in a horizontal position.

At the finish of the stroke, the whole strength of the arms and shoulders is exerted, but care is taken not to use the biceps, which if exerted, would tend to raise the arms and consequently bury the blade. At this point, the body is not allowed to "wait," but is continued to swing back until it is overtaken by the hands. When the hands reach the breast bone, they are dropped quickly about two inches so as to lift the blade out of the water, then turned back-

## ROWLAND—ROWTON HEATH

of the oarman and make him catch a "crab" and throw him flat on his back, if it did not cause a fracture of the oar.

In sculling, a scull or oar is held in each hand, instead of one oar handle being held in both hands, as in rowing. The grip on the scull is governed by the rules applicable to the grip on the oar handle in rowing, but with the exception that, the thumb should cap the butt of the scull handle with the top joint and not clasp around it. The action of the body, legs, arms, wrists and hands, are also the same as in rowing, but, in sculling some advantage may be gained by allowing the body to swing farther back at the finish of each stroke. Both hands should work together, and both blades should enter and leave the water at the same time. It is obvious that if one hand lags behind the other in any one of these movements, the resulting uneven strokes would deflect the boat from a straight course.

W. MORRY, JR.,  
Consulting Engineer.

**Rowland, rô'land, Henry Augustus**, American scientist: b. Honesdale, Pa., 27 Nov. 1848; d. Baltimore, Md., 16 April 1901. He was graduated from the Rensselaer Polytechnic Institute in 1870, and taught for a year in Wooster College, Ohio, but in 1872 returned to the Institute, where he was instructor in physics, becoming assistant professor in 1874. He studied for a time in Germany, and in 1876 accepted the chair of physics at Johns Hopkins University, which he occupied until his death. He was a member of the Electrical Commission in Paris in 1881, and was elected to the National Academy of Science in that year. He was the inventor of a greatly improved process of ruling large diffraction gratings directly on concave mirrors, constituting what is known as the dividing engine (q.v.), with which he succeeded in making photographs far superior to any which had then been made. He made numerous valuable investigations and experiments, particularly in electricity, among them an extremely accurate determination of the ohm, a work which he afterward extended under the government. He was author of more than 100 scientific papers and monographs, among which are: 'Magnetic Permeability' (1873); 'Magnetic Effect of Electric Connection' (1876); 'Research on the Absolute Unit of Electrical Resistance' (1878); 'On the Mechanical Equivalent of Heat' (1880); 'Photographs of the Normal Solar Spectrum' (seven plates, 1886); etc.

**Rowlandson, rô'land-sôn, Mary White**, American captive among the Indians. She was carried away by the Indians on the occasion of an attack on Lancaster, Mass., 10 Feb. 1675, during King Philip's war. For a time she was kept in an Indian village near the site of Petersham, Worcester County, and later was taken by her captors across the Connecticut, and after about three months was redeemed. Her 'True History' of her captivity and restoration was printed at Cambridge, New England, and in London, in 1682. A fifth edition was prepared by Joseph Willard (1828). The work, though not always clear as to detail, is interesting, and throws a graphic sidelight on Indian existence with its cruelty and squalor.

**Rowlandson, Thomas**, English artist: b. London July 1756; d. there 22 April 1827. He

was sent at 15 to Paris, and there studied art and gained a taste for pleasures of the town. The £7,000 left him by a French aunt he gambled away, yet he hated debt, and maintained his uprightness of character. He traveled over England and Wales, and enjoyed life to the full in his tavern and the company of friends like Morland, Gilray, and Bunbury. Rowlandson possessed rare dexterity of touch and fertility of imagination; and, though not seldom vulgar, he was never feeble. He was a relentless hater of Napoleon, belittling his greatness by countless travesties. Some of his best known works are his 'Imitations of Modern Drawings' (1784-8), and his illustrations to 'Syntax's Three Tours,' the 'Dance of Death,' Sterne's 'Sentimental Journey,' 'Peter Pindar,' the 'Bath Guide,' 'Munchausen,' etc.

**Rowson, rô'sôn, Susanna Haswell**, American actress and author: b. Portsmouth, England, 1762; d. Boston 2 March 1824. Her first work, the novel, 'Victoria,' appeared in England in 1786, and in 1792 she made her stage debut at Edinburgh. In 1793-6 she acted in the United States, closing at Boston with a comedy by herself, 'Americans in England.' From 1797 until her retirement in 1822 she conducted with much success a seminary for young ladies, first at Boston, and from 1800 at Medford. Her most popular work was 'Charlotte Temple, or a Tale of Truth' (1790), which had in its time wide sale, but is called by Wendell a "comically extravagant example" of a literary manner then much in favor. Further she wrote, among several volumes: 'The Inquisitor' (1788); 'The Volunteers' (1793); 'Miscellaneous Poems' (1804). There is a memoir by Nason (1870).

**Rowton, row'tôn, Montagu William Lowry-Corry**, 1st BARON OF, English lawyer and philanthropist: b. 8 Oct. 1838; d. London 9 Nov. 1903. He was educated at Trinity College, Cambridge, became a barrister in 1863, and entered upon a successful career as a lawyer. He was secretary to the Earl of Beaconsfield in 1866-8 and in 1874-80, and was secretary of the special embassy sent to the Berlin congress in 1878. He was created a baron in 1880. He established the Rowton lodging houses in London some three years before the Mills Hotels were instituted in New York. They were built with the idea of furnishing decent and comfortable lodgings for workmen and furnishing them also with well-cooked and substantial food at very moderate rates, yet at the same time with the intention of keeping the enterprise on a paying basis. He was chairman of the Rowton Houses and of the Guinness Trust until his death.

**Rowton Heath**, England, a place near Chester, which was the scene of a battle 24 Sept. 1645, in which the Parliamentary forces defeated the Royalists. After the crushing disaster of Naseby, King Charles I. fled to Wales, and next formed the desperate project of marching north to Montrose. Chester was then being besieged by Sir William Brereton, but the king succeeded in finding an entrance, and charged Sir Marmaduke Langdale to raise the siege. The Parliamentarians had just been reinforced by Poyntz's Yorkshire horse when Sir Marmaduke attacked them. He was utterly defeated, with

## ROXBURY—ROYAL GEORGE

a loss of 300 killed and 1,000 prisoners, and the disaster, added to Philiphaugh, stripped the unhappy king of his last hope.

**Roxbury**, rôks'bûr-î, Mass., now a part of the city of Boston, annexed in 1867. It has a diversified surface, a remarkable alternation of hills and hollows, which furnish opportunities for picturesque building sites, and which has made a great portion of Roxbury a residential section. There are a number of manufactories, among which are cotton and woolen mills, machine shops, cordage factories, carpet factories, and organ works. A free Latin school was established in Roxbury in 1645. The place was for many years the scene of the labors of John Eliot (q.v.), the "Apostle of the Indians," and his remains are in the "ministers' tomb" in the old burial ground. It is also the birthplace of Joseph Warren (q.v.) of Revolutionary fame. The township of West Roxbury, which contained the villages of West Roxbury and Jamaica Plain, was set off from Roxbury in 1852. When Roxbury was annexed to Boston it had a population of about 40,000.

**Royal Academy of Arts, The.** See **ACADEMY OF ARTS, THE ROYAL.**

**Royal Academy of Music, London, England**, an institution established in 1823, mainly through the exertions of Lord Burghersh (afterward Earl of Westmoreland), and incorporated by royal charter in 1830. The purpose for which it was founded was to afford a first-class musical education in the various branches of music, and to properly equip those who make music a profession. It receives a grant from the government, and from this and other sources is able to award to successful competitors a large number of scholarships and prizes. Instruction is given in musical composition, singing, and instrumental playing. Concerts are given at intervals by the pupils. Connected with the R.A.M. are associates, fellows, and licentiates, besides honorary members. Among its principals have been Sir George Macfarren and Sir A. C. Mackenzie.

**Royal and Protestant Order of Saint John.** See **ORDERS, ROYAL.**

**Royal Arcanum, The**, the name of one of the largest and strongest of the fraternal and beneficial societies in the United States. It was first organized 23 June 1877 at Boston, Mass., by Dr. Darius Wilson and John Andrew Cummings. The original council in Boston had but nine members. Other councils were soon established in the same city, and the order spread rapidly throughout the New England States. It has since grown at a rapid rate, and there are councils in every State and in almost every city and town in the Union. The business of the order is conducted in Boston, where the society owns a substantial building, in which the supreme council meets. The society is governed through councils which are dominated by the supreme council or governing body. The membership qualifications are good health and character; and the age limit is embraced in the ages between 21 and 55. Benefit certificates are issued for \$1,500 and \$3,000, payable at the death of a member. Should a member desire to increase his insurance over the limit fixed by the society he can do so by making application for the in-

crease in the **Loyal Additional Benefit Association**, formed in 1889, practically within the **Royal Arcanum**, and incorporated in 1890 under the State laws of New Jersey.

The officers of the supreme council or governing body of the society consist of supreme regent, supreme vice-regent, supreme orator, sitting past supreme regent, supreme secretary, supreme treasurer, supreme auditor, supreme chaplain, supreme warden, supreme sentry, and legal adviser. The grand councils and subordinate councils have a similar roster of officers.

The remarkable growth of membership in the **Royal Arcanum** is evidenced by the following official figures:

|           | Membership | Grand Councils | Subordinate Councils |
|-----------|------------|----------------|----------------------|
| 1898..... | 198,573    | 22             | 1,763                |
| 1902..... | 249,644    | 27             | 2,004                |
| 1903..... | 258,746    | 28             | 2,045                |

For the same period the total number of deaths in the order and the total amount of benefits paid were as follows:

|                                  | Number of Deaths | Amounts Paid |
|----------------------------------|------------------|--------------|
| 1898.....                        | 16,479           | \$47,886,199 |
| 1902.....                        | 25,714           | 73,817,676   |
| 1903.....                        | 27,480           | 76,190,358   |
| Emergency fund 31 Oct. 1902..... |                  | \$1,813,747  |
| Emergency fund 28 Feb. 1903..... |                  | \$1,885,786  |

The emblem of the association is a royal crown within a circle, on the circumference of which are 10 small Maltese crosses with the motto, "Virtue, Mercy, and Charity."

**Royal Arch Masons.** See **MASONIC FRATERNITY.**

**Royal College of Music, London, England**, an institution established in 1883 in South Kensington under the presidency of the Prince of Wales, afterward Edward VII. It was endowed at its commencement by gifts to the amount of \$630,000. Pupils of either sex are admitted either as fee-paying students or as scholars or exhibitioners. There are 52 open free scholarships and 11 close free scholarships, besides the council exhibitions, the Savage Club exhibition, the exhibitions of the associated board of the Royal Academy of Music (q.v.) and the Royal College of Music, etc. Prizes and medals are also awarded to the students in accordance with the results of examinations. The associateship may be obtained by outsiders as well as pupils on passing a qualifying examination, and entitles the holders to use the initials A.R.C.M. The professorial staff includes several eminent names.

**Royal Crown of Hawaii, Order of.** See **ORDERS, ROYAL.**

**Royal Family, The**, in its widest sense, as referring to Great Britain, embraces all the British descendants of the royal house; in its narrower sense it includes only the queen-consort and queen-dowager, with all the lineal descendants of the sovereign. The husband of a queen-regnant is not as such a member of the royal family. The members of the royal family have precedence before all peers and officers of state; but an heir-presumptive has no rank or precedence as such, as his position may be altered by the birth of an heir-apparent.

**Royal Fern.** See **OSMUNDA.**

**Royal George**, English man-of-war, sunk in Portsmouth harbor, England, 29 Aug. 1782.

## ROYAL GEOGRAPHICAL SOCIETY—ROYAL

While undergoing repairs at the keel the vessel suddenly careened and filled with water, going down with all on board. The ship, the principal vessel of Lord Howe's fleet, was commanded by Admiral Kempenfeldt, and carried about 1,100 persons, including nearly 300 women and children. The disaster was commemorated in an elegy by Cowper, 'The Loss of the Royal George.' The first attempt to raise the vessel was made in 1817; but it was not until 1839 that portions of the ship and its cargo were brought to the surface, when the sunken mass was exploded by means of great quantities of gunpowder.

**Royal Geographical Society.** See GEOGRAPHICAL SOCIETY, ROYAL.

**Royal Institution of Great Britain**, an institution founded in 1799 by Count Rumford, Sir Joseph Banks, and other men of science, and incorporated in 1800. It was reconstituted on a wider basis in 1810, and has for objects the promotion of scientific and literary research, the teaching of the principles of experimental science, the exhibition of the applications of these principles to the arts, and the affording of opportunities for study. Many distinguished chemists and physicists have conducted their researches in the laboratories. The library contains some 60,000 volumes.

**Royal Lion, Order of.** See ORDERS, ROYAL.

**Royal Louis Order, The.** See ORDERS, ROYAL.

**Royal Observatory, Greenwich**, the famous English observatory founded by Charles II. in 1675. The first observation was made 19 Sept. 1675. The director of the observatory is styled the astronomer royal, and is under the official control of the admiralty, but receives his appointment directly from the prime minister, and holds office by warrant under the royal sign manual. The largest instrument is a 28-inch refractor, with a spectroscope attached which has been recently mounted. Photographs of the sun are taken on every available day, and after being measured are carefully stored for reference. Magnetic and meteorological observations, made continuously, form an important branch of the works. The chronometers used in the English navy are purchased, and generally examined at the observatory. Hourly and daily time-signals are sent out from the observatory through the post-office telegraphs giving Greenwich time to all parts of the country.

**Royal Order of Victoria.** See ORDERS, ROYAL.

**Royal Orders.** See ORDERS (ROYAL) AND DECORATIONS OF HONOR.

**Royal Society of Edinburgh**, a society which was incorporated in 1783, having been developed from the Philosophical Society of Edinburgh, commenced in 1739. Among its early members were Hume, Reid, Edmund Burke, Hutton, Dugald Stewart, and James Watt; and among its presidents have been Sir Walter Scott, Sir David Brewster, the Duke of Argyll, Lord Moncrieff, and Sir William Thomson.

**Royal Society, London**, an organization which owes its origin to a club of learned men who were in the habit of holding weekly meet-

ings in London as early as 1645, but the year 1660 is generally given as the year of its foundation. Charles II. took much interest in the proceedings of the society, and in 1662 granted a charter to the "President, Council, and Fellows of the Royal Society of London for Improving Natural Knowledge." Lord Brouncker was first president of this incorporated Royal Society. Meetings are held weekly from November to June for the purpose of reading and discussing scientific papers; and the more important of these are published in the annual 'Philosophical Transactions,' first issued in 1665, and now forming a most valuable series. Accounts of the ordinary meetings, with abstracts of papers, etc., appear also in the periodical 'Proceedings,' begun in 1800. Scientific research has at all times been both initiated and encouraged by the Royal Society, and many of the most important scientific achievements and discoveries have been due to its enlightened methods. It deservedly enjoys an influential and semi-official position as the scientific adviser of the British government, and not only administers the \$20,000 annually voted by parliament for scientific purposes, but has given suggestions and advice which have borne valuable fruit, from the voyage of Captain Cook in the Endeavour in 1768 down to the Challenger expedition, more than a century later. The society has an independent income.

**Royal University of Ireland**, an examining institution with its seat at Earlsfort Terrace, Dublin. It was founded in 1880 in pursuance of the provisions of the University Education (Ireland) Act, 1879, to take the place of the Queen's University, a similar institution established in connection with the Queen's Colleges (q.v.). The Royal University corporation consists of a chancellor, a senate, and graduates, the government being vested in the chancellor and senators, the latter not to exceed 36 in number. It has power to confer all such degrees and distinctions as are conferred by any university in the United Kingdom except in theology; these may be bestowed on all male and female students who have matriculated in the university and passed the prescribed examinations, no residence in any college or attendance at any course of instruction in the university being obligatory on any candidate for a degree other than a degree in medicine or surgery, the university in this respect resembling that of London. An act of 1881 provided for the payment of \$100,000 a year out of the surplus funds of the Irish Church for the purposes of the university. The university has a considerable staff of examiners, but no professors. A certain number of exhibitions and scholarships are conferred on those who pass examinations with high distinction.

**Royall, roi'al, Isaac**, American soldier: b. Massachusetts about 1720; d. England October 1781. He was a wealthy citizen of Medford, was its representative for many years in the general court, and for 21 years was a member of the executive council. He served in the French war, and in 1761 was appointed brigadier-general, the first resident of New England to attain that rank. At the outbreak of the American Revolution he remained loyal to the crown, and in 1775 left the country. His estates were confiscated and he was proscribed in 1778, but seems to have borne no enmity to his native land.

## ROYCE—RUBBER MANUFACTURES

as he bequeathed 2,000 acres of land in Worcester County to found a law professorship at Harvard, and made various other patriotic bequests. The town of Royalston, of which he was one of the original proprietors, was named in his honor, and the chair of law was established in his name at Harvard in 1815.

**Royce, rois, Josiah**, American philosopher and educator: b. Grass Valley, Nevada County, Cal., 20 Nov. 1855. Graduated (1875) from the University of California, he studied also at Leipsic and Göttingen (1876) and the Johns Hopkins University (1877-8), and in 1878-82 was instructor in English in the University of California. From 1882 to 1885 he was instructor in philosophy at Harvard, in 1885 was appointed assistant professor, and in 1892 was elected to the professorship of the history of philosophy, which he still retains. His views are very similar to those of T. H. Green (q.v.), the great English representative of the Neo-Kantian or Neo-Hegelian movement, and his position may be studied in the historico-critical work, 'The Spirit of Modern Philosophy' (1892). His clear, distinguished style as writer and lecturer has served to enhance his reputation in the United States, among whose leaders in philosophic inquiry he is highly ranked. Besides 'California from the Conquest to the Vigilance Committee of 1856' (1886), and 'The Feud of Oakfield Creek' (1887), a work of fiction, he has written: 'A Primer of Logical Analysis' (1881); 'The Religious Aspect of Philosophy' (1885); 'The Conception of God' (1897); 'Studies of Good and Evil' (1898); 'The Conception of Immortality' (1900; Ingersoll lecture on immortality, 1899); 'The World and the Individual' (1900-1; Gifford lectures, 1899-1900); 'Outlines of Psychology' (1903).

**Roycrofters, roi'krōf-tērz**, The, the name applied to a colony of artisans and artists living at East Aurora, Erie County, N. Y. The founder of the Roycroft colony was Elbert Hubbard (q.v.), who in 1893 established here a printing establishment and a monthly periodical called 'The Philistine.' Hubbard, imbued with a socialistic doctrine similar to that of William Morris (q.v.) of England, gradually gathered about him numerous kindred spirits, and since 1900 the Roycrofters have been producing handmade books, furniture, and wrought-iron work, and have established schools of music, painting, and sculpture. There are numerous workshops, a library, church and other buildings at East Aurora, occupied by the Roycrofters, who have increased in number until the colony numbers several hundred.

**Royer-Collard, rwā-yā-kō-lār**, Pierre-Paul, French statesman and philosopher: b. Sompuis, Marne, 21 June 1763; d. Chateaufieux 4 Sept. 1845. He was educated at the colleges of Chaumont and Saint Omer, and later became an advocate in Paris. He was an active participant in the pre-Revolutionary movement, and was elected one of the representatives of the commune of Paris. During the ascendancy of the Jacobins he retired to his native province, where he succeeded in avoiding their suspicions. In 1797 the department of Marne sent him to Paris as a member of the Council of the Five Hundred, and there he endeavored to serve the republic. But his sympathies were not with the Napoleonic

regime. His correspondence with Louis XVIII began at this period, which was also marked by his temporary retirement from political life. In 1809 he was appointed to the chair of philosophy in the University of France, and later became known as the head of the "doctrinaire" school. At the Bourbon restoration in 1814 he was made councillor of state, and chief of public instruction. In 1827 he was admitted to the French Academy, and in 1828 became president of the chamber of deputies. In 1842 he retired from public life. He left few published works, but these reveal him as at all times on the side of freedom and enlightenment. In the support of the house of Bourbon he sought the overthrow of an empire which seemed to him to have usurped greater privileges than those of the monarchy it supplanted. His biography has been written by Barante (1876), Spuller (1895), and Vingtain (1858). For an outline of his philosophy, consult Jouffroy's translation of Reid.

**Roze, rôz, Marie**, French opera singer: b. Paris 2 March 1850. She was a favorite opera singer of Paris for many years. Her first appearance in London was in 1872. There she was received with favor also, and sang in Italian opera during the next four years. She was married to Mr. Mapleson, her manager, in 1897, and sang for two years in America, when she returned to the London operatic stage.

**Ruatan, roo-ā-tān', or Roatan, rô-ā-tān'**, an island of Central America, in the Bay of Honduras, is 30 miles long by 10 miles wide. Its coast has dangerous reefs, except at the south, where there are a few good roadsteads, and at the east, where there is one, called Port Royal, which is ample and deep, though difficult of access. The soil is fertile and the coconuts, palm, figs, and vines grow spontaneously, while all vegetable growth is abundant. Ruatan has three dependencies, Bonaca, Utiia, and Barbareta, comprising the colony of the Bay Islands. These islands were ceded to Honduras in 1856 by Great Britain. Pop. from 2,000 to 4,000.

**Rubaiyat, roo'bāi-yāt**, a Persian word, the plural of *rubai*, signifying quatrain or epigram. Various forms of the *rubai* were borrowed from the Arabic, and one specific form was invented by Abul Khair of Mahna. It is this style of *rubai*, affording the most concise expression to views of religion and philosophy, that was developed by Omar Khayyam (q.v.), a selection of whose quatrains, translated into English by Edward Fitzgerald (q.v.), became so widely known as popularly to be called 'The Rubaiyat.'

**Rubber**. See INDIA RUBBER.

**Rubber Manufactures, American**. The rubber industry in the United States began with the discovery of the process of vulcanization in 1840. It had been used by the South American natives before the discovery of America. It was not until 1770, however, that rubber was utilized in any civilized country; then a few pieces of it were sent to England to be used by artists for erasing pencil-marks. The first rubber imported into this country, in 1800, came in the form of bottles, and was looked upon simply as an interesting curiosity. During the next 30 years sea-captains coming from South American countries were constantly bringing with them specimens of "gum elastic," as it was then more generally

## RUBBER MANUFACTURES

called, simply as the strange product of a distant land. In 1813 a patent was granted Jacob Hummel, of Philadelphia, for a gum-elastic varnish, of which there seems to be no further mention. Some 10 years later, in 1823, a Boston sea-captain, coming from South American ports, brought with him a pair of rubber shoes which excited the greatest interest. In 1825 500 pairs of rubber shoes, made by the natives along the Amazon, were brought into Boston; they were thick, clumsy, and unshapely, but they sold readily, at \$3 to \$5 per pair; for, with all their heaviness and awkwardness, it was found that they were a secure protection against dampness. During the next 15 years probably over 1,000,000 pairs of these shoes were brought into this country and sold at these very considerable figures.

In 1831 it was discovered that by dissolving the crude rubber in spirits of turpentine and adding a quantity of lampblack there could be obtained a varnish which, when spread over leather or cloth, gave a hard, smooth, impervious surface. The Roxbury India-Rubber Company was organized and received its charter in 1833. Its business was prosperous, but was actually doomed to speedy failure as the preparation used was not durable, melting and sticking in summer and cracking in winter. Charles Goodyear, a bankrupt hardware merchant of Philadelphia, became interested in the method, and learning of its imperfection set himself to remedy the fault. By 1836 the Roxbury Company had ignominiously failed. After six years of experiment, in 1838 Goodyear found a solution of the difficulty. The story goes that as he was sitting by the kitchen stove despatching on the possibilities of rubber, he struck a handful of rubber and sulphur against the hot stove, thus accidentally discovering the secret of vulcanization.

In 1840 he secured the assistance of two New York capitalists and built a factory in Springfield, Mass. Here, four years later, he took out a patent for preparing rubber by the process of vulcanization, and began to sell licenses for the manufacture of various articles under this patent. The license to manufacture rubber boots and shoes was sold to Leverett Candee, of New Haven, the founder of L. Candee & Co., a company which has continued to the present time an important factor in the American rubber footwear industry. The license to manufacture rubber gloves he granted to the Goodyear's India-Rubber Glove Manufacturing Company, of Naugatuck, Conn. The license to manufacture door-springs, which seemed a very trivial branch of the industry, but which later grew to considerable proportions, was granted to Daniel Hodgman, of New York; and various other licenses were given out to different companies. All branches of the rubber business as we find it in this country to-day took their permanent rise from the date of Goodyear's patent. Mechanical goods, and especially belting, began at this time to receive considerable attention. Some rubber garments were also made. An immediate demand for the poncho—a blanket for horsemen, with a hole in the centre for the rider's head—came from the far Southwest and from Mexico; and various druggists' sundries also began to find their way into the market. With the discovery of hard rubber the field of rubber's usefulness was still further largely extended. But the importations of crude rubber

at Salem, Mass., to which port the greater part of the rubber then imported was brought, amounted in 1851 only to 334,000 pounds, in 1852 to 1,961,000 pounds, and in 1854 to 2,055,000 pounds.

The Civil War gave a great impetus to the rubber industry, notably to the clothing branch; blankets were needed for the soldiers, and the government gave out large contracts. The boot and shoe industry increased rapidly with the other branches of rubber manufacture, so that, from an output in 1860 of the value of \$795,000, the yearly output in 1870 had increased to \$8,000,000. The manufacture of mechanical goods took a rapid start shortly after the War. This was owing to a considerable extent to the great increase of railroad building at that time. The railroads called for large quantities of packing, and for hose to be used in conveying steam and gas. The impetus given to manufacturing in general made an increased demand for rubber belting. The first rubber belt was patented in this country in 1836, but this particular branch of the rubber industry reached no considerable size until after the War, when rubber belting was in demand for mills, factories, and elevators, and especially for all outdoor machinery. It possessed several advantages over leather belting: its lower price, the greater friction between the belt and the wheel, and the fact that it was not affected by exposure or by moisture. The making of rubber tires began in 1877, with the solid tire, which gave way to the cushion tire. It in a short time and in a less degree was displaced by the pneumatic tire. It is estimated that at least 3,000,000 pounds of rubber are now annually used in the making of bicycle tires, and twice as much more for tires for carriages, wagons, and automobiles. Next in importance to rubber tiring, which stands next to hose, belting, and packing, comes the making of rubber mats. This industry has enjoyed a constant and rapid growth, until we have mats for floors and for stairs, pitcher-mats for tables, and coin-mats for counters—and all in an infinite variety of design. Rubber tiles, which have recently come into use, are desirable not only because of their cleanliness and durability, but for their noiselessness. The introduction and rapid growth of the typewriter industry has consumed a constantly increasing quantity of rubbers in various details of typewriter construction. Several hundred thousand pounds of rubber are used each year by one company alone in the manufacture of rings for preserving jars. The making of pencil erasers consumes a large quantity, and there is a large annual output of goring, in which rubber thread is used. A quarter of a million dollars' worth of rubber is used in this country each year in the making of cushions for billiard-tables. Other important items are rubber stamps, tennis balls, footballs, golf-balls, etc. There are now about 40 companies making rubber mechanical goods, with an aggregate capital of about \$30,000,000, employing 10,000 men, and having an annual output valued at from \$35,000,000 to \$40,000,000. Our export trade in mechanical goods amounts to about \$2,000,000 a year.

The attempt to utilize the waterproof properties of the caoutchouc gum in the manufacture of clothing was one of the earliest directions which rubber invention took, especially in Eng-

## RUBBER MANUFACTURES

land. In this country very little was done in this department of rubber manufacture until the Civil War, and the great demand to which it gave rise for rubber coats and blankets. After the War rubber coats continued to be made, but they were chiefly of a heavy sort and almost solely for men. For women's use the light gossamer came out about 1875. But excessive competition resulted in such deterioration of quality as seriously to affect its popularity. About 1885 the manufacture of mackintoshes for both men and women was started in this country. About 20 factories, with a capital of more than \$6,000,000, manufacture mackintoshes. Another important branch of the rubber industry in the United States is the making of druggists' sundries. The pioneer in this industry was the Union Rubber Company, located in Harlem. It derived its license direct from Goodyear, and began to manufacture druggists' sundries in 1857, making syringes, water-bottles, bandages, air-pillows, and air-cushions. The atomizer was a later development, and came into vogue in 1880. There are some 10 companies engaged in this branch of the business in this country at the present time, with a capital of between \$4,000,000 and \$5,000,000, and with an annual output of about \$4,000,000. After Goodyear had brought his vulcanization process to a fair degree of perfection he turned his attention to the making of hard rubber, in which he was greatly assisted by his brother Nelson, who in the year 1851 obtained a patent for the production of hard rubber. Hard rubber differs from soft rubber in containing a much larger proportion of sulphur, and in the degree of heat used in vulcanization, which is considerably higher than that at which soft rubber is vulcanized. The first article made in hard rubber to any considerable extent was the comb. It is said that Goodyear's experiments in this line made his combs cost twenty times as much as the ivory combs then in use; but the rubber comb has now practically displaced all other kinds. For twenty years after the invention of hard rubber the India-Rubber Comb Company practically enjoyed its monopoly; but other companies entered the field after the expiration of the Goodyear patent. In 1898 the American Hard Rubber Company, with a capital of \$2,500,000, was formed, and absorbed the various individual companies engaged in this line of manufacture. The annual output of hard rubber goods is in the neighborhood of \$3,000,000, and about 2,500 operatives are employed in this branch of the rubber trade. The principal articles of manufacture are electrical appliances, combs, syringes and syringe fittings, fittings for pipes, buttons, harness trimmings, and various desk articles, such as ink-wells, penholders, and rulers. It is the boot and shoe industry, however, that has led in rubber manufacture in this country from the very first. For many years it used the great bulk of the rubber imported into this country, but the later development of other branches of the rubber business has been so large that now the boot and shoe industry comprises probably not over 40 per cent of the rubber manufactured in the United States. From an annual output in 1860 of the value of \$795,000, the value of the rubber boot and shoe product grew in 1870 to \$8,000,000, in 1880 to \$16,000,000, in 1890 to \$24,000,000, and in 1900 to \$40,000,000. There are now a dozen or more

large factories engaged in the manufacture of rubber boots and shoes. Their combined daily capacity is over 180,000 pairs of boots and shoes; they employ 17,000 workmen, and their aggregate capital is \$50,000,000. Their aggregate output for 1900 was 40,000,000 pairs of boots and shoes. We have as yet done comparatively little in the way of exporting rubber boots and shoes, our annual exports in this line rarely exceeding \$1,000,000. The reason has been chiefly that the American demand has been so large and has so constantly increased that our manufacturers have not yet felt the necessity of looking for a broader field. They have consequently made no effort to appeal to foreign buyers by making rubbers particularly suited to their local conditions. The rubbers which we export go chiefly to England, the Continent, Japan, and China. A very important event in the history of the rubber boot and shoe industry in the United States occurred in the fall of 1892, when the United States Rubber Company purchased nearly all of the large footwear interests in the United States. This centralization of the rubber industry has already resulted in conspicuous economies; for while the different factories have remained under their former individual management, they have shared their individual advantages in common, the patents and secret processes of one factory becoming the property of all. In this way all the improved methods, a part of which each factory enjoyed before, are now shared equally and fully by all the different factories. There has also been a great saving in the matter of purchasing crude rubber, a large single purchase being made at a great advantage over a number of smaller scattered purchases. In reducing the necessity of carrying large stocks, in diminishing the duplication of a vast number of expensive lasts, and in various other ways, marked economies have been effected, while at the same time the quality of the goods has been more uniformly excellent than heretofore. The combination of all that was best in the methods of the different companies has proved a potent agency in advancing the rubber footwear industry in this country toward the universal goal of all industrial enterprises—better product at a lower cost. The entire rubber industry in the United States, in its five branches, footwear, mechanical goods, clothing, druggists' sundries, and hard rubber, consumes considerably more than one half of the rubber manufactured in the world. The consumption of rubber in this country increased from 9,830,000 pounds in 1875 to 17,835,000 pounds in 1880, to 31,949,000 pounds in 1890, and to 50,000,000 pounds in 1900. To this large amount must be added the rubber which is obtained by the reclaiming process, which has now been brought to such a state of perfection that very little rubber goes to waste, old rubber articles being collected and subjected to a process which eliminates from the compound everything but the rubber. It is probable that the amount of this reclaimed rubber used annually in this country equals 40,000,000 pounds, making the total yearly consumption of rubber 90,000,000 pounds. The rubber industry in the United States in 1901 is 20 times what it was in 1860, five times what it was in 1870, and has trebled since 1880. There are \$100,000,000 of capital invested in the various branches of rubber manufacture in this country, and the value of the

## RUBBER-TREES

yearly product is fully \$100,000,000, while 200,000 people depend upon it for their support. See also INDIA RUBBER.

Rubber-trees, the sources of caoutchouc (q.v.) or india-rubber (q.v.) are botanically various and widely distributed in the warmer parts of the world. They belong to the four allied groups *Moraceæ*, *Euphorbiaceæ*, *Artocarpaceæ*, and *Apocynaceæ*, but not all the members of these families yield caoutchouc, while a similar juice may be obtained from certain outside plants, but not in commercial quantities. This substance (latex) is one of those, like the "milk" of the milkweeds, and many others, which are elaborated in the green surface cells and conducted through the plant, for its nourishment, by the lactiferous canals. In the rubber plants they run just beneath the bark, and often carry the sticky juice in excess, so that "in the gigantic trunks of tropical fig-trees," as Kerner says, "the latex often wells up in large quantities from rifts in the bark which have arisen spontaneously, and thickens into long strings and ropes of india-rubber hanging down like a mantle." A rough test of whether a tree-juice has the true properties of caoutchouc is to rub some of it between the fingers until it exhibits the recognized elastic threads; inferior juices of other trees are sometimes mingled with it by native gatherers, as adulterants, and these may in some cases nearly ruin the whole package, by developing other qualities in coagulation, as, for instance, those of gutta-percha (q.v.).

The caoutchouc-yielding trees occur in all tropical regions, but are different botanically in each region. The principal commercial supply and the best is obtained from the valley of the Amazon, and is known to the trade as Pará rubber; but all other parts of northern South America ship it in large quantities. That which comes from the valleys of the Amazon and Orinoco (Brazil, Guiana, and Venezuela) is chiefly the product of the euphorbiaceous genus *Hevea*, and especially of *H. brasiliensis*, a tree often 60 feet in height, branching from the base, which, with two or three similar species, grows abundantly in the hot, steaming lowlands along the river courses; the juice is obtained by tapping the trees, by means of incisions in the bark in the evening, and collecting the deposition next morning. Each tree will yield about six ounces in three days, and then must be allowed to rest. The main resources in Guiana are the species *H. guayensis* and *paucifolia*, the former of which is called by the natives "cahoutchou." That exported from Maranhão is similar. The Ceará rubber is derived from a smaller euphorbiaceous tree (*Manihot glaziovii*), which grows over a large area in that part of Brazil, and is tapped when about two years old. The Pernambuco or Mangabeira rubber is the product of a small, drooping tree (*Hancornia speciosa*) of the family *Apocynaceæ*, which grows on the hills and yields the edible fruit "mangaba," for the sake of which it is frequently cultivated in orchards. This is a comparatively poor sort of rubber. Nearly all of the crude rubber above mentioned is exported to Europe, the United States deriving its supply mainly from Colombia, Ecuador, Central America, and Mexico. This is mainly the product of a tree (*Castilleja elastica*) of the family *Artocarpaceæ*, related to the breadfruit.

It is a lofty tree, with a trunk three feet or more in diameter, and large, hairy, oblong leaves, which grows in the rich soil of wet, low-lying, heavily forested valleys. With some allied species it flourishes from Mexico and Cuba to the mountains of Venezuela and the Andes, which separate it from the heveas of Brazil. It reaches its best size and condition in Panama and Nicaragua, where an average tree is expected to yield 20 gallons of milk, or about 40 pounds of crude rubber. Honduras rubber is good, but that from Guatemala is inferior.

The Asiatic supply comes from various parts in Assam (via Calcutta), and eastward to Borneo, and is chiefly produced by the rubber-fig (*Ficus elastica*). The trees may be tapped when 25 years old, and for 50 years afterward will yield 40 pounds of caoutchouc every three years. A large variety of other plants and trees in the Malayan and Papuan region yield rubber, some of which is excellent and of growing importance commercially, and everywhere the early rough and wasteful methods of obtaining the product are being corrected. It is also obtained in northern Australia, in Fiji, and in various neighboring islands. More than 100 different trees are known to give rubber-making juices in commercial quantities, while in a great many others, as lettuce, poppy, milkweed, and others, it is present in small quantities. The juice of the Brazilian *Hevea* trees is said to yield about 30 per cent of pure rubber; but a product of less than 15 per cent is not regarded as commercially profitable.

Africa is now the principal source of the rubber supply of the world next to South America. The bulk of that from the west coast and equatorial region is obtained from various climbing shrubs belonging to or allied to the apocynaceous genus *Vacca*, few of which are well known to botanists. In Liberia and somewhat elsewhere are rubber-bearing figs; and a large part of the extensive product of Madagascar and the Mozambique coast is derived from a *Walbergia*, species of which also give much of the caoutchouc received from the Malayan Islands.

*Cultivation of Rubber Trees.*—Attempts have been made in most countries, where suitable conditions prevail, to propagate the rubber trees in plantations of prescribed dimensions, and capable of rational supervision by experts, rendering the planter independent of native delinquencies and assuring annual crops of first quality for an indefinite number of years. It has been demonstrated that the rubber tree can produce, under proper management, a regular and increasing crop, for each year of its natural life, without being injured. The experiment of re-stocking the former rubber forests of the southern states of Mexico is now being carried on by American capitalists with prospects of success. Many thousands of acres of rubber lands have been purchased from the Mexican government, and are rapidly being developed in plantations. Progress has been retarded on account of lack of previous knowledge or precedent in the business, yet the difficulties seem to have been surmounted, and it is now demonstrated that the rubber tree can be artificially cultivated when conditions under which its growth is stimulated are understood. In Chiapas, the numerous river-bottoms afford the character of soil acquired,

favorable atmospheric conditions, and abundance of rain-fall. Covered with thick tropical forest growth, which it is necessary to clear, the rubber tree shoots, raised from seed in neighboring nurseries and about a foot high, are planted in the clearings to the number of 200 trees to the acre. But little further care is required. At six years of age the tree is tapped, yielding a small first crop. Hundreds of thousands of every age, from one to four years, are growing in apparent strength and luxuriance, with a prospect of affording an ever increasing supply of the crude product annually. The Central American rubber-tree will not flourish in swamps, though moisture is a prime requisite. The altitude it affects varies in different lands, preferably but little above sea-level, but in some localities 1,000, 1,500, or even 3,000 feet above tide water. The rubber-plant so commonly grown as an ornamental house-plant is the East Indian fig (*Ficus elastica*).

**Rubble Work.** See MASONRY.

**Rubefaciens**, substances or agents which, when applied for some time to the skin, occasion a redness and increase of heat. When the irritant effect of any agent amounts to blistering, or causes discharge of pus or matter, the action is said to be vesicant or suppurative. All these agencies are included under the one term counter-irritants, the rubefacient action being the mildest of the three, and dependent generally upon the form and duration of the application; as, for instance, mustard or ammonia may be used so as to produce only the most transient redness, or may be made to cause blistering or suppuration. Among the most commonly used rubefaciens are hot water, ammonia, mustard, oil of turpentine, powdered ginger, spirit of wine, camphor, and chloroform vapor.

**Rubellite**, the red or deep pink variety of tourmaline (q.v.); when transparent, valued as a gem.

**Rubens**, roo'bénz, Peter Paul, Flemish painter: b. Siegen, western Germany, 29 June 1577; d. Antwerp 30 May 1640. He was the son of a person of good citizen family who had gone from Antwerp to Cologne on account of religious oppression, and who, while there, had become the steward of Anne, wife of William of Orange-Nassau, the famous liberator of the United Provinces. He was compelled to remove to Siegen, a small town, because of offenses committed, and it was not until his death in 1588 that the widow was able to return to Antwerp. There the boy studied in the Jesuit College and was page to a lady of rank. He studied art first with Tobias van der Haegt, and afterward with Adam van Noort, but his chief master was Otto van Veen (called Otto Vaeuicus). With this artist, who was court painter to the Regent of the Netherlands under Spain, the Infanta Isabella Clara Eugenia, Rubens remained from 1596 to 1600; and at the end of that period of time went to Italy. It is evident that he had the best introductions; and yet the young man's courteous manners and liberal training, as well as his great ability as a painter of portraits, must have made him welcome at once.

At Venice he met the famous and magnificent Duke of Mantua, Vincenzo Gonzaga, who at once employed him, sending him first to Rome, placing him near his own person at his own pal-

ace in Mantua, and sending him to Spain in 1603. While in Mantua he painted the famous triple altar-piece for the Prince's chapel; a work of which the greater part of the middle composition is in the Church of Saint Trinità in Mantua, one wing at Nancy in the Provincial Museum, and one at Antwerp. It was not until 1608 that he returned to the North, finding his mother dead on his arrival; and settled in Antwerp, his home from that time. It was then that he painted the first of the two wonderful pictures which are in the Cathedral of Antwerp, the 'Raising of the Cross'; and two years later, for the Company of the Arquebusiers, its companion, the famous 'Descent from the Cross,' which is in itself a perfect embodiment of Rubens' art. He married, and now having property, both from his own inheritance and labor, and in right of his wife, bought land and built himself a house, of which drawings remain and in which he lived for 30 years in the fashion of a very wealthy burgher; though having, through the practice of his art, unusually close relations with the Infanta's court and the nobility, both Spanish and Flemish. It was in this capacity that he went to Spain on a mission for his patroness, the regent of the Netherlands, and her husband, the Archduke Albert of Austria, and was sent from Spain to England by the famous minister, Olivares. It is not to be forgotten that he was looked upon as a subject of the Spanish monarchy, and that in his capacity as a good Catholic he would have felt no objection to this view of the case, though he never took sides strongly against the Protestant rising of many of his countrymen. In England he was knighted by King Charles I. Finally in 1630, being then in his 54th year, he returned to Antwerp and married a second time. From this time onward his art employed him almost incessantly, in spite of a short intervention due to religious divisions between the northern and southern provinces; and his fame and popularity increased until his death in 1640 in Antwerp.

Few artists have had so varied a career, with so many other subjects of high interest to interfere with the peaceful pursuit of their art; and yet few artists have approached Rubens in the amount of artistic work done. This is to be accounted for in part by his extraordinary skill and success in assimilating the work of his many assistants (their names are those of men afterward famous in their art, chief among them Jordaens and Van Dyck); but partly also by the almost unexampled facility of work which he gained and which remains unique in the records of the art of painting. In his earlier days he copied great numbers of paintings by Italian masters, as was the custom then, and there can be no doubt that his facility and range were greatly increased by this practice. His work done after the age of 30 is uniformly wonderful for his power over all his materials, and all the different processes which enter into painting on a large scale. The fresh and rosy scheme of color which he adopted must have been natural to his instincts; original with him and not derived; moreover, his strong and intelligent drawing, though gained by practice in many schools, was still his own creation. His tendency to excess of action and to the appearance of violence, as

## RUBICON — RUBRIC

in the famous 'Fall of the Rebel Angels,' in Munich, and many similar works, does not seem to imply a headlong or self-forgetful mood; he seems to have been always master of himself, and his paintings were always popular (that is, in sympathy with his times), in style and management. He became in this way the typical artist of his epoch and the most admired master, the man chosen for great state undertakings in art as well as in diplomacy. It was in this capacity that he was employed by the Queen Dowager of France, widow of Henry IV., to decorate her palace of the Luxembourg in Paris, and the great paintings which are now in the new Hall of Rubens in the Louvre were prepared for that purpose. Studies for them are at Munich.

All the treatises on Flemish painting deal with Rubens, and the dictionaries of artists give him much space. The most important book devoted to him is that by Emile Michel, translated into English as 'Rubens, his Life, his Work, and his Time' (London 1899). This book is very richly illustrated. The collections of artists' biographies do not always contain Rubens' biography; but an excellent life of him by Charles W. Kett is included in the series called 'Illustrated Biographies of Great Artists' (1878-9). There are many books published in Belgium, either in French or in Flemish, which deal with the different stages in his remarkable career, and some of these are readily accessible. The essay on Rubens in 'Great Masters' by John La Farge (New York, 1904) is of great critical value. The 'Gazette des Beaux-Arts' has several important papers with elaborate illustrations.

RUSSELL STURGIS.

**Rubicon**, roo'bi-kón, a river in Italy, of some celebrity in Roman history, Caesar having by crossing this stream, at that time regarded as the northern boundary of Italy, finally committed himself to the civil war. Hence the phrase, "to pass the Rubicon," is to take the decisive step by which one commits himself to a hazardous enterprise. It is very doubtful under what modern name the Rubicon now exists, the honor being claimed by two streams—the Fiumicino and the Lamo.

**Rubidium**, a rare metal discovered by Bunsen and Kirchhoff in 1860, by means of spectral analysis, in the residue obtained by evaporating a large quantity of the mineral water of Dürkheim, Germany. The metal and its salts exhibit two dark red lines in the blue part of the spectrum—hence the name, from the Latin *rubidus*, "dark red." Rubidium has the atomic weight 85.4, and the symbol Rb. It is a white, shining metal, having a specific gravity of 1.53; at ordinary temperatures—even so low, indeed, as  $-10^{\circ}$  C.—it is soft as wax; it is easily oxidized; when thrown on water it decomposes that liquid with evolution of hydrogen, which takes fire because of the heat produced in the reaction. Rubidium forms one of the metals of the alkalies, being analogous in its properties with potassium and sodium; its compounds also closely resemble those of these metals; thus it forms a characteristic hydrate (RbHO), which is a white, solid substance, feeling unctuous to the touch, deliquescent in the air, and dissolving in water to form a strongly alkaline liquid. Rubidium forms one chloride (RbCl), bromide

(RbBr), and iodide (RbI), and in all its compounds comport itself in a manner precisely analogous with potassium and sodium.

**Rubinstein**, roo'bin-stín, Anton Gregor, Russian composer and pianist: b. Wechwotynetz 30 Nov. 1830; d. 20 Nov. 1894. His parents were Jewish and soon after his birth removed to Moscow. His mother, being a good musician, was his first teacher; he next studied with Villoing, a Frenchman, and at nine played in a concert at Moscow. He accompanied his teacher to Paris, where in 1840 he played before the most distinguished musicians. He was advised by Liszt to study in Germany and after a concert tour in England, Holland and elsewhere, he settled in Berlin to study theory under Dehn. He returned to Russia in 1848 settling in Saint Petersburg. In 1855 he was enabled to visit Germany again for study; here also he succeeded in finding publishers for his compositions, and made concert tours that extended to London and Paris. In 1858 he was again in Saint Petersburg, where he was appointed court pianist; in 1859 he became director of the Russian Music Society and in 1862 founded the Saint Petersburg Conservatory, and was director until 1867. He made concert tours in Europe in the following years and appeared in America in 1872-3. As a piano player he occupied the front rank; in perfection of technique he had few peers and was excelled by none. As a composer he was prolific, brilliant; but showed a lack of self-discipline which prevented his compositions from attaining the highest merit. He wrote operas, pianoforte pieces, orchestral scores and songs; his best known works being the Ocean Symphony and the pianoforte concertos in G major and D minor and the trio in B-flat. His operas, such as 'The Maccabees' (1875); 'Paradise Lost' (1875); 'Sulamith' (1883), have had but a partial success.

**Ruble**, roo'bl, or **Rouble**, a silver coin, the standard of money in Russia, containing 278 grains of fine silver, and equal to about 76 cents in American money. In actual circulation there is little but paper money, valued at from ten to twenty per cent below its nominal value. A ruble is divided into 100 copecks. Half and quarter rubles, and fifth, tenth, and twentieth parts of a ruble, are coined in silver; gold coins of the nominal value of three rubles (the imperial ducat) and five rubles (the demi-imperial) are also coined.

**Rubric** (Lat. *ruber*, red), was the name applied to those portions of old manuscripts and books which, for typographical embellishment or on account of their importance in the text, were printed in red ink. Often, as in the old monastic manuscripts, only initial letters in the paragraph were so treated. With the development of the copyist's art, however, rubricated manuscripts became ornate; the initial letter of every noun, perhaps, was rubricated, chapter headings, thumb-nail indexes, marginal comments, and in cases whole passages of the text were highly ornamented rubrics.

The use of the red letter text became common in the case of religious treatises, and so from the fact that certain rules and directions in prayer books, explanations and responses,

PETER PAUL RUBENS.

are printed in red ink. This is the case with the Roman missal, where the matins, lauds, beatifications, etc., are always in red; in the liturgy, where the directions for the performance of the service are in red. In the old Bibles the chapter heads were so treated. Modern typography discards such profuse use of colored ink and usually substitutes in its place type of a different face from the rest of the text, but the portions thus emphasized are still called rubrics.

Spanish custom has given another significance to the word, wherein it is meant to denote the flourish so common after Spanish signatures. This likewise results from the fact that the rubrics were the most conspicuous features of a page.

**Rubus**, a genus of plants of the order *Rosaceæ*, of which more than 1,500 species have been described, but probably only 200 are well marked, the remainder being intermediate forms. They are mostly natives of the northern hemisphere and are especially abundant in Europe. About 40 are indigenous to North America. They are mostly shrubs whose stems (canes) are biennial or annual, prickly, erect, curving, climbing or trailing. They have simple or compound alternate leaves, white or pink flowers usually in corymbs or racemes, followed generally by compound fruits consisting of many drupelets. In the blackberry the drupelets are united to the receptacle; in the raspberry they are not. Besides the raspberry, blackberry, and dewberry (qq.v.), many species are useful for food or ornament. Among the best known are the European bramble (*R. fruticosus*), wineberry (*R. phanicolanus*), flowering raspberry (*R. odoratus*), and the cloudberry, yellowberry, bake-apple berry (*R. chamamorus*). The Rocky Mountain flowering raspberry (*R. deliciosus*), the brier rose, bridal rose or strawberry-raspberry (*R. rosafolius*), and *R. crataegifolius* are well known ornamental species in shrubberies, etc. See **BLACKBERRY**, **RASPBERRY**, etc.

**Ruby**, the rich red, transparent variety of corundum. The name is sometimes used for other red gems (see **RUBY SPINEL**), and improperly for richly colored garnets, of the variety pyrope. The stones called Cape rubies and Arizona rubies are only fine pyropes, coming respectively from the South African diamond mines and from Arizona and New Mexico. (See **PYROPE**.) Siberian ruby is a term sometimes applied to gems of rubellite or red tourmaline (q.v.), and Brazilian ruby to the deeper shades of pink topaz, altered to that color by heat. The true rubies recently mined in the Cowee Valley, in North Carolina, have attracted much interest, being in some cases as fine as those from Burma; but they are mostly small, and it is not certain whether they will prove of real importance. They occur in a greatly decomposed igneous rock, in the same manner as the very similar crystals of sapphire from Yogo Gulch, Montana. The rubies of Burma, formerly spoken of as Pegu, are derived from a crystalline limestone. In these cases, and indeed generally, the gems are largely found in gravels and surface deposits formed from the decomposition of the

parent rocks. Like all the deeply-colored corundum gems, rubies are strongly dichroic, their color varying with the direction in which light traverses the crystal, whether transverse or parallel to the axis of the prism. The presence of microscopic cavities or of included crystals of extreme minuteness, disposed in a certain parallelism to the crystalline axes, produces the optical effect known as asterism, which is exhibited by the highly prized gems called star rubies (and star sapphires). In less amount or when irregularly distributed, the same causes produce defects known as "silk," and cloudiness. Many efforts have been made to produce the ruby by chemical means, and a dozen or more processes have been devised with greater or less success within the past 50 years, but with little practical result. Crystals have been obtained, of fine color, but mostly small, or in flat hexagonal plates too thin to furnish gems. Some years ago, larger pieces appeared in the market, that caused some concern from their close resemblance to natural rubies. The process was not made known, but was judged to be that discovered by Frémy and Feil, by fusing an aluminate of lead with silica. They were detectable by the microscope, which showed that they contained minute cavities that were rounded and bubble-like, while those in real rubies are angular and crystalline. The French "Syndicate of Diamonds and Precious Stones" decided that all such rubies must be sold as "artificial," under penalty of fraud.

**Ruby Matrix** is a name recently given to a beautiful combination of red or pink corundum with a bright green variety of hornblende (amphibolite) found at the Cullakenee corundum mine in Clay County, North Carolina; it has been proposed to use it as an ornamental stone, though the ruby-corundum is not transparent enough to cut gems.

**Ruby Spinel**, this mineral is an aluminate of magnesia. It crystallizes in octahedrons, with a hardness of 8, and a specific gravity of 3.5 to 3.7, usually of some shade of red, sometimes very rich, and transparent to translucent. Fine specimens make beautiful gems, known as spinel rubies, not readily distinguishable from true (corundum) rubies, though less hard, less dense, and less valuable. The historic "Black Prince" ruby, in the crown jewels of England, is believed to be a spinel. True rubies may also be distinguished from spinels by the dichroism which belongs to all the deeply colored corundum gems. Red spinel has several other varieties, with special names; it is called Balas ruby when the color is rich pink, rubicelle when it inclines toward an orange red, and almandine ruby when it tends toward a purplish. Spinel is a frequent associate of the true ruby, in Burma, Siam, Ceylon, etc. It usually occurs in crystalline limestones, though occasionally found in other metamorphic, and even in volcanic, rocks.

**Ruby-throat**. See **HUMMING-BIRD**.

**Rückert**, Friedrich fréd'rik rük'ért, German poet and Orientalist: b. Schweinfurt, Bavaria, 16 May 1788; d. Neuses, near Coburg, 31 Jan. 1866. His education was received at Heidelberg and at Würzburg. He first began

to write under the pseudonym of 'Freimund Raimar,' and 'Deutsche Gedichte' appeared with that signature. From 1826 to 1841 he occupied the chair of Oriental languages in the University of Erlangen, and while there was called to Berlin as privy councillor to Frederick IV. Here he also pursued his work as a philologist and poet. He retired to private life in 1848, becoming one of the most prolific writers of his day. He had a remarkable command of language and wrote almost every known form of verse. His original poems relating to the East are: 'Morgenländische Sagen und Geschichten' (1837); 'Rostem und Schirvan: eine Heldengeschichte' (1838); and 'Die Weisheit des Brahmanen' (1836-9). His adaptations include 'Die Verwandlungen des Abu Seid' of Hariri (1826); 'Nal und Damayanti' from the 'Mahabharata' (1828); 'Amralkais' (1843); and 'Hamasa' (1846). Among his other works are 'Saul und David' (1843); 'Liebesfrühling' (1844); and 'Lieder und Sprüche' (1866). Consult biographies by Beyer (1868-77); Konrad Fischer (1889); and F. Reuter, 'Rückert in Erlangen und Joseph Kopp' (1891).

**Ruckstuhl, rückstool, Frederic Wellington,** American sculptor: b. Breitenbach, Alsace, 22 May 1853. At two he was brought to America by his parents who settled in Saint Louis, Mo. His art studies were begun in 1883 in Paris. His first exhibit, a life size nude figure called 'Evening,' won honorable mention in the Salon of 1888. His principal works are a bronze figure 'Victory,' on the soldiers and sailors' monument at Jamaica, Long Island; the bronze 'Solon,' in the Library of Congress, Washington, D. C.; and the heads of Goethe, Franklin and Macaulay which form a part of the façade; and the heroic marbles 'Wisdom' and 'Force' above the New York Appellate Court building in Madison Square, New York.

**Rudder,** an oar or other instrument by which a ship is steered, being that part of the helm which consists of a piece of timber which enters the water, and is attached to the stern-post by hinges, on which it turns. The action of the rudder may be thus explained: While it remains in line with the keel, the force of the water gliding past the deadwood, or narrow portion of the stern, is equal on both sides of the rudder, and equilibrium is maintained, but if the rudder be forced to one side the pressure is taken off on the opposite side, while from acting at a less angle the water exercises an increased pressure on the side to which the rudder is turned. The effect is to force the stern round on the centre of gravity as a pivot, the ship's head, of course, turning to the same side as that on which the rudder is. When the head has sufficiently deviated from its former line the rudder is permitted to resume its straight position. In sailing on a wind, the rudder is kept permanently on one side to counteract the tendency to make leeway.

**Rudder Fish,** so named from being perceived usually in the wake of ships, following the movement of the rudder, and doubtless attracted by the refuse thrown overboard, is a small fish of the genus *Pilichthys* allied to the mackerel family, very common in the Pacific and Atlantic oceans. *The Pilichthys perci-*

*formis*, the rudder perch, or black pilot fish of the fishermen of Martha's Vineyard, attains a length of from nine to twelve inches, and is caught on the coasts of Massachusetts and New York, specimens having been obtained in Boston Harbor hovering around the sterns of vessels or keeping near such floating bodies as casks, planks, logs, and other flotsam. The back and top of the head is brownish with black blotches, the sides bluish-white with minute black dots, and the under parts lighter; the color of the young is a bright bronzed black, variegated with yellow circular spots, obscure reddish hues and streaks of white and yellow lining the sides; there is a depression between the eyes which are protected by an overhanging bony ridge, and in front of the fleshy rays of the dorsal are eight short spines. The rudder fish belongs to the division of the scomberoids in which the first dorsal is composed of isolated spines connected by a low membrane, but unlike the scomberoids there are one or more spines in front of the anal fin.

**Rudder Grange,** a humorous story by Frank R. Stockton, which appeared serially in 1879 and was the first of the author's books to attract general attention. A slight thread of story suffices to connect a series of humorous episodes which result from the efforts of a young couple to establish themselves in a summer home at once desirable and inexpensive. In 'The Rudder Grangers Abroad' and 'Pomona's Travels' (1894), the principal figures in 'Rudder Grange' reappear.

**Ruddiman, rüdt-man, Thomas,** Scottish scholar: b. Raggel, Banffshire, October, 1674; d. Edinburgh 19 Jan. 1757. He was graduated at Aberdeen in 1694, revised and edited several works by Scottish authors, and to the famous poetical translation of Virgil's 'Æneid,' by Bishop Douglas, added a glossary, which brought him fame as a Latin scholar. In 1714 he published his 'Rudiments of the Latin Tongue,' a work which supplanted all previous Latin grammars in use in Scotland, and which he lived to see pass through 15 editions. In 1715 became a publisher and in this capacity edited and brought out many famous books, and in 1725 the first volume of his own 'Grammaticæ Latine Institutiones,' and an abridgement of the three volumes in 1740. Consult: Chambers, 'Life of Ruddiman' (1794); Chambers, 'Eminent Scotsmen.'

**Ruddy Duck,** a rather small, quick-diving handsome duck (*Erythraura rubida*), which is to be found throughout North and Central America, breeding in all suitable localities. It is related to several foreign sea-ducks, the Australian musk-duck, etc., but is itself confined to this continent. This duck is about 17 inches long, and chiefly tawny brown, the drake becoming glossy chestnut in full breeding plumage; considerably waved and dotted, and the lower parts mottled silver-white.

**Rude, François, fran-swa rôd,** French sculptor: b. Dijon 4 Jan. 1784; d. Paris 3 Nov. 1855. He was originally a blacksmith, but entered the Ecole des Beaux Arts in 1807 and was under the instruction of Cartellier. From 1815 to 1827 he worked at Brussels decorating the royal palace and subsequently settled at Paris, where his real artistic life began. His

chief works, which indicate a combination of antique simplicity with modern naturalism, are his 'Mercury' (1827), now in the Louvre; his 'Neapolitan Fisher Boy,' also in the Louvre; his 'Louis XIII.,' as a boy 1842; 'Sepulchral Monument of Cavaignac,' in the cemetery of Montmartre (1847); a 'Crucifixion' and the 'Maid of Orleans' (1852), both in the Louvre; 'Hebe' and 'Love as the Conqueror of the World,' in the museum at Dijon.

Rüdiger, *Fedor Vasilievitch*, Russian count and general: b. Courland, 1780; d. Carlsbad, Bohemia, 22 June 1856. He came of a noble Courland family, and entered the army when a youth. He saw active service in Germany and France during the campaigns of 1813-14 as a major-general, in 1818-29 served as a lieutenant-general in the war with Turkey; and after the suppression of the Polish rebellion, was promoted to be general of cavalry. Under Paskevitch he followed the campaign in Hungary in 1849, took an active part in the battles of Waitzen and Debrécsin, and on Görgey's attempted retreat to Arad, pursued him and compelled his surrender at Vídéka. During Paskevitch's absence in the Crimea in 1854, Rüdiger was appointed lieutenant-governor of Poland.

Rudinger, *Nicolaus*, German physician and professor of anatomy; b. Rüdeshelm, Prussia, 25 March 1832; d. Munich 23 Aug. 1896. After studies at the universities of Heidelberg and Gießen, he was graduated M.D. in 1855 at the latter university. He had exhibited a natural aptitude for anatomy and became assistant to his instructor Bischoff in the University of Munich, where in 1881 he was appointed Professor of Anatomy. In his lectures and his contributions to professional periodicals, photographic reproductions of his operations were notable features; from 1867 to 1870 he was co-editor of 'Monatsschrift für Ohrenheilkunde' and in 1877 of 'Beiträge zur Anthropologie und Urgeschichte Bayerns'; the most valuable of his numerous publications are 'Atlas des peripherischen Nerven-systems des menschlichen Körpers' (1872); 'Atlas des menschlichen Gehörorgans' (1875); and 'Topographisch-chirurgische Anatomie des Menschen' (1873-79).

Rudini, *roo-dé-né*, *Antonio Starabba di*, *Marquis*, Italian statesman. b. Palermo, Sicily, 6 April 1839; d. 7 Aug. 1908. In 1866 he became mayor of Palermo, and in 1867 a member of the Chamber of Deputies. He was appointed minister of the interior in the following year. After the fall of the Menabrea cabinet he held no prominent office until in 1891, when, having become the head of the constitutional party, he succeeded Signor Crispi in the ministry of foreign affairs, and was made premier. In 1892 the premiership passed again to Crispi, but in 1896 Rudini returned to power as a result of Signor Crispi's disastrous Abyssinian policy. He continued in the premiership until 1898, when he resigned his office. His renewal of the Triple Alliance and conclusion of peace with Abyssinia were the most important of his executive acts, while his continued yielding to the pressure of the radical party, and failure to weld the conservative elements of the Italian parliament are quoted against his administration.

Rudler, *Frederick William*, English scientist, educator, and writer: b. London 8 July 1841. A predilection for scientific study and research led to an early appointment as assistant in the Museum of Practical Geology in 1861. In 1870 he was elected assistant secretary to the Ethnological Society, and from 1876 to 1879 was professor of natural science in the University College of Wales, an appointment he resigned on being made curator of the museum. He was one of the lecturers of the London Society for the Extension of University Teaching, in 1880 was president of the anthropological department of the British Association; and in 1889 president of the Geologists' Association. He was appointed director of the Anthropological Institute, and editor of its 'Journal,' was co-editor of Ure's 'Dictionary of Arts,' and as a prolific contributor of scientific subjects to encyclopedias and technical periodicals is well-known.

Rudolf I., *roo-dólf*, emperor of Germany, founder of the imperial house of Austria: b. 1 May 1218; d. Germersheim 15 July 1291. He was the eldest son of Albert IV, count of Hapsburg and landgrave of Alsace, was brought up in the court and camp of the Emperor Frederick, II.; and on the death of his father succeeded to lands of a very moderate extent, which, in the spirit of the times, he sought to augment by military enterprises. He gained some territory by his marriage in 1245 and more by his frequent military aggressions. In 1273, while encamped before the walls of Basel, he received the unexpected intelligence that he was elected king of the Romans, and emperor, in preference to Alphonso, king of Castile, and Ottokar, king of Bohemia. His confirmation was not attained without some difficulty, however. Pope Gregory X induced the King of Castile to withdraw his pretensions, but the King of Bohemia, at that time one of the powerful princes in Europe, persisted in his opposition, and a war ensued, in which he was defeated and compelled to sue for peace, and agree to pay homage. He broke the treaty in 1277, but the following year was defeated a second time, and slain. The Diet of Augsburg in 1282 formally conferred Austria, Styria, Carinthia, and Carniola on Rudolf's two sons, Albrecht and Rudolf, as a joint inheritance. He restored peace and order to Germany, and wisely put down the private fortresses, which served as a retreat to banditti and to ferocious nobles. For these and other eminent services in the same spirit he obtained the title of 'a living law,' and was regarded as a second founder of the German Empire. He asked the Diet at Frankfort to secure the imperial throne to his son Albrecht, but the electors were jealous of the powerful family and their refusal caused such mortification to the aged emperor that he did not long survive. Consult: Kopp, 'König Rudolf und seine Zeit' (1845-9, continued by Bussan 1871); Henr., 'Rudolf von Habsburg' (1874); Schulte, 'Geschichte der Habsburger' (1887); Zisterer, 'Gregory X. und Rudolf von Habsburg' (1891).

Rudolf II., emperor of Austria: b. Vienna 18 July 1552; d. Prague 20 Jan. 1612. He was educated in Spain, and before the death of his father, Maximilian II., was crowned king of Hungary in 1572; king of Bohemia in 1575, the same year being also crowned at Ratisbon

## RUE—RUGBY SCHOOL

king of the Romans. He succeeded to the Austrian throne 12 Oct. 1576. His disposition was mild and his tastes inclined toward literature rather than toward government. Early in his reign he began to impose restrictions upon the holding of public offices by Protestants and in some districts civil war resulted. The western parts of the empire were enabled to overcome the designs of the king, and by 1603 the Protestants formed an offensive and defensive alliance at Heidelberg to maintain their civil and religious liberties. In Austria, Bohemia and Hungary, however, the Protestant religion was for a time practically suppressed. The Turks made constant inroads in the east and in 1596 Mahomet invaded Hungary, captured Erlau and defeated the Austrians under Archduke Maximilian, though he ceased his incursions at this point. In 1608 Rudolf's brother Matthias, who had made a treaty with the Turks and pacified the disaffected Hungarians, compelled Rudolf to acknowledge him king of Hungary and governor of Austria and Moravia. With this confirmation of Matthias' power the states of Austria regained the religious privileges they had enjoyed under Maximilian. In 1611 Rudolf was formally deposed and Matthias succeeded him. He was the patron of Kepler and Tycho Brahe and the astronomical calculations produced by these two are known as the "Rudolphine Tables." Consult: Gendely, 'Rudolph II. und seine Zeit' (1863-5).

**Rue**, a perennial (*Ruta graveolens*), wild in the Mediterranean regions, but also cultivated. Its stems are about two feet high, bearing alternate decoumpound bluish green leaves, pellucid-dotted, with an acrid juice and bitter taste; and corymbs of yellowish green small four-merous flowers, with crimped petals. Rue has been employed medicinally on account of its antispasmodic and stimulant properties, and was also used in folk medicine as a disinfectant, probably because of its strong and disagreeable odor and taste, which, however, did not prevent its use as salad. Rue also entered largely into magic rites, and witch-lore. Early missionaries in England were said to have sprinkled water from brushes made of rue, whence the name referred to by Ophelia. "There's rue for you . . . We may call it, herb of grace o' Sundays," and Perdita speaks of it, with rosemary, as one of the flowers for remembrance.

**Ruff**, a sandpiper (*Machetes pugnas*) of the northern parts of the Old World, the female of which is called "reeve." It is about 10 inches long, and the bill  $1\frac{1}{4}$ ; above it is varied with black, rufous, and gray, arranged in oblique bands on the scapulars and tertiaries, and whitish below; primaries dark brown, with green reflections above and with inner webs finely mottled toward the base; the tail transversely barred; sides of rump white, bill brown, and legs yellow. The males in spring have the feathers of the neck developed into a kind of ruff, whence the common name, and the face is covered with reddish papillæ; they fight during the breeding season, unlike most wading birds; they are also polygamous, and larger than the females, in these respects seeming to form one of the links between wading and gallinaceous birds. The colors of the ruff vary exceedingly, and no two are precisely similar. They

are natives of northern Europe and Asia, migrating southward during winter, and they are found chiefly in flocks, in marshy districts; they feed at night, on worms, insects, and larvae; the nest is made of coarse grass, and is placed in a hollow of the ground; the eggs are 4 or 5, pointed, green, with brown specks. Their flesh is highly esteemed for the table; they are taken alive in nets, and are fattened for market on bread and milk and boiled wheat, in a dark place to prevent their fighting; great numbers are sent from Holland to London.

**Ruffed Grouse.** See GROUSE.

**Ruffed Lemur.** See LEMUR.

**Ruffin, Edmund**, American agriculturist: b. Prince George County, Va., 5 Jan. 1794; d. near Danville, Va., 15 June 1865. He was educated at William and Mary College, served in the Virginia legislature, was for many years president of the Virginia Agricultural Society, and in 1833-42 editor of the 'Farmer's Register.' He was an ardent state-rights man, and as member of the Palmetto Guard of South Carolina fired the first shot on Fort Sumter in 1861. He committed suicide because of his unwillingness to live under the United States government. He published: 'Essay on Agricultural Education' (1833); 'Anticipations of the Future to Serve as Lessons for the Present Time' (1860); edited William Byrd's 'Westover Manuscripts' (1841); etc.

**Rugby, England**, a market town of Warwickshire, 81 miles by rail northwest of London. It is picturesquely situated on an eminence south of the Avon, and is celebrated for its public school. (see RUGBY SCHOOL.) The parish church recently restored, the modern municipal offices, and the free public library are other noteworthy features.

**Rugby, Tenn.**, the place in Morgan County, about 140 miles north of Chattanooga, where Thomas Hughes (q.v.) and others from England established a colony in 1880. They purchased a large tract of land, laid out a town, divided the remaining portion into farms and parks, and established several industries. It is in a rich mining and agricultural region on the Cumberland plateau. The settlement proved a failure; but the place is now a health resort.

**Rugby School**, a famous English public school founded in 1567 by Lawrence Sheriff, who bequeathed for its support property in Manchester Square, London. Until the second quarter of the 19th century its importance was local in character, however, but under the headmastership of Arnold (q.v.) 1828-42, it became one of the greatest schools of England,—to be ranked with Westminster, Eton, and Harrow. Among famous headmasters who followed Arnold are Archbishop Tait, the late Dean Bradley of Westminster, the late Archbishop Temple, and John Percival, now bishop of Hereford, who was succeeded in 1895 by Rev. Herbert Armitage James, the present headmaster. The roll of distinguished Rugby scholars is a long one; among them may be mentioned Matthew Arnold, Dean Stanley, Landor, Clough, Thomas Hughes, author of 'Tom Brown's School Days,' Dean Vaughan and Lord Derby. Under the mastership of Dr. Temple (1857-69) the chapel was rebuilt, a gymnasium erected, and other

new buildings added, while under Dr. Jex-Blake (1874-87) still more building was carried on and Rugby is to-day particularly modern in the character of its buildings, which are Elizabethan in style, and in its appointments generally. Consult Goulburn, 'The Book of Rugby School' (1856); Hughes, 'Tom Brown's School Days' (1857); 'Life of Thomas Arnold' (1860); Bloxam and Payne-Smith, 'Rugby: its School and Neighborhood' (1889); Rouse, 'History of Rugby School' (1898).

**Ruge**, roo'gē, Arnold, German socialist: b. Bergen, Prussia, 13 Sept. 1802; d. Brighton, England, 31 Dec. 1880. He was educated at Heidelberg, Jena, and the University of Halle, where in 1830 he became a professor. His first literary production was a translation of Sophocles' 'Œdipus in Kolonos' (1830). He was later identified with the founding of the 'Halleische Jahrbücher' and became known as an advocate of radical doctrines. In 1843 he went to Paris where he was associated with Karl Marx, and there published his 'Zwei Jahre in Paris.' In 1847 he started a journal, 'Die Reform,' in Berlin. Accused of complicity in the revolution of 1848, he fled to England. He was there identified with Mazzini and Ledru-Rollin in their efforts to organize a democratic league for the establishment of political equality throughout the world. The movement to unite the provinces of Germany in 1866-70 was strengthened by his sympathy, and his services in this cause were recognized by the German empire. He published: 'Political Pictures' (1848); 'Our System' (1850); 'In Former Times' (1862-7); and a 'Manifesto of the German People' (1866).

**Rügen**, rū'gēn, an island belonging to Germany; in the Baltic Sea; area, 377 square miles. The coast has many indentations; on the northeast the island terminates in a chalk cliff, nearly perpendicular and about 400 feet above the water. Peculiar shaped boulders are found on different parts of the island. According to Tacitus, the ancient Germanic goddess Hertha (Earth) was worshipped here at Hertha Lake. The soil is fertile; agriculture, stock-raising, and fishing are the chief occupations. The coast villages are popular sea-bathing resorts. Bergen is the capital. Pop. 46,800.

**Rugendas**, roo'gēn-dās, Georg Philipp, German painter: b. Augsburg, 1666; d. there 1742. His right hand becoming disabled he painted and engraved with his left. He exposed himself to the fire and carnage at Augsburg that he might delineate the scene.

**Ruger**, roo'gēr, Thomas Howard, American army officer: b. Lima, N. Y., 2 April 1833; d. Stamford, Conn., 3 June 1907. He was graduated from West Point in 1854, studied law, and in 1855-61 was engaged in practice. At the outbreak of the Civil War he was appointed lieutenant-colonel and was prominent in numerous engagements. He suppressed the draft riots in New York in 1863, was in command of a division at Gettysburg, served under General Sherman, and in 1864 was brevetted major-general of volunteers. He was mustered out of the volunteer service in 1866, and in that year was appointed colonel in the regular army. In 1868 he was military governor of Georgia, superintendent at West Point in 1871-6, and in 1876-8 was in command of the Department of

the South. He was promoted major-general in 1895, and in 1897 was retired.

**Ruggles**, rū'glz, Timothy, American lawyer, politician, and loyalist: b. Rochester, Mass., 20 Oct. 1711; d. Wilmot, Nova Scotia, 4 Aug. 1795. He was graduated from Harvard in 1732, represented Rochester in the general court in 1736, opened a law office at Sandwich, Barnstable County, and was connected with many cases of local importance in Plymouth, Bristol, and Barnstable counties. Subsequently he removed to Hardwick. In 1755 he was second in command to Sir William Johnson at the battle of Lake George, in 1756, was made judge of the court of common pleas of Worcester County, and represented Hardwick in the general court. In 1762-3 he was speaker of the house, and from 1762 until the Revolution chief justice of the court of common pleas in Worcester County. He served with distinction in 1759-60 in the expeditions against Quebec and Montreal, and in recognition received the sinecure post of surveyor-general of the King's forests. He was a delegate in 1765 to the Stamp-act congress at New York and was elected its president. Upon his refusal to forward to Great Britain the addresses and petitions passed by the congress, he was reprimanded by the general court. From that time he was identified with the royalist cause. In 1774 he was made mandamus councillor, and in consequence was forced for safety to flee from Hardwick to Boston, then garrisoned by the British. He made some efforts to recruit a loyalist corps, and in 1779, on the departure of the British troops, went with them to Nova Scotia, where he became a proprietor of the town of Digby. He was a scholar and wit, and an excellent, though aggressive, pleader.

**Ruga**, Oriental. *History*.—The origin of the floor coverings, popularly known as Oriental rugs, is a matter of tradition, and therefore purely suppositional, for the fragmentary record of the ancients, on this subject, is casual and exceedingly incomplete.

Undoubtedly, however, along with the slow evolution of human progress, rugs, in some form, filled their proper places in the scant household furniture of primitive man.

An old Hebraic tradition ascribes distinction of skillful spinning of wool and weaving of cloth, to Naamah, daughter of Lamech, who was a near descendent of Adam, thus placing the handicraft of weaving close to the Biblical account of the beginning of the human race.

It is not at all improbable that Egypt, the successful producer of many useful industries of the ancients, improved the crude handwork of her predecessors, for we possess records of rugs on her rock-cut tombs, carvings, and monuments, some of which date as early as twenty-seven centuries B. C.

Other wall paintings, stone carvings, and monuments in the Euphrates Valley indicate clearly that the dwellers of these regions such as Chaldeans, Assyrians, Armenians, and Persians were the first to use the rug for floor coverings, wall hangings, tomb coverings, awnings, and for devotional purposes; and that afterwards the conquerors of these peoples, the Greeks, Romans, Turks, Turkomans, and Saracens, took up the industry and spread its popularity throughout their dominions.

**Ancient Authorities.**—Besides Biblical writers, among the ancients who mention rugs and carpets, are included Diodorus, Ebers, Homer, Plautus, Horace, Pliny, Josephus, Arrian, and almost all writers of note; but as stated above, not one of these famous men imparts definite information concerning the industry.

**Introduced into Europe.**—While very little is known concerning the rugs of the ancients, our knowledge takes definite shape and grows in volume along with the triumphant march of the religion of Mohammed, the great prophet of Arabia, whose enthusiastic followers went from victory to victory, till they threatened the very existence of mediæval Europe.

Rug making was introduced to Europe by the Moors, whose palaces and mosques in Cordova, Granada, and Castilia, were adorned with magnificent carpets; and later, when the Crusaders returned from their wars against the followers of the Crescent, they brought back with them not only a violent desire for Oriental luxuries, but a knowledge of Oriental handicraft, most important among which were rugs and carpets.

Thus, in about the latter part of the 13th century A. D., rugs were introduced in Europe and England as objects of wonderful ingenuity and of great value.

From that time interest in rugs from the Orient has constantly increased among all civilized people's till to-day they rule supreme as the most desirable and most artistic floor coverings in the world.

**Process of Making.**—The general process of rug making of to-day is as old as when it was described first by ancient writers. To-day rugs are made by the descendants of first rug makers in the same crude and primitive fashion. Nothing has been changed—nothing could be changed—for the process is so absurdly rudimentary that it precludes improvement. In the use of material, dyes, and implements there has been no alteration made, since before the period when Cleopatra was presented to Cæsar wrapped in a magnificent carpet.

(a) The Loom, more properly the frame, on which a rug is to be made, consists of two perpendicular poles (not infrequently two trees) driven in the ground at a desired distance from each other; to these are fastened two horizontal bars, one on top, the other at the bottom of the poles.

(b) Tools.—It is an absurdity to dignify by the name of "tools" a crude wooden or iron comb, and a pair of common shears, which about conclude the description of the "machinery" of rug making: no other implement is required for the production of the finest Oriental rug.

(c) The Warp.—The warp of a rug consists of desired thickness of thread or twine in wool, cotton, linen, hemp, goats' or camels' hair, and in some cases silk, which is stretched, back and front, upon the horizontal bars of the frame, at even spaces, to form the foundation of the rug.

(d) The Weft.—Before actual tying of the colored yarn to the warp, the maker weaves the salvage or diaper, beginning at the bottom of the warp. To do this he introduces a shoot of hemp or wool or cotton by means of a treadle and crossing the warp, which is

repeated till a desired width is woven; then he beats this down with his comb. This cross warp, introduced after each row of the knotted yarn, is called the weft of the rug, which very often determines the fineness and the strength of the finished article.

(e) The Knotting.—All Oriental rugs are actually tied to the warp—tuft by tuft separately—these are tied by hand; so, properly speaking, rugs are not woven, but built, tied, knotted. This part of the process requires great skill, accuracy, and more than Job-like patience.

Two ways of knotting are employed throughout the Orient in rug making: (1) The Persian (Sehna) knotting; (2) the Turkish (Ghiordék) knotting. The Persian knotting consists in winding the two ends of the yarn around two separate threads of the warp, and bringing the two ends of the yarn to the surface from between each space of the warp. The Turkish knotting consists in winding the two ends of the yarn round two separate threads of the warp alternately and bringing the two ends to the surface between every two threads.

**The Yarn.**—Almost every woolly animal and hairy beast contributes its quota to the floor covering of the Orient, and cotton hemp and linen, in some cases silk, and even gold and silver threads are used to bind together the "flowing lines of beauty" of the rug.

In the inaccessible fastness of Kirman, the vast mountain chains of Kurdistan and in the enchanting valleys of Shiraz and Kashmere and Euphrates, countless flocks of sheep yield the finest wool; not to mention the soft and downy wool raised in the shadow of Ararat in Armenia, and under the shelter of Demavend in Persia; and the camel of Arabia, and the goat of Angora and of Bokhara, vie with each other in their contribution of marvelous hair, which is transformed into bits of scintillating gems in the hands of the skillful artist of the Orient.

The wool, after being sheared, is washed thoroughly, and sorted, and carded upon crude wooden or iron rakes, and afterwards spun very much after Mr. James Bryce's description: "Each, [spinner] like the fates of Catullus, bore a distaff in her hand, with a lump of wool upon her wrist, and this they plied as they drove their flocks before them." And, when thus the wool is spun, it is made into skeins ready for the dyers' vat.

**The Dyes.**—To dye the yarn is a separate industry in the Orient, and the skillful dyer holds equal rank with the "dervish" and the conjurer—for, to extract beautiful dyes from animals, insects, trees, plants, roots, herbs, seeds, barks, flowers, berries, fruit, and from every imaginable thing yielding color, is no less wonderful than the feats of a howling "dervish" or the mysterious exorcism of the magician's wand.

From the old Tyrian purple, which adorned the royal vestments of the ancients, and which is a lost dye to-day, to the ordinary red madder of Asia-Minor, the extracting of dyes and coloring the yarn is a long drawn process in an exceedingly primitive manner.

The usual method is to boil in water the ingredients of a given color, with their mordant of vinegar or some other acid, in an earthen pot, till the desired constancy is

reached, every little while the dyer smelling and tasting the liquid. Afterwards the yarn in skeins is dipped in this preparation, till the required shade is obtained, then withdrawn and dried in the sun. Often the dyed yarn is exposed to the influence of the elements for weeks and weeks, till in the laboratory of nature the dye becomes a permanent portion of the wool, and remains thus as long as the material exists.

There are some dyes which require no such treatment, others, which must be produced in an entirely different manner, but in each case the skilled dyer knows just how to obtain best results; and left to his own resources, given his own time, he usually accomplishes the desired end.

**Ornamentation.**—Taking a wide survey, from the sea of Marmora at the West, to the Yellow Sea at the East, Oriental rugs may be divided into two general classes, according to ornamentation: (a) geometrical; (b) floral. The development of geometrical ornamentation is attributed to the Turanian races occupying the northeastern portions of Asia, most of whose rugs bear the stamp of a more primitive type, which lead us to believe that they are more closely related to the rugs of pre-historic times. The design, popularly known as the Swastika or filfot cross is believed to constitute the basic pattern of all geometrical ornamentation in rugs—indeed, some authorities go further in the assertion that the Swastika was the first design used for ornamentation by the human race.

The floral ornamentation, a later and more intricate method, was adopted by the Aryan races, and carried to its highest development by people inhabiting the country lying between the Caspian Sea and the Persian Gulf.

The typical design of floral ornamentation is the 'flower and knop,' a conventionalized resemblance to the Egyptian lotus or the tree of life of the ancients.

An endless variety of patterns of both classes appear on rugs; they are mixed and intermingled so hopelessly, that a rigid classification according to ornamentation is almost impossible.

Purely floral patterns, such as representations of leaves, trees, blossoms, rosettes, palmettes, are strewn over or under squares, circles, stars, octagons, medallions, and various forms of the Swastika in a manner so blended, that a classification of rugs according to ornamentation resolves itself to an unsolvable riddle.

**Symbolism.**—It is stated by enthusiastic writers on Oriental rugs, that a fascinating array of symbolism lies beyond those charming patterns.

The rug itself typifies the universe, and its various designs the ever-changing phenomena of life. The principal coloring of the field of the rug, if red, signifies life, victory; if blue, royalty; if white, purity; if green, devotion; if black, evil; if yellow, nobility; and so on to the end.

In patterns, the Swastika signifies auspiciousness, good luck; the flower and knop, fortune, life everlasting; the circle, immortality; the star, the Star of Bethlehem; the triangle, the charm of Solomon; the square, 'the square deal'; the comb, cleanliness, etc.

Among vegetation, the rose typifies love; the lily, purity; the scarlet tulip of Babylon, passion; the blossom, innocence; the fruit, fecundity; the tree, abundance, etc.

And the star of six points represents Allah! It is reasonable to ask, however, that this endless chain of designs having come to us from the mythological past, where the light of knowledge fades in the mist of tradition, who can say positively that a certain design typifies a certain idea—and that is not "one man's guess as good as another's"?

The greatest charm of Oriental rugs lies in the simplicity of construction, in the impress of individuality of effort, and in the incomprehensible mystery of design. The manner of their making is primitive; the materials used are all home made, and the ornamentations in odd lines, angles, squares, or in grotesque likenesses of 'fish, flesh, and fowl,' the original meanings of which are forever buried in the first ages of mankind—these, and the wonder of their marvellous colorings, the secret of many being still secret and many another being entirely lost, add to the teasing witchery of the Oriental rugs.

**Names.**—To the uninitiated, of the many unsatisfactory peculiarities concerning the subject, the naming of Oriental rugs is the most perplexing. There is no fixed rule that would classify clearly the enormously diversified output of rugs within the vast area of about three-quarters of the continent of Asia. There are, however, six recognized geographical divisions, which include about all Oriental rugs of our days, namely: (1) Persian rugs; (2) Turkish rugs; (3) Caucasian rugs; (4) Turkoman rugs; (5) Indian rugs; (6) Chinese rugs.

**Persian Rugs.**—Persia, the home of floral ornamentation, and the most marvellous exponent of textile productions of the Orient, stands on the pinnacle of fame by unanimous consent. She attained this enviable position especially during the benign reign of Shah Abbas, in the 16th and 17th centuries, under whose wise encouragement she reached the golden age of the rug industry.

The Ispahan rugs, made under Shah Abbas, with their gorgeous field of 'Ispahan red,' decorated in tulip, rose, lotus, iris florations, fastened together in chiselled tracery of refined meandering lines and angles at once puzzling and fascinating, established a new epoch of the rug industry, never equalled since.

And a somewhat similar pattern of the Ispahan having been evolved, the glossery of Persian rugs was enriched by another famous type of pattern called the 'Shah Abbas,' after the most honored monarch of Persia. The Ispahan rug, as a class, stands alone, and its specie is extinct, only a very few perfect specimens and many fragments being jealously preserved in museums or in private collections.

Persians, who ought to know best, divide their rugs into the following groups according to ornamentation mostly, which is different from the accepted division in common use abroad: (a) Kirman, (b) Herati; (c) Iran; (d) Hamadan; (e) Kurdistan.

(a) The Kirman group is subdivided into the following celebrated specimens: (1) Kashan; (2) Kirman or Kirmanshah; (3) Saruk; (4) Tabriz. The chief characteristics

of this group lie in their extreme fineness of texture, brilliance of coloring, and purely floral ornamentation, which is carried to its highest perfection.

Mostly of modern construction, but copies of some old forms, with floriated medallions or panels or scrolls, replete with vases of flowers, and representations of birds or beasts, these rugs show the scintillating splendor of jewels in textile art; and they command high prices on the American market.

(b) The Herati group includes: (1) Meshed; (2) Khorassan; (3) Shah Abbas; (4) Feraghan; (5) Joshaghan; (6) Youraghan.

To the heart of a true son of old Iran, this group of rugs is the most precious of all, for here are preserved the glorious traditions of his forefathers; here, the holiest shrine of his faith; here, the revered name of his most illustrious Shah, and here, the true splendor of his matchless artistry. The chief excellency of this group is in the development of the leaf pattern; be it the palm leaf, the rose leaf, the lotus leaf, or the so-called river-loop design; it fills a very prominent part of ornamentation either in a curled position as in the Feraghan, or spread out on borders, corners, and medallions as in the Meshed and Khorassan, or in groups and clusters of splendid tracery as in the Shah Abbas.

(c) The Iran groups contains the following popular specimens: (1) Teheran; (2) Mihr; (3) Saraband; (4) Shiraz.

Most worthy of mention, and very much admired by all Orientals, are the Saraband and Shiraz rugs, besides the Mihr, which really is the finest grade of Saraband.

The characterizing peculiarity of these, especially of the Mihr and Saraband, is the palm leaf pattern, row upon row, on a field of red or blue and seldom ivory, each row of palm leaf facing in an opposite direction.

In the Shiraz rugs the palm leaf design, if employed at all, is used without regard to regularity or size. The Shiraz rugs show an utter disregard to conventional patterns, therefore, they are among the most interesting rugs of the Orient. Often medallions run through the centre which are decorated with flowers, leaf patterns, birds, and animals, much after the style of Kirmana. But the distinguishing points are: the salvages overcast in two or more colors with tassels here and there, and the two ends finished with pretty needlework patterns.

In the Teheran the patterns may or may not show the palm, but they are kindred rugs in all other respects.

(d) The Heriz group contains: (1) Ardebil; (2) Hamadan; (3) Bakhshaish; (4) Gorovan; (5) Serapi.

In these rugs, the medallion with its various modifications is carried out in a most pronounced fashion; especially in the Gorovan and Serapi, where the medallion stands out in barbaric outline upon a field of red, white, blue, green, or brown hues of great brilliancy.

In the Heriz and Hamadan, the undyed hair of camel plays a prominent part, often covering the whole rug, decorated with rosettes, medallions, pendants, and heavy traceries, all interwoven in bold contrasts. In the Ardebil and Bakhshaish and the Heriz proper, these striking contrasts are entirely eliminated, indeed,

these show such superb mellowness of coloring, graceful lineations and superior floriations, that they bespeak of times of the long ago.

(e) In the Kurdistan group are included the following specimens: (1) Sehna; (2) Bijar; (3) Lullé.

It would seem that the Sehna rug should not fall under this heading, for there is no similarity of style or texture to the Kurdistan; but the people of Persia class this rug as a Kurdistan.

The Sehna, so far as fineness of texture is concerned, belongs to the Kirman group, and not infrequently surpasses even the best Kashan texture of the Kirman group. Hundreds of knots are crowded in a space of one square inch with shortest cut yarn, till it becomes almost beyond belief that human fingers are capable to produce such a fabric.

The Sehna rug shows no reckless disregard to design or color; whether rosettes or palm patterns or medallions, every line is clear cut, every curve masterly rounded, and every color faithfully reproduced. The Sehna is the thinnest rug made in the Orient.

In strongest contrast to the Sehna are the Bijar and Lullé of the Kurdistan; they recognize no established pattern; accept no school of coloring, and follow no rule of texture.

Generally thick and heavy in texture, employing all the standard Persian designs without regard to fitness or uniformity of position on lustrous fields of rich and deep coloring; whether coarse or fine, heavy or light, these rugs compel admiration by reason of their extraordinary solidity.

*Turkish Rugs.*—In the Turkish empire live many races, peoples, and religions, which are not at all affiliated with one another—remnant nations of Syria, Babylonia, Armenia—Chaldea, Greece, Hebrew, etc.—consequently, the textile productions of this region are somewhat mixed and rather difficult to classify. It appears, however, that the Turkish detached mode of ornamentation repeated on some parts of rugs, and the generous use of both floral and geometrical designs usually seen in all Turkish products, would give them a certain distinction; add to this the very popular pattern found in the praying rugs, and Turkish rugs become an individual class in the family of Oriental rugs.

Moreover, most Turkish rugs are coarser than Persians, their pile being longer, looser, thicker, and softer.

The people of Turkey divide their rugs into the following principle specimens: (a) Gheordez (Yordez); (b) Koulah; (c) Ladik; (d) Melez; (e) Berghama; (f) Koniah; (g) Kir-Shebir; (h) Kutahia; (i) Mousul; (j) Kurd; (k) Yuruk; (l) Anatolian.

(a) In conception of design, execution of workmanship, and combination of coloring, the Gheordez stands first in all Turkish rugs, and is most highly praised by Turk, Greek, Armenian, European, and American alike.

Usually made of praying-rug design, the field has a solid coloring of ivory, blue, red, sometimes green, with the niche or dome resting on two ornamented columns; but at times the columns being absent, the dome is supported by highly conventionalized patterns of the tree of life.

A wide border, generally of the same color-

## RUGS

ing as of the field, is decorated with flowers and configurations so clustered as to form a superb square, which is repeated on the four sides of the rug, and frequently on the panels, over and under the enclosure of the praying niche pattern.

Two or several narrow borders in detached patterns surround the principal border; and on the two upper corners filling the trigonal spaces of the praying dome, are distributed figures bearing a resemblance to the main border. Often a bejeweled lamp hangs down from the center of the dome.

The colorings of the Gheordez of old are impossible to describe appropriately, and it might be added with truth, equally impossible to reproduce in paint.

(b), (c), (d) Koulah, Ladik, Melez, these three, are kindred rugs to the Gheordez, but they are not equal to the latter.

In Koulah, the praying dome is often indented or otherwise misshapen, and the field, instead a solid color, is decorated with patterns. It is marked also with several narrow stripes, for border, with startling contrast of colors.

The Ladik may be called a better rug than the Koulah, for it often possesses beautifully subdued greens, deep reds, blues, all blended attractively.

The Melez might be named as a twin sister to the Ladik, for it has all her characteristics, and only the trained eye can properly distinguish between them.

(e), (f) Berghama and Koniah rugs generally show medallion designs and a field well covered with geometrical patterns; they have also wide attractive borders covered with floral decorations. In size these rugs are made nearer square than other Turkish productions, with a heavy, silky pile and very attractive colorings.

(g) The Kir-Shehir products, praying-rug design or other, generally small rugs possess much resemblance to Ladik and Melez, they are, however, coarser rugs with brighter colorings and with unpleasant contrasts.

(h) Kutahia or Kutais, is a longer rug than the foregoing specimens with no special characteristic in design or coloring. A satisfactory rug usually, with silky surface, pleasing design and fine coloring.

(i), (j), (k) Mousul, Kurd, Yuruk. Strictly, these three grades do not belong to the Turkish family of rugs, yet neither could they be classified under the Persian group, and since the provinces in which they are made fall under Turkish rule it is proper to call them Turkish.

In design, in texture, in workmanship, these are the 'heavy-weights' in rugs. There is coarseness, boldness, and a wild strength in these rugs, which indicates the mountain, the desert, and the ravine; usually made of good wool and of good colorings (often exceptionally good), they lack the refinement of a Herati or the exquisiteness of a Gheordez.

The Kurd and the Yuruk especially, show an utter disregard to regularity of design or texture; sometimes long and shaggy like the matted wool of a sheep, they defy any accepted school of rug making.

(l) Anatolian.—There are several other grades made in Turkey, especially small mats, which are covered by this name. The Anatolian rug is usually of heavy quality and not

very fine, but in coloring surpasses many others. The wool is exceedingly soft, and the colors frequently of primary dyes, and when mellowed by age, it develops a sheen which rivals silk productions.

*Caucasian Rugs.*—In Caucasian rugs, the geometrical ornamentation is carried to its perfection. All conceivable designs in line are employed with great profusion and bewildering effect. Generally there is one principal color to which all other colors are subjected in clear cut designs, sometimes without shadings, giving the effect of inlaid stonework.

In texture Caucasian rugs are medium, although there are some exceedingly fine specimens made, but these are exceptional.

In size these rugs are not very large, sometimes they are made long and narrow, but mostly of medium size.

In designing they show star shapes, circles, fretwork, insect shapes, diamonds, triangles, various forms of the Swastika, squares, medallions, dragon designs, etc.

These are the following principal well-known kinds of rugs made in Caucasia: (a) Daghestan; (b) Kabistan (Kuba); (c) Shirvan; (d) Darbent; (e) Karabagh; (f) Kazak; (g) Chichi; (h) Circassian; (i) Kashmir (Soumak).

The Daghestan, the Kabistan, and the Shirvan are rugs made on similar lines. Their colors, designs, and texture are not different from each other, except the Kabistan, which is usually of finer construction. The geometrical elongated star and the Swastika and other lineal decorations are common to all, with beautifully vivid colors attractively arranged.

The Darbent rug shows a strong, barbaric nature like that of the Kurd and Yuruk, only in the Darbent there is more uniformity of design, and the texture is not so coarse.

The Karabagh rug shows more of Persian mode of designing than any other Caucasian rug. Upon its black or brown field are strewn at regular distances, magnificent delineations of leaf and flower patterns in various shades of tan and old magenta colors—but this is the Karabagh of olden times. The modern product is a mixture of homely designs, crude dyes, and coarse weaving, showing a careless haste of workmanship.

The Kazak rugs are the heaviest of all Caucasians and different in floriation. It appears, the makers of these rugs have endeavored to develop the gruesome in design, for on their products are shown various grotesque shapes of the dragon and other creeping creatures with startling effect. One distinguishing point of Kazaks is in their size which is nearer square than any other Caucasian product; another, is in the peculiar quality of the twisted yarn, which, when untwisted after years of usage, is divided into hundreds of fine ends, effecting the surface of the rug like a smooth velvety lawn.

Chichi rugs are made fine usually, and differ from other Caucasians in ornamentation. On a dark or light colored field are distributed regular patterns in cut squares or rectangular forms, giving the appearance of latticed panel.

Circassian rugs depart entirely from Caucasian mode of ornamentation. These are among the choicest, if not the choicest products of this region. A favorite design consists in pattern of superb flowers in full bloom, or

## RUGS

foliage artistically clustered and connected one with the other by graceful long lines.

Kashmir (Sumak or Shamakha) rugs are devoid of nap, they are made what is commonly known as the flat stitch style like the old Kashmir shawls of India from which they derive the name. In design they are typical Caucasians, and by reason of the absence of the nap, they show their designs in bold relief, clear cut, and prominent. The long ends of the yarn, left on the back, give weight and softness of texture.

**Turkoman Rugs.**—There are two divisions of the Turkoman rugs: Western and Eastern. In the Western Turkoman rugs the chief color, universally employed, is red with all its shades and kindred colorings, and the principal design, the octagonal or Bokhara; embracing the following well-known specimens: (1) Bokhara; (2) Afghan or Khiva; (3) Yomud; (4) Bushir; (5) Beluchistan.

Of these, Bokhara rugs are the finest and most valuable. It is impossible to mistake the Bokhara after once seen. The octagonal device, in shades of blues, ivory, and reds, is stamped on every Bokhara upon a field of some shade of red. The octagonal pattern is divided into four, with the diagonal sections resembling each other. They are the finest of all Turkomans in texture and sometimes so fine that they rival the best productions of Persia.

The praying-rug of this class preserves the general characteristic color of red. It, however, shows no octagonal device; there is the usual dome pattern in a more pointed shape near the top; and the whole rug, usually about four feet by five, is divided into four sections, decorated with highly conventionalized devices of the Swastika.

Afghan or Khiva rugs, made of coarser texture and of larger size, adhere to the Turkoman red and octagonal pattern most faithfully—in the large regularly arranged octagon is often seen clover leaf and sometimes a portion of dragon designs. Rich in coloring, heavy in pile, these rugs frequently mellow into lustrous and velvety fabrics.

The Yomud rugs are of darker shades of the maroon; and the detached regular octagon is transformed into an elongated diamond design fringed with dragon claws or Swastika devices. The Yomud usually is of very fine texture and is made in large size.

Bushir rugs classed, herein, are Turkoman only in coloring and texture. They show no octagonal pattern; often being decorated with palm devices; sometimes with Herati designs, and with ornamentations generally found in Caucasians. Made in rather longish sizes, loose texture, strong, silky, and desirable.

Beluchistan rugs are another class of the Turkomans which bear no resemblance to the Bokhara. Generally small in size, they deviate from the red shades often, and show subdued shades of maroon, blue, ivory, camel's hair, and rarely green. In design they employ the floral as well as geometrical forms. The general effect of Beluchistans is dark.

Eastern Turkoman rugs may be subdivided to: (1) Ganji or Genghis; (2) Samarkand; (3) Kashghar; (4) Yarkand.

The Ganji rugs are made by Turkoman nomads, of goat's hair or wool with long silky texture, the principal color being white or

yellow, on which are spread at regular distances rather crude geometrical devices.

Samarkand rugs reveal Chinese characteristics in coloring and design—usually of yellow, tan, or red and blue, they have several round figures intersected with strange floral designs and geometrical patterns.

The fret decoration is pronounced on their borders. Heavy and rather coarse in construction these rugs are attractive by reason of their simplicity of designing and uniqueness of coloring.

Kashghar rugs, coarse in texture are stolid in design and simple in coloring. Often only three different colors appear—a solid color for the field and another solid color for the simple geometrical design and a third, to separate the lines and to mark the borders. These and the Yarkand rugs similar to these, rarely leave their native places, the easternmost part of Turkestan.

**Indian Rugs.**—Strictly speaking India sends out only large carpets, the manufacture of which is in the hands of European and American firms, who have established large centers of production in the Punjab, Kashmir and Madras districts, commonly known as Agra, Lahore, Amritsar, Mirzapur, Kandahar, Ardahan, etc. Arbitrary names these last, named by the manufacturers themselves without regard to location.

These American and European houses not only control the output of rugs but also their ornamentation and coloring; they make rugs to order, according to the ordered colors and patterns required by their customers. Thus individuality and character is altogether wanting in these productions, albeit they are made to endure, being heavy, closely made and of attractive colorings.

Mr. Ruskin sums up the deteriorating effect of European control on the Indian rugs in the following manner—"Modern commercialism has laid its poisonous trade upon this useful industry since the days when I was a young man and to-day it is almost ruined as an art."

It may be added that to-day "this useful industry . . . as an art" is altogether ruined with no hope of its revival.

**Chinese Rugs.**—It is a matter for the historian to decide whether or not the Chinese are the original rug makers of the world; it is evident however that rugs were made in China a very long time ago and some of them of surpassing beauty; thus the white silk rug taken to Mecca as a covering for the holy shrine of Kaaba, antedated by hundreds of years the appearance of the great prophet of Arabia.

Chinese rugs form a distinct type, their designs consist of all kinds of odd geometrical devices, all imaginable curves and angles and many quaint configurations of the Swastika or the lotus flower which are distributed with unique formations on fields of yellow, blue, red, fawn, gold, and tan in all their exquisite shades marvelously blended.

Chinese mode of ornamentation may be called the Kaleidoscope of texture. Generally of long, soft wool or silk or camel's hair these rugs while not made as fine as some Persian rugs, still they reveal masterly skill in texture with iridescent sunset colors and magnificent sheen. They are among the most valuable of all Oriental rugs and among the rarest on the

## RUGS—RUISDAEL

European or American market; and they command highest prices.

**Kilims.**—Kilims, while products of the Orient, are not rugs, for they possess no pile and their mode of construction is different.

Kilims resemble the Kashmir or Shemakha rugs and are made in the same manner, that is on the flat stitch plan, with this difference however that while the loose ends of the yarn are left on the back of Kashmir rugs, in Kilims they are wound around the woof, and in changing the yarn to change the color also a separate warp thread is taken up, thus leaving a small oblong open space between the two stitches. Kilims thus made present the open work effect in texture.

Kilims are of lighter weight, often both sides made alike and are not appropriate for floor coverings. They are the tapestries of the Orient, and in whatever district made, they follow the usual rug pattern of that district. The finest Kilims are made in Sehna, where the finest rugs are made, in Persia; and also in Bokhara. Small Kilims made in Turkey are often called Kiz-Kilim, woven by the hands of Turkish maidens for purposes of dowry or devotion, or for presents to their marriageable friends and relations, they are therefore, highly decorative and often with unusually beautiful designs. Kilims are made also in Caucasia and Kurdistan known as Shirvan and Kurd Kilims respectively.

In the Orient their use is manifold—as rugs, hangings both for doors and walls, and for tents, as mantles by day time and covering by night for travelers; made for bags and covering for bags, and also for covering of the person; they serve for other conveniences entirely unknown in civilized communities.

B. PESHMALYAN.

**Rugs, Weaving of.** The commerce in Oriental rugs, especially those from Persia, Russia and Turkey, is very considerable in the United States. A few come from India and China, and some are woven in Afghanistan and Beluchistan. While there is a large production of rugs of various kinds in America the imported rugs continue to hold high favor among American buyers. Many of the costly Eastern rugs are as simply woven as a Navajo blanket, or even a rag carpet. The process is in many cases, almost identical, the variation being only in closeness or fineness of warp and arrangement of color. The Navajo blanket is a product of Indian manufacture. The manufacture of rugs in the United States is an industry of considerable importance. A great variety of weaves is produced,—woolen, cotton, and grass rugs, made in some cases after European models and methods and in others after original designs and methods of construction, both as to the machinery used, the dyeing of the fabrics, and the designs. Grass rugs for the country house have won recent prominence in our domestic commerce. Some of these are made of tough fibres and others of less durable material. Some have their colors woven into the mesh and some have stencilled designs in fast colors.

Another phase of the weaving of rugs in the United States is their manufacture in the home. Rag carpets have been made and used in farm houses for many generations, but of late there has been a general demand, especially in country houses, for home-made piazza rugs,

bedroom rugs and rugs for general use. An authority on the home weaving of rugs is Mrs. Candace Wheeler, whose recent work on 'How to Make Rugs' is a practical hand book. The Onteora rug, the Lois rug, the Isle La Motte rug, the Lucy rug and other home-made designs are described. The pattern, the dyeing, and braiding the fringe of the border all are featured and described. This writer states that "the cumbrous old woollen loom is still doing a certain amount of work in every country neighborhood, and it is capable of a greatly enlarged and much more profitable practice. I find very little, if any difference in the rugs woven upon these and the modern steel loom. It is true that the work is lighter and weaving goes faster upon the latter, and where a person or family makes an occupation of weaving, it is probably better to have the latest improvements, but it is possible to begin and to make a success of rag-rug weaving upon an old fashioned loom." In the matter of pattern and coloring it is stated that the Onteora rug is made by using a proportion of a half pound of blue rags to the two and a half white required to make up the three pounds of cotton filling required in a six foot rug. The side border in the Lois rug is made upon the same blue warp, is separately woven and afterward added to the plain white rug with blue ends. And she describes further details of her method. Many of the rugs described by Mrs. Wheeler are washable. Her work is also the building up of neighborhood industries in domestic rug making, a work which has taught both economy and art.

The larger subject of the domestic manufacture and commerce in rugs made in the United States may be broadly considered under the general subject of Carpets, (q.v.). The principal varieties of carpets now in use are the Turkey, the Axminster, the Brussels, the Wilton, the Venetian, the Dutch, the Kidderminster or Scotch, the Whytock's tapestry and velvet pile, and the printed felt carpet. Generally speaking, rugs, though made in England or the United States, follow somewhat these same designations and are similar in appearance though made on the most modern looms. A very beautiful fabric has also been introduced, called the Patent Wool Mosaic.

**Ruhmkorff, room'kôrf, Heinrich Daniel,** German inventor: b. Hanover 1803; d. Paris 21 Dec. 1877. He removed to Paris in 1839, where he continued to reside. In 1851 he invented the induction coil which bears his name.

**Ruisdael, rois'däl, or Ruysdael, Jacob van,** Dutch painter: b. Haarlem 1626; d. there 1682. He was the son of a painter, and probably studied art under his father and an uncle, who was also a painter. In 1648 he entered the guild of his native city, and some nine years later settled in Amsterdam, where he received citizen rights in 1659. He appears to have traveled throughout his native country and in parts of Germany and Switzerland. Ruisdael was not much appreciated during his lifetime, but is now ranked among the greatest of the Dutch painters of landscape. His pictures, comprising well-chosen forest, waterfall, shore, mountain, and similar scenes, are often of a melancholy, but always of a deeply poetical character. The figures in them were painted by Berchem, Van de Velde, Van Ostade, Wouwerman, Lingelbach, and others. All the chief European

## RULE BRITANNIA—RULES OF THE ROAD

galleries contain examples of his work, the number in the National Gallery being 12. Consult: Michel, 'Jacob Van Ruysdael et les Paysagistes de l'Ecole de Harlem' (1890).

**Rule Britannia**, the national song of Great Britain, the joint production of James Thomson and David Mallet, first performed before Frederick, prince of Wales, at Cheltenham House, 1740. See NATIONAL SONGS.

**Rules of Faith**, the phrase-worn *regula fidei* of polemical theology is the term applied to what is considered the code from which the Christian faith is to be derived, and has been in use since the 2d century. The items of the creed differ in the various sects. The Reformers held that the Scriptures alone could be safely accepted as a rule of faith. Roman Catholics hold that the testimony of the Church is the true rule of faith, regarding the Church as the vital and infallible organ of the teachings of Jesus Christ under the guidance of the Holy Ghost, while they look upon the Bible as the divinely inspired word of God to be interpreted by the Church. Protestants acknowledge the authority of Christ, his apostles, and all inspired writers, but deny that any doctrine not contained in the Scriptures has any binding authority. Certain members of the English Church admit what they call the consent of the fathers as authoritative interpretation of the Scriptures.

**Rule Nisi, nisi, or Rule to Show Cause**, in English and United States law, an order granted by the court on an interlocutory application (formerly always *ex parte*), directing the party opposed to the applicant to do or abstain from some act unless (*nisi*) he can show cause why the order should not be obeyed. If cause is shown, the order is "discharged," otherwise it is made "absolute."

**Rule of Three**. See PROPORTION; ARITHMETIC; ARITHMETIC, HISTORY OF.

**Rules of the Road**, the official designation of regulations adopted by national or international authorities for the management of vessels in storms, fogs, or other danger. Under act of the United States Congress, in 1896, the rules already established were considerably changed to comport with the schedule to be observed by vessels of all civilized nations on and after 1897. These rules apply also to inland waters, excepting the Great Lakes, for which a special act has been devised. The following is a synopsis of the new rules: "Vessels are in the first place cautioned against showing any other lights than their distinguishing ones in such a way as to permit any possibility of confusion. An additional white light is, however, given to a steam vessel under way to be carried at least 15 feet lower than the one now provided for, and forward of its vertical line. A vessel which is towing another vessel or barge is also allowed a small white light to be carried aft, and in such a position that it shall not be visible forward of the beam, which may be used for the towing vessel to steer by. The following regulations are also provided for small vessels:

"1. Steam vessels of less than 40 tons shall carry (a) in the fore part of the vessel, or on or in front of the funnel, where it can best be seen, and at a height above the gunwale of not less than nine feet, a bright white light

constructed and fixed as prescribed in article two (a), and of such a character as to be visible at a distance of at least two miles. (b) Green and red side lights constructed and fixed as prescribed in article two (b) and (c), and of such a character as to be visible at a distance of at least one mile, or a combined lantern showing a green light and a red light from right ahead to two points abaft the beam on their respective sides. Such lanterns shall be carried not less than three feet below the white light.

"2. Small steamboats, such as are carried by seagoing vessels, may carry the white light at a less height than nine feet above the gunwale, but it shall be carried above the combined lantern mentioned in subdivision one (b).

"3. Vessels under oars or sails of less than 20 tons shall have ready at hand a lantern with a green glass on one side and a red glass on the other, which, on the approach of or to other vessels, shall be exhibited in sufficient time to prevent collision, so that the green light shall not be seen on the port side nor the red light on the starboard side.

"4. Rowing boats, whether under oars or sail, shall have ready at hand a lantern showing a white light which shall be temporarily exhibited in sufficient time to prevent collision. Additional regulations are provided for pilot vessels on duty at their stations as follows: On the near approach of or to other vessels they shall have their side lights lighted, ready for use, and shall flash or show them at short intervals, to indicate the direction in which they are heading, but the green light shall not be shown on the port side, nor the red light on the starboard side. A pilot vessel of such a class as to be obliged to go alongside of a vessel to put a pilot on board may show the white light instead of carrying it at the mast-head, and may instead of the colored lights above mentioned, have at hand, ready for use, a lantern with a green glass on the one side and a red glass on the other, to be used as prescribed above. A vessel in or near a fair-way, when aground, is required to carry in addition to it, the two red lights which signify a vessel not under control but not desiring assistance. A steam vessel under sail only, but having her funnel up, shall carry forward where it can best be seen, one black ball or shape, not two feet in diameter.

"The manner of fog signaling is also more definitely fixed as follows: Article 15. All signals prescribed by this article for vessels under way shall be given: (1) by "steam vessels" on the whistle or siren. (2) By "sailing vessels" and "vessels towed" on the fog horn. The words "prolonged blast" used in this article shall mean a blast of from four to six seconds' duration. (a) A steam vessel having way on her shall sound, at intervals of not more than two minutes, a prolonged blast. (b) A steam vessel under way, but stopped, and having no way on her, shall sound, at intervals of not more than two minutes, two prolonged blasts, with an interval of about one second between. (c) A sailing vessel under way shall sound at intervals of not more than one minute, when on the starboard tack, one blast; when on the port tack, two blasts in succession, and when with the wind abaft the beam, three blasts

## RULING MACHINES—ROMANIA

in succession. (d) A vessel when at anchor shall, at intervals of not more than one minute, ring the bell rapidly for above five seconds. (e) A vessel when towing a vessel employed in laying or in picking up a telegraph cable, and a vessel under way, which is unable to get out of the way of an approaching vessel through being not under command, or unable to maneuver as required by the rules, shall instead of the signals prescribed in subdivisions (a) and (c) of this article, at intervals of not more than two minutes, sound three blasts in succession, namely, one prolonged blast followed by two short blasts. A vessel towed may give this signal and she shall not give any other. Sailing vessels and boats of less than 20 tons gross tonnage shall not be obliged to give the above-mentioned signals, but, if they do not, they shall make some other efficient sound signal at intervals of not more than one minute.<sup>5</sup> See COLLISION.

**Ruling Machines**, in blank-book manufacture and bookbinding, are instruments used for ruling paper, metal, etc. The first machine of this kind was invented by a Dutchman, resident in London, in 1782, and was subsequently greatly improved by Woodmason, Payne, Brown, and others. F. A. Nobert devised a ruling machine in 1845 for the production of microscopical test plates, diffraction gratings, and micrometers, etc., and more recently Benjamin Day, a New York artist, patented one for use by artists.

**Rum**, a distilled liquor obtained from the fermented juice of the sugarcane or molasses. Rum owes its flavor to a volatile oil and butyric acid, a fact which has been taken advantage of to prepare a butyric compound called essence of rum to enable the spirit-dealer to manufacture a fictitious rum from malt or molasses spirit. The color is usually imparted after distillation by adding burnt sugar or caramel.

**Rum, Romanism, and Rebellion**, in American political history; at a meeting of clergy, in which all denominations were supposed to be represented, held in the Fifth Avenue Hotel, New York, during the Presidential campaign of 1884, in the interest of the Republicans, Rev. R. B. Burchard described the Democrats as the party of "Rum, Romanism and Rebellion." This remark was unfortunate for the Republicans, and aided in a great measure to win the election for the Democrats.

**Rumania**, roo-mă'ni-ă, or Roumania, a kingdom of southeastern Europe, bounded by Austria-Hungary, Russia, the Black Sea, Bulgaria, and Servia. Area, 50,720 square miles. It comprises the provinces of Moldavia and Wallachia, prior to 23 Dec. 1861, Danubian principalities; to these have been added the province Dobrudja on the Black Sea. The principal towns are Bucharest, the capital; Jassy, Galatz, Braila, Botosai, Ploësti, Craiova, Berlad, Focșani.

**Topography**.—The surface consists mainly of undulating and well watered plains of great fertility: from the Carpathian Mountains on the north and west borders, where the summits range from 2,600 feet to 8,800 feet, they gradually slope downward to the river Danube which for 595 miles flows through Rumanian territory, and forms the major portion of the southern

boundary with Bulgaria. The entire kingdom is in the basin of the Danube, the chief Rumanian tributaries of which are the Alt or Aluta, the Arjish, Jalomnita, Buzeo, Sereth, Berlad and Pruth, the last forming the eastern boundary with Russia. The Danube forms a number of marshy lakes as it approaches the alluvial region of the Dobrudja, mostly a land of steppes and marshes, unhealthy and uncultivated, through which the Danube discharges itself into the Black Sea by the Saint George, Sulina, and Kilia channels.

**Geology, Natural Resources, etc.**—In the region of the Carpathians, the geology is of the Tertiary period practically completed at the end of the Miocene period, and almost entirely composed of primitive rocks. The kingdom possesses considerable mineral wealth; rock-salt abounds in the vicinity of the Carpathian Mountains, and the salt mines of Wallachia are apparently inexhaustible. Petroleum and asphalt are abundant; a great quantity of saltpeter is produced, chiefly in the northern part of the country; sulphur is found in more limited quantities. The only metal of importance is copper, which has been worked to some extent; gold is washed from the sands of several streams. About one sixth of the surface is covered with forests of oak, fir, beech, and other valuable timber trees.

The fauna includes stags, wild boars, bears, wolves, foxes, wild goats, hares, and martens; while fish abound in the rivers. The climate is subject to greater extremes than at the same latitude in other parts of Europe; the summer is hot and rainless; the winter, sudden and severe, the Danube and its tributaries being regularly frozen for about six weeks; there is almost no spring, but the autumn is long and pleasant. Rumania is an essentially agricultural and pastoral state, fully 70 per cent of the inhabitants being directly engaged in husbandry. The chief cereal crops are maize, wheat, barley, rye, and oats; tobacco, hemp, and flax are also grown; and wine is produced on the hills at the foot of the Carpathians. Cattle, sheep, and horses are reared in large numbers.

**Manufactures, Commerce, etc.**—Since the passing of the law in 1887 for promoting national industries, some progress has been made in manufactures, chiefly along the line of domestic commodities. Trade is fairly active, but is almost entirely in the hands of foreigners; the internal trade is chiefly carried on by Jews, who are subject to certain disabilities. The chief exports are grain (especially maize), cattle, timber, and fruit; the chief imports, manufactured goods, coal, etc. Germany, Great Britain, and Austria-Hungary appropriate by far the greatest share of the foreign trade, the bulk of which passes through the Black Sea ports. In 1901 the exports were valued at \$70,766,175, the imports at \$58,487,172; in 1900 and 1901, the value of the exports for the first time exceeded that of the imports. In 1902 there were 2,295 miles of state railway, 4,344 miles of telegraph lines, and a rapidly extending telephone system. The government monopolizes also salt and tobacco. The French decimal coinage has been introduced, the franc being called *lew* (pl. *lei*), the centime *bari*. The metric system of weights and measures has also been officially recognized, but a diversity of local standards is still common.

## RUMANIA

**Government.**—Since 1881 the ruler of Rumania has had the title of king, in accordance with the decision of the Rumanian Parliament. Previously the title was prince, or in Rumanian *Domnu* (L. *dominus*, lord). The present ruler was elected by the people, but the dignity is hereditary. There are two legislative houses, a senate of 120 members elected for eight years, and a chamber of deputies of 183 members elected for four years. The members of both chambers are chosen by indirect election, the first voters choosing electors, and these in their turn the deputies. A deputy must either belong to a learned profession, to a military or civil service, or have an annual income of about \$2,000, and must be 25 years of age. All citizens of full age and paying taxes are electors. The sovereign has a suspensive veto over all laws passed by the two chambers. The executive is in the hands of the sovereign assisted by a council of seven members, the heads of the departments of the interior, of finance, of war, of foreign affairs, of justice, of agriculture, commerce, and public works, and of public instruction and worship. For purposes of local government Wallachia is divided in 17, Moldavia into 13, and Dobruja into two departments, each administered by a prefect, a receiver of taxes, and a civil tribunal. Judges are removable at the pleasure of the superior authorities. The legal codes are founded on the civil law and customs of the two provinces; but though several reforms have been effected in the system of jurisprudence much yet remains to be done, especially in the administration of the law, which is said to be very unsatisfactory and corrupt. The budget estimates for 1909-10 were £17,427,413 revenue, expenditure, £18,039,907. The public debt in 1909 amounted to £59,310,089.

**Army and Navy.**—The military forces of Rumania are divided into five classes: (1) the permanent army, with its reserve; (2) the territorial army, with its reserve; (3) the militia; (4) the civic guard; and (5) levies *en masse*. Every male inhabitant, from the age of 21 to 46, must serve three years in the permanent army in active service and five years in its reserve, or five years in the territorial infantry and three years in its reserve. The active service in the cavalry of the territorial army lasts four years, and is followed by four years in its reserve. Whether a young man enters the permanent or the territorial army is determined by lot. Those who for some sufficient reason have not been subjected to the conscription form part of the militia, and those who have finished their term in the permanent or the territorial army also enter the militia till the age of 36. After this age, in the country they enter the levies *en masse*, in the towns the civic guard. The total strength in times of peace of the permanent army is 60,000 men and 3,280 officers, with 390 pieces of ordnance. The territorial army has a total strength of 72,000 men. The militia has a total strength of 33,000 men. The effective force of the civic guard and the levy *en masse* is not definitely fixed; but altogether Rumania can put into the field about 200,000 men. The navy is insignificant, there being only one armored cruiser of any consequence.

**Ethnology and Population.**—The Rumanians claim to be the descendants of a colony of Romans located here by the Emperor Trajan, and

call themselves *Romeni*; hence the name of Rumania, which is now universally adopted by the natives as the name of the united principalities. The race is, however, a mixed one, being modified by Greek, Gothic, Slavic, and Turkish elements. This mixture makes itself apparent in their language, three fourths of the words of which, however, are almost pure Latin; among words in common use are, *apa* (L. *aqua*), water; *pane* (L. *panis*), bread; *alby* (L. *albus*), white; *negrw* (L. *niger*), black; and so on. The conjugations also of the verbs, which are four in number, correspond exactly to the four conjugations in Latin. For a long time Greek was the language spoken by the court and the upper classes; but latterly this language has been largely superseded by the French. The population of Rumania, according to the latest census, was 6,300,000, among whom the Rumanians proper numbered 5,500,000. The Rumanians are in general strong and stoutly built, with black hair, brilliant eyes, and a complexion similar to that of the Italians. Besides the Rumanians proper there are about 300,000 Jews, 200,000 Gypsies, 85,000 Slavs, besides Germans, Magyars, Greeks, etc. There are also large numbers of Rumanians inhabiting Hungary, Transylvania, Bessarabia, and elsewhere.

**Sociology.**—Since the introduction of railways great changes have taken place in the condition of the people. The peasants were never, properly speaking, serfs, but being compelled to work gratis for the proprietor a certain number of days every year they became fixed to that part of the country in which they were born. They are now not only perfectly free, but each head of a family received during the late Prince Couza's reign a small portion of land, of which he became absolute proprietor, the landlord having been compensated by receiving bonds bearing 10 per cent interest. Their dwellings are generally of a wretched description. Many of the towns are merely agglomerations of large houses, the residences of the boyards, surrounded by the huts of their dependants. The streets are ill paved, or, as is most generally the case, not paved at all, and are usually filthy; the roads, of which there are too few, are in most cases in a wretched state. Agricultural labor, the chief employment of the inhabitants, is cheap, as most of the laborers are so poor that they engage for work to be done three years afterward, in order to obtain advances of money. More than three fourths of the population are peasants. Handicraftsmen are comparatively few in number, as the peasant usually builds his own house, and makes his own furniture and other utensils. In Moldavia there are about 3,000 boyards, besides an extensive lower nobility; in Wallachia they are still more numerous, every twenty-eighth man being a nobleman. There is no native middle class, and the higher ranks of society have only the law open to them as a profession. The commerce of the country is in the hands of the Jews and foreigners. The staple food of the inhabitants is maize; the common beverage is wine, which is produced in great quantities though mostly of inferior quality. This, however, is owing altogether to the manner in which it is made, and, as already stated, some good wine is also produced. The common people are good-humored, sober, and cleanly; murder and robbery are almost unknown.

## RUMANIAN LANGUAGE AND LITERATURE

**Religion and Education.**—The established religion is that of the Greek Church, to which about 97 per cent of the population belongs. At the head of the clergy are the metropolitan archbishops of Moldavia and Wallachia, the latter of whom is primate of Rumania. Each bishop is assisted by a council of clergy, and has a seminary for priests. In 1863 the national finances were so low that the government was compelled to appropriate the estates of the monasteries, whose revenues amounted to about a third of that of the state, allowing in return a sum of about £700,000 for the support of the religious communities. It was determined that the balance should be devoted to the support of schools, hospitals, the relief of the poor, etc. Rumania possesses 4,000 elementary schools, 34 high schools, eight normal schools, and two universities, besides other special schools. Education is compulsory, but is still very backward.

**History.**—Rumania formed an important part of the Dacian territory which was conquered by Trajan and formed into a Roman province in 106 A.D. It became the battle-field of the Goths, Huns, Bulgarians, Magyars, and Poles, who in succession held for a more or less lengthened period possession of the country. All these races left some traces of themselves among the Romanized Dacian inhabitants, thus contributing to form that mixed people who in the 11th century were converted to the Christianity of the Greek Church. About that epoch the Kumans, a Turkish tribe, established in Moldavia an independent kingdom. Two centuries later it fell into the hands of the Nogai Tartars, who so desolated the country that only in the mountains and forests was left any trace of the native population. Toward the end of the 13th century Radu Negru of Fogarash, a petty Transylvanian chief, took possession of part of Wallachia, divided it among his boyards, founded a senate of 12 members and an elective monarchy, and in the course of time conquered the whole province. About the middle of the following century Bogdan, a Hungarian chief, made a successful attempt to re-people Moldavia. Struggles for the ruling power, civil and foreign wars, and invasion by the Tartars induced the Rumanians in the beginning of the 16th century to place themselves under the protection of the Sublime Porte, and the boyards were gradually deprived of their power to elect their own ruler, whose office was bought and sold at Constantinople. Woiwodes of various nationalities were now successively appointed, but their rule proved inefficient in establishing peace and subjection to the sultan, as the boyards never lost an opportunity of making known their dissatisfaction. One of the most distinguished foreigners was Basil Lupulo, a Greek of Epirus, who promoted civilization and learning, but was deposed in the middle of the 17th century. From 1732 to 1822 the country was governed, or rather misgoverned, by Fanariot princes, who merely farmed out the revenues, enriching themselves and impoverishing the land. A considerable number of the boyards, through intermarriage with the Fanariots, were more than half Greek by descent; the court language was Greek, and the religious and political sympathies of the country lay in the same direction. In 1802 Russia succeeded in establishing a sort of protectorate over the principalities, and in 1821 a desper-

ate struggle to throw off entirely the Russian authority almost desolated the country. The sultan was compelled by Russia to evacuate the provinces from which he had expelled the Greeks years later to allow them to return to their native land for life. In 1833 Russia took military possession of the provinces, but was compelled in 1846 to retire, Turkey having received the assistance of France and England. In the Treaty of Paris at the close of the Crimean war in 1856 it was agreed, among other things, that the principalities of Moldavia and Wallachia should continue to enjoy, under the suzerainty of the Porte and under the guarantee of the contracting powers, the privileges and immunities of which they were in possession; and that no exclusive protection should be exercised over them by any of the guaranteeing powers. The Porte engaged to preserve to the principalities an independent and national administration. In 1858 the principalities were united under one ruler, Colonel Couza, who took the title of Prince Alexander John I. In 1861 Moldavia and Wallachia were formally brought under one administration. A revolution which broke out at Bucharest in February 1866, forced Prince Alexander to abdicate, after which the representatives of the people elected as ruler Charles, son of the late Prince Charles of Hohenzollern-Sigmaringen. In the Russo-Turkish war of 1877-8 the principality sided with Russia, but in spite of the important services which it rendered in that war, it was compelled at the close of the war to retrocede the portion of Bessarabia which it acquired at the conclusion of the Crimean war, and to receive in exchange the Dobrudja. Early in the war the principality proclaimed its independence of Turkey, and its independence was recognized in the Treaty of Berlin, July 1878. As already stated it became a kingdom in 1881, Prince Charles becoming king as Charles I. His wife is well known as a writer under the pseudonym Carmen Sylva. His nephew and heir, Prince Ferdinand, was married in 1893 to Princess Marie, daughter of the late duke of Saxe-Coburg-Gotha.

Consult Laveleye, 'The Balkan Peninsula' (1887); Samuelson, 'Rumania, Past and Present' (1882); Walker, 'Untrodden Paths in Rumania' (1888).

**Rumanian Language and Literature.** The racial language, Rumanian or Wallachian, is of the Romance type (see ROMANCE LANGUAGES) derived from the Latin, but with many Slavonic, and some Greek, Turkish, and Albanian words. The number of Latin roots is variously estimated at more or less than half of the total, the next greatest element being Slavonic, according to some authorities almost equaling the Latin. The majority of the population speak what is practically the same language—the Daco-Rumanian—throughout the kingdom, in Transylvania, in the Banat, and other parts of Hungary, Bukowina, and Bessarabia. The Macedo-Rumanian, spoken south of the Danube and among the Balkans and Pindus, is largely modified by Greek; and the Istro-Rumanian, spoken in Istria and Croatia, has been much Slavonized.

The first Rumanian book, a psalter, was printed in 1577, but Rumanian literature practically dates from the chronicles of the 17th century, which are the earliest specimens of its national literature. Greek was long the language

## RUMELIA — RUMINANTS

of the educated and aristocratic classes, but has been supplanted by French. In matters of general culture, little progress was made until the 19th century, when a popular Rumanian literature arose, the most interesting portion being the songs. Of these Basile Alecsandri (1821-90), one of the most notable of native poets and a patriotic and influential journalist, made a valuable collection (1866). Other distinguished names are Konstantin Negruzzi (1806-68), author of verses, plays, and historical studies, in prose and verse; Jakob Negruzzi (1843-), son of the former, author of poems, sketches, and tales widely read; Grigore Alecsandrescu (1812-86), poet and political leader; Dimitrie Bolintineanu (1826-72), poet and novelist; and Michael Eminescu (1849-89), the great lyric poet of Rumania. German translations have been made by Kotzebue, Schott, Krennitz, Rudow, and others, including 'Carmen Sylva' (q.v.), Queen of Rumania, herself an accomplished poet, novelist, and dramatist. Dora D'Istria (q.v.) pen-name of Elena Ghica (1828-88), wife of a Russian prince, is the author of Rumanian travel-sketches, and of historical and literary studies of great value, mostly written in French. Among authorities on the language are Hasden, Gaster, Titkun, and Franz von Miklosich, the latter the founder of Slavic philology, and author of 'Comparative Grammar of the Slavic languages,' and 'Etymological Dictionary of the Slavic languages.' There are histories of Rumanian literature by Cipariu, Densusianu, Gaster, Popfii, and Philippide. The great dictionaries are those of Codrescu (1875), Lawrianu and Massimu, 'Dictionariulu Limbei Romane' (1876-9); Hasden, 'Etymologicum Magnum Romanum' (1885-92); and there are standard chrestomathies by Pompiliu, and Gaster (1891). Consult Warner, 'Library of the World's Best Literature' (1899).

**Rumelia**, roo-mé'li-ə, Eastern, Turkey in Europe, a province established, with administrative autonomy, by the treaty of Berlin, 1878, but now united with Bulgaria, and known also as southern Bulgaria. It is bounded on the north by the Balkan Mountains, on the east by the Black Sea, on the south by a line beginning at Cape Seityn about lat. 42° 30' N., and proceeding west-southwest to the Rhodope Mountains, and on the west by the watershed between the Maritza and the Karasu. Originally it was arranged that the province was to be under the direct political and military authority of the sultan, but it was to be administered by a Christian governor-general appointed for five years by the Porte, subject to the approval of the European powers. This arrangement took effect and continued for a few years, but in 1885 the government was overturned by a popular movement and a union with Bulgaria carried out, in which the Porte has acquiesced. The capital is Philippopolis. The area is 13,700 square miles. Pop. about 1,200,000. See BULGARIA.

**Rum'ford, Count.** See THOMPSON, BENJAMIN.

**Ruminants**, herbivorous split-hoofed animals, characterized especially by chewing the cud; they include the camels and llamas, giraffes, deer, pronghorns, antelopes, sheep, goats, and ox-tribe, and hence nearly all of the mammals most economically important to man. All of

these, except the camels and giraffes, are represented on the continent of North America, and two—the pronghorns and musk ox—are peculiar to it. In most no incisor or canine teeth exist in the upper jaw, the place of these teeth being supplied by a hardened or callous pad of gum, against which the lower incisors bite. Six incisors exist in the lower jaw. Canines are always present in the lower jaw, and are usually inclined forward and toward the incisors, which they nearly resemble in form. The general number of lower canine teeth is two. The molar and premolar teeth number six on each side of each jaw, and are selenodont, that is, possess flattened crowns topped by two double folds of enamel of an irregular crescentic shape. The stomach is divided into four compartments. (See DIGESTION.) In the process of feeding the herbage is rapidly cropped off by the lower incisors pressing against the hardened gum of the upper jaw. The food mixed with saliva is swallowed into the paunch, where it is simply moistened and then passes into the reticulum or second compartment. The aperture of the gullet now closes, and the mass of food contained within the gullet is propelled upward into the mouth by a muscular action similar to vomiting. Mastication of the food is now effected by a kind of rotatory motion, the lower jaw thus giving a first stroke, for example, from left to right, and the rotary motion continuing persistently afterward from right to left, or in the opposite direction to the first movement of the jaws. This is "chewing the cud." In the camels the motion of the jaws is said to be simply one from side to side. After being thus thoroughly masticated and remixed with saliva, the food is again swallowed, and passes at once on into the third stomach, and is assimilated.

Two distinct divisions of the ruminants may be recognized, according to nature of the horns, known respectively as the "solid-horned" and the "hollow-horned."

The first section includes the giraffe (although no external antlers arise), the deer and pronghorns; and the other the antelopes and the sheep, goat, and ox tribes. The antlers of deer consist of nearly homogeneous bony tissue, lighter and more porous in structure than ordinary bone; are generally much branched or forked, and are shed and renewed every year. (See ANTLEERS; DEER.)

The horns of the hollow-horned ruminants are entirely different from the antlers of deer, in structure as well as in manner of growth. They are usually common to both sexes, as in our domestic cattle, are simple and not branched, and grow continuously throughout the life of the animal, though very slowly after it has reached maturity, and are never shed. They consist of a bony core—an elongated process from the frontal bone—covered with a sheath of horn. (See HORN.)

Technically speaking, the ruminant game animals of North America consist of three distinct families, two of which are represented by several genera, and some of the genera by numerous species. These families are: the pronghorns (*Antilocapridæ*); the deer (*Cervidæ*); and the sheep, goat, and ox tribes (*Bovidæ*). They are all "game animals," and some of them are rapidly approaching extermination. The pronghorns, though usually called the American

## RUMP PARLIAMENT—RUNCIMAN,

antelope, is not a true antelope, but is of a distinct family type, found only in North America, and peculiar in the fact that its horns are branched and are shed annually. (See *PANORAMA*.) The deer tribe consists in America of five genera, namely, the wapiti (*Cervus*); the small deer of the United States and Mexico (*Dama*, or *Odocoileus*); a Central American brocket (*Mazama*); the moose (*Alces*), and the caribou (*Rangifer*). These are separately described under their names. Altogether between 25 and 30 species of deer exist in North America, including Mexico. Of the ox and sheep tribes or horned ruminants, the most prominent native member is the almost extinct bison (q.v.). The mountain sheep (see *BIGHORN*) number five species, and the Rocky Mountain goats (q.v.) number two species; but of most of these species so few examples are known, and their range is so limited that it may well be doubted whether they will ultimately be regarded as distinct. The goats and sheep are mountain dwellers, their favorite haunts are the more inaccessible parts of the higher ranges, and they are exceedingly watchful and sagacious. They have been exterminated in the more accessible parts of their ranges, and survive in comparatively small numbers and greatly restricted areas. The musk-oxen, or musk-sheep, are a very distinct type, entitled to a distinctive name free from the implication of any such alliance; but the term musk-ox (q.v.) is not likely soon to be displaced. There are two species, the barren-ground and the Greenland.

The ancestors of the higher ruminants are mainly of Old World origin, and are comparatively scarce and late in appearance in the fossil beds of our own continent. The oldest forms definitely known were those of the family *Anthracotheriidae*, pig-like animals, with teeth approaching the selenodont shape, and a complete dentition; all the bones of the five-toed feet were free. The type-genus *Anthracotherium* (q.v.) begins in the Oligocene and continues down to the Pliocene, and is known from all parts of the world. Another early group was more sheep-like in its characteristics, and forms the family *Camotheriidae*, represented by *Camotherium*, which flourished in the Eocene and Miocene eras. They were small-sized, more delicate than modern sheep, the dentition was complete, and four toes reached the ground. Another large group was the family *Oreodontidae*, which was limited to North America, and whose remains have been found plentifully and usually in excellent condition in the Tertiary rocks of the eastern Rocky Mountain region. The oreodonts were ancestors of deer and antelopes, and some were horned, while all had five functional toes in front and four behind. Prominent genera are *Oreodon*, of the size of a small pig; *Mesoreodon*, larger and stouter; *Casorys*, *Agriocherus*, and most primitive of all *Protoreodon*. Another primitive family wholly European was *Anoplotheriidae*, represented by the long-known *Anoplotherium* (q.v.).

**Rump Parliament**, in English history, a name by which the remains of the Long Parliament was known after the expulsion of the majority of its members by the army of Cromwell, 6 Dec. 1648. It having been decided by a majority of the House of Commons that the con-

cessions made by Charles I. in the Treaty of Newport were a ground of settlement, Oliver Cromwell, who wished for the condemnation of the king, despatched two regiments under the command of Colonel Pride to coerce the House. In discharge of the resolution of the army that "none might be permitted to pass into the House but such as continued faithful to the public interests" Colonel Pride, whose regiment was stationed so as to block up all the entrances to the House of Commons, furnished himself with a list of the names of the members against whom the sentence of exclusion was passed, and as each approached prohibited him from entering. Forty-one members were placed under temporary restraint, and 160 ordered to their homes. Only 60 were admitted, all violent Independents, and these constituted the rump after the clearance wrought by Pride's purge, as it is called. This assembly, in conjunction with the army, brought about the arraignment, trial, and condemnation of Charles I. It was forcibly dissolved by Cromwell, 30 April 1653, for presuming to make a stand against certain demands of the army. Twice after this it was reinstated, but both times only for a brief period, and finally, on 16 March 1660, it solemnly decreed its own dissolution.

**Rumsey**, rûm'sl, James, American inventor: b. Bohemia Manor, Cecil County, Maryland, in 1743; d. London, England, 23 Dec. 1792. He was a mechanical engineer, and while engaged as the superintendent of a mill in Shepherdstown, Va., conceived plans for the application of steam to marine propulsion. In 1786 he exhibited a boat upon the Potomac which was propelled by means of a steam pump which forced a stream of water from the stern. The Rumsey Society, in which Benjamin Franklin was greatly interested, was established in Philadelphia in 1788, and later an organization of the same name in England, to further his invention, but he died while his experiments were incomplete. He wrote 'A Short Treatise on the Application of Steam' (1788).

**Rumsey**, William, American jurist: b. Bath, Steuben County, N. Y., 18 Oct. 1841; d. New York 16 Jan. 1903. He was educated at Williams College, volunteered in the Union army in April 1861, and was granted his diploma from the college in June. He served through the war, attaining rank of captain of volunteers in 1863, major in 1864, and brevet lieutenant-colonel in 1865, in which year he was mustered out of service. He was secretary of the United States legation in Japan in 1865-6, and in 1880-1901 served as judge in the seventh judicial district of the supreme court. He then resigned and engaged in law practice until his death.

**Runciman**, rûn'sl-mân, Alexander, Scottish painter: b. Edinburgh 1736; d. there 21 Oct. 1785. He was placed at 14 with some house-painters, who used to adorn the mantel-pieces of the houses which they painted with landscapes, of which many a specimen is still preserved in the houses of the Old Town of Edinburgh. He devoted himself entirely to this art; and acquired considerable local fame for his landscapes. In 1766 he visited Italy, where he met Fuseli, whose enthusiastic character matched aptly with his own. He spent five years in Rome, assiduously studying and copying the Italian masters; and in

## RUNEBOG—RUNNYMEDE

1771 returned with powers increased and taste improved. Just at that time he obtained the mastership of the Trustees' Academy; and thus secured in the means of subsistence he applied his leisure to historical painting. Among his best-known productions may be mentioned: 'Macbeth and Banquo,' in a landscape; a 'Friar,' in a landscape; 'Job in Distress'; 'Samson Strangling the Lion'; 'Figure of Hope'; 'Saint Margaret Landing in Scotland'; 'Christ and the Woman of Samaria'; 'Agrippina Landing with the Ashes of Germanicus'; and the paintings in Ossian's Hall at Penicuik. The work last mentioned was the *chef-d'œuvre* of Runciman. He was remarkable for candor and simplicity of manners, and possessed a talent for conversation. Among his associates were Robertson, Hume, Lord Kames, and Lord Monboddo.

**Runeberg, Johann Ludvig,** yō'hān lood'vig roo'nē-bērg, Swedish poet: b. Jacobstad, Finland, 5 Feb. 1804; d. Borgå 6 May 1877. He was educated at Wasa and at the University of Åbo. His first volume (1830) contained a number of lyrics and a long poem, 'Nights of Jealousy.' In 1832 appeared an epic written in hexameters 'Elgskytterne' (The Elk Hunters); in 1833 a second volume of lyrics, and in 1836 the idyl 'Itanna.' In 1837 he taught Latin literature at the university, became lector at the gymnasium of Borgå, where he remained until his death, being advanced to professor in 1844 and rector in 1847. His other works were the idyl 'Julqvällen' (Christmas Eve) and the epic 'Na donchda' (1841); Lyrics (1843); a romantic cycle, 'Kung Fjalar' (King Fjalar, 1844); narrative poems, 'Patriek Ståls Sägner' (Ensign Stål's Stories, 1848-60); a rhymed comedy 'Kan ej' (Can't, 1862); 'Kungarne på Salamis' (The King at Salamis, 1863). His collected works were published in 1876 and posthumous works in 1878-9.

**Runes,** the characters used in writing by the Teutonic tribes of northwestern Europe in early times. Three classes of runes are recognized, Anglo-Saxon, German, and Scandinavian, but the differences of form which distinguish them are no wider than the differences between the alphabets employed in very ancient times by various Greek peoples—between the Old Athenian alphabet, for example, and the Old Corinthian, or between the earliest Phœnician and the earliest Hebrew. The name Rune is significant of the use to which this manner of writing was first applied. In Anglo-Saxon *rūn* means secret, and *rūna* magician; and the knowledge of runes was confined to a small class—priests or sorcerers. For this reason, upon the introduction of the Christian religion the use of the runes was condemned as connected with heathenish superstitions. A poet of the 6th century, Venantius Fortunatus, tells of runes being written on tablets or slabs of ash (*fraxineis tabellis*), but there are extant numerous runes inscribed on memorial stones, rings, coins, etc., which have been found in Denmark, Norway, Sweden, Germany, and Iceland, and in Britain within the limits of the ancient kingdoms of Northumbria, Mercia, and East Anglia. The system of characters called runes gets the name Futhorc from the first six letters,

just as the Greek system is called Alphabet from the names of the first two letters, alpha and beta, A and B, or as we call our alphabet the A B C. The following examples show the agreements and differences between British and Norse runes:

Anglo-Saxon Runes.

Norse Runes.

What is the origin of this mode of writing? Is it derived from the Greek alphabet or from the Phœnician direct? Not improbably the Phœnician manner of writing was introduced into the Baltic countries by the enterprising Phœnician traders as early as the 6th century a.c.: but though the runes are in many instances identical with characters of the Phœnician alphabet they do not represent in Futhorc the same sound values as in the alphabet of the Phœnicians: on the supposition of their derivation from that alphabet, therefore, it would be only the idea of representing voice-sounds by arbitrary written characters that would have come from the Phœnicians, not the denotations of particular sounds. Yet, though original derivation from Phœnician sources be granted, in later times Greek characters were added to complete the system.

**Runjeet Singh,** rūn-jēt' sīngh. See RANJIT SINGH.

**Runkle,** rūn'kl, John Daniel, American mathematician: b. Root, N. Y., 11 Oct. 1822; d. Southwest Harbor, Maine, 8 July 1902. He was graduated from the Lawrence Scientific School at Harvard in 1851, and having been appointed to the staff of the 'American Ephemeris and Nautical Almanac' in 1849, continued with it until 1884. He was one of the promoters of the Massachusetts Institute of Technology and held the chair of mathematics there from the time of its foundation until his retirement shortly before his death with the exception of 1870-8 when he was president. He established the 'Mathematical Monthly' in 1859 and edited it until 1861, and published: 'New Tables for Determining the Values of the Coefficients in the Perturbative Function of Planetary Motion' (1856); 'Elements of Plane and Solid Geometry' (1888); etc.

**Runic Characters.** See RUNES.

**Runnymede,** rūn'ī-mēd, England, five miles east of Windsor, in Surrey, lying along the right bank of the Thames, is the celebrated meadow where the conference was held, 15 June

## RUNYON—RURAL HIGHWAYS

1215, between John and the English barons, in which the former was compelled to sign Magna Charta and the Charta de Foresta. (See JOURN.) Runnymede is now divided into several enclosures.

**Run'yon, Theodore**, American diplomat: b. Somerville, N. J., 25 Oct. 1822; d. Berlin, Germany, 27 Jan. 1896. He was graduated from Yale in 1842, admitted to the bar in 1846, and established a law practice at Newark, N. J. He became city attorney of Newark in 1853, city councillor in 1856, and at the outbreak of the Civil War went to the front as brigadier-general in command of the 1st brigade of New Jersey Volunteers. He arrived at Washington on 6 May, when the threatened invasion by the Confederates had thrown the city into great alarm, and promptly took efficient measures for its defense. After the defeat of the Union army at the first battle of Bull Run when the city was in danger of invasion, he closed all approaches, stationed cannon to avert the expected attack, and thereby saved the National capital, a service for which he received the personal thanks of President Lincoln and his cabinet. He was honorably mustered out of service in July 1861 and resumed his law practice. In 1863 he was elected mayor of Newark, served as chancellor of New Jersey in 1873-87, and in 1893 was appointed minister to Germany. He was raised to the rank of ambassador in that year and remained in office until his death.

**Rupēs**, roo-pé', in India, the name given a small silver coin. The value of this coin is nominally 50 cents, but owing to the depreciation of silver it has of late years varied between 30 and 40 cents. A rupee equals 16 annas;  $\frac{1}{4}$ ,  $\frac{1}{2}$ , and  $\frac{3}{4}$  rupee are also coined in silver. A lac of rupees is 100,000, and a crore 10,000,000 rupees.

**Ru'pert, or Robert, of Bavaria, PRINCE**: b. Prague 18 Dec. 1619; d. London 29 Nov. 1682. He was the son of Frederick V., elector palatine and titular king of Bohemia, by the Princess Elizabeth of England, daughter of James I., was educated at Leyden and early engaged in military service in the Thirty Years' war. During the civil war in England he had the command of a corps of cavalry, at the head of which he distinguished himself at the battle of Edgehill in 1642, at Chalgrove Field in 1643, and also at Marston Moor and at Naseby; but his impetuosity and imprudence contributed to the disastrous result of these latter engagements. In 1648 he was made commander of that part of the fleet which still adhered to Charles. Prince Rupert for some time carried on a predatory warfare against the English; but in an engagement with Blake, off the Spanish coast, he was worsted, and his whole squadron destroyed, with the exception of four or five ships, with which he escaped to the West Indies, where he supported himself by capturing English and Spanish merchantmen. Later he joined Charles II. at the court of Versailles, where his time was chiefly devoted to scientific studies till the Restoration, when he returned to England. In 1664 he was appointed with Monk, to the command of a fleet against the Dutch, and in the next war with Holland, in 1673 was made admiral of the fleet. Many useful inventions resulted from his studies,

among which are the invention of prince's metal, and although the discovery of the method of engraving in mezzotinto is not due to him, as has been erroneously supposed, he introduced the art into England. He also introduced the curious glass drops that have been named after him, Prince Rupert's drops. He was likewise one of the founders and the first governor of the Hudson's Bay Company, incorporated in 1670, and a founder of the Royal Society.

**Rupert's Land**, the former name of an extensive territory in Canada, conferred by Charles I. on Prince Rupert, transferred to the Hudson's Bay Company in 1670, and since 1870 included with the other parts of the Hudson Bay Territories in the Northwest Territories. The title is still retained to distinguish an Episcopal diocese; the see of the bishop of Rupert's Land is at Winnipeg. See NORTHWEST TERRITORIES.

**Rup'ia**, a skin disease, characterized by an eruption of small flattened and distinct bullae surrounded by inflamed areolæ, containing a serous, purulent, sanious, or dark bloody fluid, and followed by thick, dark-colored scabs over unhealthy ulcers. Three varieties of this disease are described, *Rupia simplex*, *Rupia prominens*, and *Rupia escharotica*. *Rupia simplex* commonly appears on the legs, sometimes on the loins or thighs, and seldom on other parts. The bullæ are not preceded by any inflammatory symptoms, vary from  $\frac{1}{4}$  inch to 1 inch in diameter, and contain at first a transparent serous fluid, which soon becomes turbid and purulent, and dries into scabs. The scabs are easily removed, displaying an ulcerated surface underneath, and several series of these scabs may follow before healing sets in. In *Rupia prominens* the bullæ are larger, the scabs thicker, and the ulceration deeper. The scab adheres firmly, and generally requires emollient applications to facilitate its removal. *Rupia escharotica* occurs chiefly in cachectic children and infants. It is commonly confined to the lower extremities, and begins by one or two red and livid spots, over which the cuticle is soon raised by the effusion underneath it of a serous fluid. The bullæ thus formed increase; the serum they contain becomes turbid, and of a blackish hue. A bloody and offensive sanies marks the surface of the sore, the edges of which are livid, but not very painful. Rupia is chronic, not dangerous, not contagious, but often very obstinate. It generally attacks persons debilitated by age, intemperance, bad living, or previous diseases, especially smallpox, scarlet-fever, and syphilis. The general treatment consists mainly in the administration of tonic decoctions, more especially those of cinchona, cascarilla, gentian, etc., with alkalies, a generous and nutritious diet, and warm salt water and alkaline baths. The local treatment consists chiefly of puncturing the bullæ early, and allowing the morbid secretion to escape; of poulticing in order to remove the scabs, and of applying lotions containing nitrate of silver or nitric acid, or any other slightly stimulating application.

**Rupture**, hernia (q.v.), especially abdominal hernia, to which the term rupture is most frequently applied in popular usage.

**Rural Highways**. See ROADS, IMPROVEMENT OF.

## RURIK—RUSH

**Rurik**, roo'rik, founder of the Russian monarchy: d. 879. Most writers consider him to have been a Varangian, of Scandinavian origin, though Kostomarov has endeavored to prove that he was a Lithuanian. It is recorded that he came to Russia about 862, accompanied by his brothers Sinaf and Truvor, in compliance with the request of Gostomisl, a leading personage of Novgorod. One of the brothers established himself at Belozersk, the other at Izborsk, while Rurik began by fortifying himself in the ancient town of Ladoga, at the present day a miserable village on the Volkhof. The Novgorodians soon repenting, rose in rebellion against Rurik, and at their head was one of their fellow citizens named Vadim, whose valor is celebrated in the ancient chronicles, and in Russian song. Rurik succeeded in establishing a dictatorship in Novgorod in 865, and is said to have killed Vadim with his own hand. His possessions were soon afterward greatly enlarged by the death of his brothers, whose principalities, since they died without issue, Rurik united to Novgorod. In order to secure himself and his descendants in their newly acquired territory, he invited various colonies of Varangians, on whose devotion he could count, to settle in the country. Rurik died after a reign of 17 years. The family of Rurik reigned in Russia till the death in 1598 of Feodor, son of Ivan the Terrible, when it was succeeded by the closely allied house of Romanoff.

**Rusby**, Henry Hurd, American botanist and educator: b. Franklin, N. J., 26 April 1855. He was educated at the University of New York, was engaged in botanical explorations and investigations under the Smithsonian Institution in 1880-96, has been professor of botany, physiology and materia medica in the New York College of Pharmacy since 1888, and professor of materia medica at Bellevue Hospital Medical College since 1897. He is a member of many scientific societies, was curator of the New York Botanical Gardens and in 1900-1 was a member of the committee which revised the botanical department of 'United States Pharmacopoeia.' His publications include: 'Essentials of Pharmacognosy' (1895); 'History of the New York College of Pharmacy' (1895); 'Morphology and History of Plants' (1899); 'Five Pamphlets on the Flora of Bolivia' (1893-1901); etc.

**Rush**, Benjamin, American physician: b. Byberry, near Philadelphia, Pa., 24 Dec. 1745; d. Philadelphia 19 April 1813. He was graduated from Princeton in 1760, from the University of Edinburgh in 1768, and became professor of chemistry at the College of Philadelphia in 1769. He was active in the pre-Revolutionary movements, and as member of the provincial conference of 1776 moved the resolution declaring the expediency of a declaration of independence, of which he was a signer in the following month. He was surgeon to the Pennsylvania navy in 1775-6 and in 1777 was appointed surgeon-general and later physician-general of the hospitals of the middle section. In 1778 he resigned and resumed his practice and his professorship at Philadelphia. He was a member of the convention which formed the constitution of 1780, established the first dis-

pensary in the United States in 1785, and in 1787 was a member of the convention which ratified the Federal Constitution. He became professor of theory and practice of medicine in 1789 and after the Medical College was merged in the University of Pennsylvania was appointed professor of the institutes and practice of medicine and of clinical practice. In the yellow fever epidemic of 1793 Rush instituted a new method of treatment for the disease which he used with great success, visiting from 100 to 120 patients daily. He was one of the founders of Dickinson College, an advocate of the abolition of slavery, was connected with various religious and scientific societies, and was treasurer of the United States Mint from 1799 until his death. He wrote: 'Medical Inquiries and Observations' (5 vols., 1789-98); 'Essays, Literary, Moral, and Philosophical' (1798); etc.

**Rush**, Richard, American diplomat: b. Philadelphia 29 Aug. 1780; d. there 3 July 1859. He was graduated from Princeton in 1797, was admitted to the bar in 1800 and engaged in practice at Philadelphia. In 1811 he was appointed attorney-general of Pennsylvania and in 1814-17 was attorney-general of the United States. He was temporary secretary of state under President Monroe in 1817 and was then appointed minister to England, a post he occupied until 1825 when he was recalled to become secretary of the treasury under President Adams. He was a candidate for the vice-presidency on the ticket with Adams in 1828 and in 1836 was appointed by President Jackson commissioner to obtain the legacy for the founding of the Smithsonian Institution which was then pending in the English chancery court, returning in 1838 with the entire amount. He was appointed minister to France in 1847 and remained such until 1851 when he was recalled at his own request and spent the remainder of his life in retirement. He published: 'Codification of the Laws of the United States' (5 vols., 1815); 'Narrative of a Residence at the Court of London from 1817 till 1825' (1833); 'Washington in Domestic Life' (1857); 'Occasional Productions, Political, Diplomatic, and Miscellaneous, including a Glance at the Court and Government of Louis Philippe, and the French Revolution of 1848' (published by his sons, 1860).

**Rush**, William, American sculptor: b. Philadelphia 4 July 1756; d. there 17 Jan. 1833. He was apprenticed to a carver and soon became known as a maker of figure-heads which won admiration in many ports in the world. He never worked in marble, confining himself to wood and clay, but gained a high reputation for his statues, busts, and ideal figures executed in these materials. He served in the American Revolution and was a member of the city councils of Philadelphia for more than a quarter of a century. Among the most admired of his ship carvings were: 'Genius of the United States'; 'Nature'; 'Indian Trader'; 'William Penn'; 'River God.' He also executed: 'Exhortation'; 'Praise'; busts of Linnaeus, William Barton, and Lafayette; statues of 'Winter,' 'Washington' (1814); etc.

**Rush**. Many plants growing in moist land having cylindrical stems are called rushes, al-

## RUSH MEDICAL COLLEGE--RUSHVILLE

though generally with a qualifying adjective; as the bulrush (*Typha*), flowering rush (*Butomus*), or scouring rush (*Equisetum*), and some sedges (*Carex*). The true rushes, however, are members of the grass-like family *Juncaceae*, containing about 200 species in the several genera, and distributed throughout the temperate zones. Some are destitute of leaves but have barren flower stems resembling leaves; some have leafy stems, the leaves rounded or somewhat compressed, and usually jointed internally; the foliage of others is very narrow, springing from the root. The round stems of the leafless species, sometimes bearing flowers, are popularly called rushes. The presence of this family in a pasture denotes bad drainage, and they are troublesome to farmers, since cattle will touch them only as a last resort. The common bog or soft rush (*Juncus effusus*) is found in wet places throughout the temperate world. It is a typical species, with glabrous tufts attaining perhaps four feet, springing from a stout rootstock, and bearing an inflorescence composed of many small greenish grass-like flowers. This species is cultivated in Japan for making mats, and with others is employed for the bottoms of chairs, baskets, coarse ropes for binding, etc. The stems of *J. conglomeratus* were formerly gathered by English farmers, and stripped of their green rind, leaving exposed a large pith with one even lengthwise rib of rind left to support it. This porous pith was then bleached and dried, and dipped in scalding grease, thus becoming the wick of a rude candle, or "rush-light," which gave a good, clear light, and, if two feet long, would burn nearly an hour. These dried rush-piths were also used in place of cotton for wicks in open lamps.

Rushes, with a few sweet herbs, were scattered before processions, and were strewn on stages in Shakespeare's time, and on the floors of houses before the advent of carpets. The strewing of rushes in the churches grew into a religious festival conducted with much pomp. These rushes on the floor generally became so filthy from overlong use that to order fresh rushes was a sincere mark of honor to a guest.

Scouring rushes are the hollow, jointed stems of the horsetail, *Equisetum hiemale*, the epidermis of which is impregnated with silica, and was formerly used for scouring metals. See DUTCH RUSH.

Bulrushes (*Typha*), or cat-tails, were somewhat employed in the place of true rushes, for mats and chair bottoms, and are also placed between barrel-staves.

Rush Medical College, located at Chicago, affiliated with the University of Chicago. It is one of the oldest educational institutions in the Northwest, having received its charter in 1837. The first lectures were delivered in 1843, and the first building erected in 1844; a larger building was erected on the same site in 1867; this was burned in the Chicago fire of 1871; and the present clinical building was erected in 1875. In 1887 the college became the Medical Department of Lake Forest University, retaining its autonomy; this relation was dissolved in April 1898, and in the same month the college was affiliated with the University of Chicago (q.v.). The government of the college is vested

in the "perpetual board of trustees" incorporated in 1837, of which the governor of the State, the lieutenant-governor, and the speaker of the house of representatives are members *ex officio*. The board has control of the financial affairs of the college and appoints the faculty; and delegates to the faculty the control of the educational work subject to the rules of the university and the approval of the trustees; by the terms of affiliation the board of trustees is composed of members not belonging to the teaching force of the college. In 1899-1900 the University offered courses corresponding to the work of the Freshman year of the Medical College, and since 1901 offers instruction in all of the courses of the first two years of the medical curriculum, in anatomy, neurology, embryology, physiology, physiological chemistry, chemistry, chemistry of medical drugs, toxicology, pathology, bacteriology and pharmacology. All the work of the first two years is offered at the university only, and the work at the college is clinical, that is, the work of the last two years of the medical course. Students who take the first-year courses matriculate and register both as students of Rush Medical College and as students of the university. Many of the courses of the Freshman and Sophomore years are required; the courses of the Junior and Senior years are all elective, a certain amount of work in each department being required for the degree of M.D. The university provides three fellowships to graduates of the college, and provides for granting the degree of B.S. to students who comply with the university requirements for that degree. The buildings of the college, distinct from those of the university, are the clinical building, Senn Hall and the laboratory building; the Presbyterian Hospital, adjoining the college, and the Cook County Hospital, opposite the college, afford material for the clinics. The library in 1910 contained over 21,000 volumes; the students in 1909-10 numbered 328, of whom 79 were specials and post-graduates. The college is open to women as well as men.

**Rush, Scouring.** See *Equisetales*, under FERNS AND FERN ALLIES; DUTCH RUSH.

**Rushforth, William Henry**, American inventor: b. Leeds, England, 11 July 1844; d. Rutherford, N. J., 21 Aug. 1892. He entered a railroad repair shop at 12 and at 19 had become a railroad engineer. He was chief engineer in charge of 13 stationary engines in 1874 and in 1878 came to the United States, where he became engineer in a silk factory at Camden, N. J. He was the author of numerous useful inventions, among them a fire-escape ladder, a series of automatic safety signals and a feed-water heater for utilizing the heat wasted in the smoke boxes of locomotives, the latter receiving a silver medal and a diploma at the Paris Exposition of 1887.

**Rushville, Ill.**, city, county-seat of Schuyler County; on the Chicago, B. & Q. railroad; about 53 miles northwest of Springfield, and 48 miles east-northeast of Quincy. It was settled 20 Feb. 1826 by Benjamin Chadsey, Levi Green, and Thomas Bair, members of a commission that selected a town site. It was incorporated as a village 10 May

## RUSHVILLE—RUSKIN

1837, and chartered as a city in April 1868. It is in an agricultural and coal mining region; the chief manufactures are a flour mill, machine shop, wagon works, harness shops, bottling works, and file factory. It has considerable trade in farm products. The principal public buildings are the county court-house and the jail. There are six churches, three public graded schools, and the Rushville Normal and Business College. The two banks have a combined capital of \$150,000, with \$700,000 deposits. The government is vested in a mayor and a council of six members, who hold office for a term of two years. Pop. (1800) 2,031; (1900) 2,292; (1910) 2,370.

EDWIN DIGSON,  
*Editor 'Rushville Times.'*

**Rushville, Ind.,** city, county-seat of Rush County; on Flat Rock Creek; and on the Cleveland, C. & St. L., the Cincinnati, H. & D., the Pittsburg, C. & St. L., and the Fort Wayne, C. & L. R.R.'s; about 40 miles east-southeast of Indianapolis, and 85 miles northwest of Cincinnati. It was settled in 1822, incorporated the same year, and chartered as a city in 1882. It is in a fertile agricultural region, and has considerable manufacturing interests. The chief manufactures are flour, furniture, machinery, agricultural implements, lumber, bent wood, drain pipe, clothing, clay-working machinery, and washing machines. There are nine churches, a high school, public and parish schools, two private schools, and a public library. The four banks have a combined capital of \$275,000. The government is vested in a mayor, a council of six members, elected every two years. The city owns and operates the electric light plant and the waterworks. Pop. (1910) 4,607.

**Rusk, Jeremiah McLain,** American agriculturist: b. Morgan County, Ohio, 17 June 1830; d. Viroqua, Wis., 21 Nov. 1893. He removed to Wisconsin in 1853, engaged in farming, became sheriff, and in 1861 was elected to the legislature. In 1862 he entered the Union army, was commissioned major, and promoted lieutenant-colonel in 1863. He commanded a regiment in Sherman's Meridian campaign and for services in the Atlanta campaign was brevetted colonel and brigadier-general in 1865. He was mustered out of service in that year and in 1866-70 served as bank-comptroller of Wisconsin. Elected to Congress in 1871 he remained there until 1877 and in 1882-9 was governor of Wisconsin. He was first secretary of the newly created Department of Agriculture under President Harrison in 1889-93.

**Rusk, Thomas Jefferson,** American politician: b. Camden, S. C., 8 Aug. 1802; d. Nacogdoches, Texas, 29 July 1856. He studied law, practised in Georgia, and in 1835 removed to Texas, where he took a prominent part in political affairs. He was a member of the convention which declared the independence of Texas in 1836, was its first secretary of war, and after the disablement of General Houston took command of the army at San Jacinto. He was chief justice of Texas and in 1845 president of the convention which concluded annexation with the United States. He sat in the United States Senate in 1846-56.

**Ruskin, John,** English critic and author: b. London 8 Feb. 1819; d. Coniston, Lancashire, 20 Jan. 1900. He attended lectures at King's College, London, was trained in drawing, and in 1836 went to Oxford, where he became a gentleman-commoner at Christ Church. In 1839, after two failures, he won the Newdigate prize for a poem on 'Salsette and Elephanta.' His first published works were essays in London's 'Magazine of Natural History' on geological and allied subjects (1834 and 1836), and in 1837-8 he wrote for London's 'Architectural Magazine' on 'The Poetry of Architecture' (separately published, 1893). An attack upon some of Turner's pictures in 'Blackwood's Magazine' in 1836 led him to formulate the plan of his 'Modern Painters,' the 1st volume of which appeared in 1843 as by 'A Graduate of Oxford.' The 2d volume was published in 1846, the 3d and 4th in 1856, and the 5th in 1860 (complete edition, imperial 8vo, with all the original and three new plates, six vols., 1888; 8vo edition, with reduced plates, six vols., 1897). At first intended as a defense of Turner, the work from the first assumed a wider scope, and soon became a comprehensive treatise on the principles of art. He sought to show the immense superiority of the best modern landscape-painters, especially Turner, to all the ancients, and supported the spiritual against the sensuous theory of art with an eloquence and a width of knowledge which have indeed wrought, as Sydney Smith predicted, "a complete revolution in the world of taste." The descriptions of natural scenery in the book are justly regarded as priceless gems of word-painting, and the sense of the indissoluble association of art with all other branches of human activity, so characteristic of Ruskin, became increasingly marked as the work progressed. His name was not put on the title-page till 1851.

After the publication of the 1st volume of 'Modern Painters' he continued his studies and his travels, and during a visit to Venice he definitely decided upon literature as his main work. In 1848 he married Euphemia Chalmers Gray, the 19-year-old daughter of a Scottish lawyer, for whom he had written in 1841 his fairy tale, 'The King of the Golden River' (published 1851). His married life was not very fortunate, and in 1854 the marriage was annulled, and the lady married the artist Millais in 1855. 'The Seven Lamps of Architecture' (1849) sought to do for architecture what Ruskin had already done for painting. The title and arrangement of the book are characteristic of his whole artistic criticism. All work in architecture, and in all else, should be illumined by the lamps of sacrifice, truth, power, beauty, life, memory, and obedience. In 1851 he defended Millais and Holman Hunt, two of the pre-Raphaelite leaders, in letters to the *Times*, and in the same year followed up this advocacy by a work on Pre-Raphaelitism, 'The Stones of Venice' (1851-3), the fruit of much close study and arduous toil, is a worthy companion of 'Modern Painters,' and in it, as in the earlier work, we meet the moralist as artist. The chapter 'On the Nature of Gothic Architecture,' in which his economic teaching is distinctly foreshadowed, was reprinted by

William Morris at the Kelmscott Press in 1891. In 1854 Ruskin came to know D. G. Rossetti, to whom he was a considerate and generous patron; and he was closely associated with F. D. Maurice, Furnivall, and other Christian Socialists in the work of the Working Men's College, where he taught drawing regularly for some seven years. His career as a social reformer may be dated from 1857, when he published a series of lectures on 'The Political Economy of Art' (enlarged edition, entitled 'A Joy for Ever and its Price in the Market,' 1880). His chief works of this kind are: 'Unto this Last' (1866; popular edition, 1900), originally written for the 'Cornhill Magazine'; 'Munera Pulveris' (1872), partly reprinted from 'Fraser's Magazine'; 'Time and Tide by Wear and Tyne' (1867); and 'Fors Clavigera' (1871-84), consisting of letters to the working men and laborers of Great Britain. In these the tendency to exaggeration is clearly manifest, and for a time it stood in the way of the serious consideration of his views. He laid especial stress upon the economic value of healthy, happy, honorable, self-sacrificing life; he directed attention to the vital importance of the problem of distribution and the necessity of economic co-operation; the need for a genuine national system of education, old-age pensions, and a radical solution of the housing problem was eloquently set forth by him. In this work Ruskin always professed himself a follower of Carlyle, one of his warmest friends and admirers. Some of his books published after 1855 were collections of lectures. Such are: 'The Two Paths' (1859); 'Sesame and Lilies' (1865); 'The Crown of Wild Olive' (1866); 'Work, Traffic, War, and The Future of England' (last not in first edition); and 'The Ethics of the Dust' (1866). In 1867 he delivered the Rede lecture at Cambridge on 'The Relation of National Ethics to National Art,' and was awarded the honorary degree of LL.D. by that university, and in 1893 Oxford conferred upon him its D.C.L. degree. In 1871 he was elected lord rector of St. Andrews University.

The period from 1870 till his retirement from active work was full of new schemes of social usefulness, some of them more generous in conception than practicable in execution, but all bearing eloquent testimony to the absolute sincerity of his preaching of the gospel of social righteousness and service. In 1871 he founded the Guild of Saint George, and himself paid \$35,000, a tenth of his possessions at that time, into a trust for carrying on its work. The basic principles of the guild were 'that food can only be got out of the ground and happiness out of honesty,' and in connection with it he started agricultural settlements, some industrial enterprises, and the Saint George's (now Ruskin) Museum at Sheffield.

In 1871 he gave up his house at Denmark Hill and purchased his well-known residence at Brantwood, on the shore of Coniston Lake. In 1870 he was appointed first Slade professor of fine arts at Oxford, and held this post till 1879, when he resigned owing to illness, and again from 1883 till 1884, when he again resigned because the university endowed vivisection. His lectures at Oxford give the best connected

account of his maturer conceptions of art and form the material of the works: 'Lectures on Art' (1870); 'Aratra Pentelici: Six Lectures on the Elements of Sculpture' (1872); 'The Eagle's Nest: Ten Lectures on the Relation of Natural Science to Art' (1872); 'Ariadne Florentina: Six Lectures on Wood and Metal Engraving' (1873-6); 'Val d'Arao: Ten Lectures on the Tuscan Art Directly Antecedent to the Florentine Year of Victories' (1874); 'The Art of England' (1884); 'The Pleasures of England' (1884); and 'Lectures on Landscape Delivered in Lent Term,' 1871 (1897). He founded a drawing school at Oxford, and it was during his professorial period that he tried the famous and exceedingly characteristic road-digging experiment. In 1878 he experienced the first of several attacks of brain fever, and from this time his excessive work at an unnaturally high pressure caused his health to break down seriously; 1878 was also the year of Whistler's libel action against him, in which the jury awarded one farthing damages. The most notable work of his period of final retirement, broken only by short journeys in search of health, is 'Præterita: Outlines of Scenes and Thoughts Perhaps Worthy of Memory in my Past Life' (1885-9), the last volume containing 'Dilecta,' or selections from his correspondence. This fragment of autobiography bears little trace of mental decay, but is notable for brilliant description, vivid recollection, and excellent portraiture of men whom he had known. Of works not above mentioned the following are the most noteworthy: 'Poems' (1850, privately printed; two vols., 1891); 'Examples of the Architecture of Venice' (1851); 'Lectures on Architecture and Painting' (1853); 'Notes on Some of the Principal Pictures Exhibited at the Royal Academy' (1855-9 and 1875); 'The Harbors of England' (1856), with engravings from drawings by Turner; 'Catalogue of the Drawings and Sketches of Turner at present Exhibited in the National Gallery' (1861); 'The Elements of Drawing' (1857), lectures delivered at the Working Men's College; 'Inaugural Address at the Cambridge School of Art' (1858); 'The Oxford Museum' (1859), with H. W. Acland; 'The Elements of Perspective' (1859), lectures delivered at the Working Men's College; 'The Queen of the Air' (1869), lectures on the Greek myths of cloud and storm; 'Mornings in Florence' (1875-7; collected, 1889); 'Proserpina: Studies of Wayside Flowers' (1875-86); 'Deucalion: Collected Studies of the Lapse of Waves and Life of Stones' (1875-83); 'St. Mark's Rest: the History of Venice' (1877-84; collected, 1884); 'The Laws of Fésole: A Familiar Treatise on the Elementary Principles and Practice of Drawing and Painting' (1877-8); 'Notes on the Drawings by Turner Exhibited at the Fine Art Society's Galleries' (1878; new edition, 1900); 'Arrows of the Chase' (1880), a collection of newspaper letters; 'The Bible of Amiens' (1880-5); 'On the Old Road' (1885), a collection of miscellaneous writings. In 1871 a collective edition of his works was begun, but extended to only 11 volumes. E. T. Cook is supervising a new complete edition of his works begun in 1903 and to be finished in 30 volumes.

## RUSKIN UNIVERSITY—RUSS

There is a complete bibliography by T. J. Wise and J. P. Smart (1893). Ruskin prepared the plates, or at least the drawings, for many of his own works, and also painted some landscapes, chiefly in water color. A loan exhibition of his drawings was held in the Royal Water Color Society's rooms in 1901.

To what has already been said of the work and message of Ruskin little need be added. He was essentially a prophet, on fire with the enthusiasm of humanity, almost fierce in his opposition to every kind of insincerity and injustice. His early religious views were narrow, but in middle life he advanced to a broadly liberal position of no distinctively Christian character, though in later years he added to his religious liberalism a more definitely Christian element. What he said of 'Modern Painters' may be applied to all his work: "It declares the perfectness and eternal beauty of the work of God; and tests all work of man by concurrence with, or subjection to that." His teaching has been spread by many Ruskin societies, a Ruskin Hall for working men has been established at Oxford, and at Ruskin, Tenn., a co-operative colony was unsuccessfully attempted. Consult: Collingwood, 'Life and Work of John Ruskin' (1893); and 'Life of John Ruskin' (1900); Ritchie, 'Records of Tennyson, Ruskin, and Browning' (1892); Spielmann, 'John Ruskin' (1900); Harrison, 'Tennyson, Ruskin, Mill, and Others' (1899); Rossetti, 'Ruskin, Rossetti, and Pre-Raphaelitism' (1899); Cook, 'Studies in Ruskin' (2d ed. 1891); Hobson, 'John Ruskin, Social Reformer' (1898); Mallock, 'New Republic' (1881—Herbert stands for Ruskin); Sizeranne, 'Ruskin et la Religion de la Beauté' (1897; Eng. trans., 1899); Smart, 'A Disciple of Plato' (1883); Waldstein, 'The Work of John Ruskin' (1894); Mather, 'Life and Teaching of John Ruskin' (5th ed., 1898); Harrison, 'John Ruskin' (1902); 'English Men of Letters,' new series; Mackail's essay in Chambers' 'Cyclopedia of English Literature' (Vol. III., 1904); Kitchin, 'Ruskin at Oxford and Other Essays' (1904).

Ruskin University, located at Glen Ellyn, Ill., a suburb of Chicago. The ideal of the institution is to unite industrial and educational work, to bring within the reach of young men and women the advantages of college education with the means of paying their own expenses chiefly from their own labor, and to teach the dignity of labor, "not as a means of livelihood only, but as the glad expression of normal life, and an absolute necessity to the acquirement of mental culture and moral character." The university had its origin in Ruskin College, established at Trenton, Mo., in 1900; it conducted there for student self-support a 2,000 acre farm, and a dairy, carried on gardening, laundering, printing, carpentering, etc., and with the co-operation of the citizens of the town established wood-working and canning factories. The larger part of the industrial equipment was not owned by the college; the college buildings also became inadequate for the increasing attendance and a new location became necessary. In January 1903 an affiliation was formed with a number of schools and colleges in Chicago under the corporate name

of Ruskin University, Ruskin College becoming the literary department of the institution; in April of that year the college was moved to Glen Ellyn. The organization of the university includes the Ruskin Industrial Guild, where employment is given in a number of occupations, printing, book-binding, cooking, laundering, horticultural and agricultural pursuits, etc. As far as possible students are given the work for which they have the most liking and aptitude. Those of the student body who become members of the Ruskin Industrial Guild are supplied with four hours of work per day on school days with an extra hour or two on Saturdays, for which they receive Ruskin script, at from 10 to 12½ cents per hour. This script they deposit in the Ruskin Industrial Bank and pay every week, their board bill and other incidental expenses, ranging from two dollars and fifty cents to three dollars per week by check upon the bank. They are required to report for duty in the industrial department just the same as for a Latin or Greek recitation, are marked by the foremen of departments as to the faithfulness in the discharge of duty and are advanced from one department to another upon the strictest sort of civil service rules. The courses offered by the University include: (1) the college preparatory course; (2) the college course, leading to the degree of bachelor of arts; (3) the normal course, leading to the degree of bachelor of pedagogy; (4) the social science course; the completion of which with work in other courses equal to the requirements of the college course, entitles the student to the degree of bachelor of social science; (5) special courses in bookkeeping and stenography, music, art, oratory, dressmaking, telegraphy, and domestic science; (6) the business course, leading to the degree of bachelor of accounts; (7) professional courses in law, medicine, dentistry, pharmacy, or the art craft, at the affiliated schools in Chicago; (8) correspondence courses. The college course is entirely elective and may be completed in three years; the completion of the special courses counts for a certain amount of credit toward the degree. The students in the college department at Glen Ellyn number about 300, and the members of the faculty 15.

Rusling, James Fowler, American soldier: b. Washington, N. J., 14 April 1834. He was graduated from Dickinson College in 1854 and was professor there until 1857, when he engaged in law practice. At the outbreak of the Civil War he entered the Union army with rank as lieutenant. He served in the Army of the Potomac in 1861-3, in the Department of the Cumberland in 1863-5, and in the war department in 1865-7. He attained rank as colonel of volunteers in 1865, was brevetted brigadier-general in 1866 and mustered out of service in 1867. He was United States pension agent for New Jersey in 1868-77 and has published: 'Across America, or the Great West and Pacific Coast' (1874); 'History of Pennington Seminary' (1890); 'Men and Things I Saw in Civil War Days' (1899); 'European Days and Ways' (1902); etc.

Russ, John Denton, American physician and philanthropist: b. Chebacco (Essex), Mass.

## RUSSELL

**1 Sept. 1801; d. Pompton, N. J., 1 March 1861.** He was graduated from Yale in 1823, studied medicine in the United States, in London, and on the Continent, in 1826 began practice in New York, in 1827-30 was in Greece aiding the patriots, and upon his return began the first instruction of the blind attempted in the United States. He was invited to organize the Institution for the Blind in Boston, but preferred to continue his independent work. In 1832 he became superintendent of the New York institution, a post which he resigned in 1838. His inventions and improvements for the assistance of the blind were widely used. Latterly he was active in endeavors to improve prison discipline and further the welfare of discharged prisoners.

**Russell, rŭ's'el, Addison Peale,** American author: b. Wilmington, Ohio, 8 Sept. 1826. He rose from a printer's apprentice to be an editor and publisher, was elected to the Ohio legislature in 1855 and in 1857-61 was secretary of state for Ohio. He has published: 'Half Tints' (1867); 'Thomas Corwin' (1882); 'Characteristics' (1883); 'In a Club Corner' (1890); 'A Club of One' (1887); 'Sub-Colum' (1893); 'Library Notes' (1875-9).

**Russell, Benjamin,** American journalist: b. Boston, Mass., 13 Sept. 1761; d. there 4 Jan. 1845. He was apprenticed to Isaiah Thomas, publisher of the Worcester, Mass., 'Spy,' but entered the Revolutionary army before completing his apprenticeship, and there collected war news for that paper. In 1784 he established the 'Columbian Sentinel,' which he made the most powerful organ of the Federal party in New England, and which he edited until 1808. He also established and conducted in 1795-1830 the 'Gazette,' likewise a Federalist organ. He printed the laws and state documents during the first sessions of Congress and refused to receive pay for his work until it was pressed upon him by Washington; represented Boston in the general court for 24 years; served several terms in the Massachusetts senate; was a member of the executive council, and of the Constitutional convention in 1820.

**Russell, Sir Charles Arthur, Baron of Killowen,** English jurist: b. Newry, Ireland, 10 Nov. 1832; d. London 10 Aug. 1900. He began his career as solicitor in 1854, later matriculated at Trinity College, Dublin, but did not graduate; and in 1856 removed to London, entered Lincoln's Inn and was admitted to the English bar in 1859. In 1872 he was made Queen's counsel, and entered Parliament for Dundalk in 1880, but his part in debate was largely confined to questions concerning Ireland. In 1885 he was returned for South Hackney and became attorney-general in Gladstone's cabinet in 1886. His speeches in behalf of home rule were his most notable parliamentary achievements. He was leading counsel for Parnell in the investigations brought about by the Parnell Commission Act of 1888, and his six days' speech concluding the trial on 12 April 1889 is accounted his greatest forensic effort. He defended the prisoner in the Maybrick murder trial; in 1893 represented Great Britain in the Bering Sea arbitration; in 1894 was made lord of appeal; was raised to a life-peerage as baron

of Killowen, and later succeeded Lord Coleridge as lord chief justice. In 1896 he delivered an address before the American Bar Association at Saratoga, on 'Arbitration: its Origin, History and Progress.' In 1899 he succeeded Lord Herschell as one of the arbitrators to determine the boundaries between British Guiana and Venezuela. His publications aside from his address on arbitration were mainly contributions to current discussions.

**Russell, David Allen,** American soldier: b. Salem, N. Y., 10 Dec. 1820; d. near Winchester, Va., 19 Sept. 1864. He was graduated from West Point in 1845, served in the Mexican War and in 1847 was brevetted 1st lieutenant for gallant conduct. He subsequently served on the Pacific coast, was brevetted captain in 1854, and at the outbreak of the Civil War was assigned to aid in the defense of Washington. In 1862 he was appointed colonel and served in the Peninsular campaign under McClellan. He commanded a brigade in the Rappahannock campaign, was brevetted colonel in the regular army, assisted in the capture of the Rappahannock station and commanded a division at the battles of the Wilderness, Spotsylvania, and North Anna. He was engaged in the defense of Washington in August and September 1864, and was killed while leading his column at Opequan, Va., 19 Sept. 1864. He was brevetted major-general of regular army the same day.

**Russell, Henry Benajah,** American journalist: b. Russell, Mass., 9 March 1859. He was graduated from Amherst in 1881, was attached to the New York Sun 1884-8, was on the editorial staff of the Providence Journal 1889-90, and of the Hartford Post 1890-7. He has published 'Life of William McKinley' (1896); 'International Monetary Conferences' (1898); 'Our War with Spain' (1899).

**Russell, Israel Cook,** American geologist: b. near Gervattsville, N. Y., 10 Dec. 1859; d. Ann Arbor, Mich., 1 May 1906. He was educated at the College of the City of New York and Columbia School of Mines, and accompanied the United States expedition to New Zealand to observe the transit of Venus. In 1879 he became assistant professor of geology at Columbia and from 1880 was attached to the United States geological survey, for which he made surveys in the Rocky Mountains, Southern Appalachian regions, and in Alaska. In 1899 he ascended the Yukon and made his way to Lynn Canal, and in 1890-1 led expeditions to Mount Saint Elias. In 1892 he became professor of geology at the University of Michigan. His contributions to geography and geology embrace 'Geological Reconnaissance in Central Oregon' (1883); 'Geological History of Lake Lahontan' (1885); 'Quaternary History of Mono Valley, California' (1887); 'Existing Glaciers of the United States' (1889); 'Sub-aerial Decay of Rocks' (1889); 'A Second Expedition to Mount Saint Elias' (1892); 'A Geological Reconnaissance in Central Washington' (1893); 'Lakes of North America' (1895); 'Present and Extinct Lakes of Nevada' (1895); 'Glaciers of North America' (1897); 'Volcanoes of North America' (1897); 'Rivers of North America' (1898).

**Russell, James Earl,** American educator: b. Hamden, N. Y., 1 July 1854. He was graduated from Cornell in 1887, studied at the

universities of Jena, Leipzig, and Berlin, and in 1895-7 occupied the chair of philosophy and pedagogy at the University of Colorado. He was appointed professor of education at the Teachers' College, Columbia University, in 1897, and since 1898 has been dean of that college. He has published: 'The Extension of University Teaching in England and America' (1895); 'The History, Organization, and Methods of Secondary Education in Germany' (1899); etc.

**Russell, John, 1st Earl Russell**, English statesman, 3d son of John, 6th Duke of Bedford: b. London 18 Aug. 1792; d. Richmond Park, Surrey, 28 May 1878. He was educated at Edinburgh University, where he trained himself to debate at the meetings of the Speculative Society. In July 1813 he entered Parliament and soon gained prominence among the politicians of the day. He early took up the subject of parliamentary reform, and supported the repeal of the Test and Corporation Acts, and Roman Catholic emancipation. In 1828 he had the satisfaction of seeing the Test and Corporation Acts repealed by the Wellington ministry, and in April 1829 the Catholic Relief Bill became law. When the Grey cabinet was formed in 1830 Lord John Russell, then paymaster-general of the forces, was elected one of a committee of five to formulate a Reform Bill. This was brought before the House of Commons 1 March 1831 by him, and though he defended it clause by clause with extraordinary vigor, it was ultimately rejected. Upon this the Whig ministry resigned, and an appeal made to the country. The elections resulted in a majority favorable to the bill, which received the royal sanction 7 June 1832. In Lord Melbourne's second cabinet (1835-41) he was at first home secretary and then colonial secretary, and on the outbreak of the Canadian rebellion, by recognizing the right of the colonists to self-government, reconciled them to the mother country. From 1841 (in which year he became member for the city of London) to 1845, during the Peel administration, Lord John Russell led the opposition, but lent his influence in favor of the repeal of the corn-laws. He was premier 1846-52, and was able to pass his Ecclesiastical Titles Bill of 1851, prohibiting the assumption of the territorial titles by Roman Catholic bishops. Lord Derby who followed him soon resigned and under the succeeding administration of Lord Aberdeen, Russell was foreign secretary for a short time. He also filled the post of lord-president of the council from June 1854 to February 1855. He was colonial secretary under Lord Palmerston in 1855, and represented Great Britain at the Vienna conferences; but his conduct of the negotiations brought him so much unpopularity that he resigned in July of that year. When Palmerston returned to power in 1859 Lord John again became foreign secretary, with a seat in the cabinet. He took a leading part in regard to such political questions as the oppression of the Poles by Russia, the aggressive policy of German powers toward Denmark, and the disputes between England and the United States as to the neutrality observed during the continuance of the Civil War. He retained his seat for the city of London from June 1861 till July 1861, when he was raised to the peerage as Earl Russell. After the death of Lord Palm-

erston 18 Oct. 1865 Earl Russell became prime minister for the second time, Gladstone taking the lead in the House of Commons. During the session of 1866, in conjunction with Gladstone, he introduced a new Reform Bill, which failing to pass the ministry, resigned, and was succeeded by that of Lord Derby. Thenceforth Earl Russell held no office in any ministry, though he always took an active part in promoting Liberal measures.

He published among other works: 'History of the British Constitution' (1821); 'Essay on the History of the English Government' (1823); 'Memoirs of the Affairs of Europe' (1824-9); 'Essay on the Causes of the French Revolution' (1832); 'Memoirs and Correspondence of Thomas Moore' (1832-6); 'The Life and Times of Charles Fox' (1859-66); 'Selections from Speeches of Earl Russell, 1859 to 1865'; 'Recollections and Suggestions, 1813-73' (1875). Consult: Walpole, 'Life of Lord John Russell' (1889); Reid, 'Lord John Russell' (1895).

**Russell, John Edwards**, American politician: b. Greenfield, Mass., 30 Jan. 1834; d. Leicester, Mass., 27 Oct. 1903. He was engaged in business in South America in 1857-63, and after his return to New York was interested with Benjamin Holliday in the Overland Mail enterprise. He was secretary of the Massachusetts State Board of Agriculture in 1880-7 and in the latter year was elected to Congress, but declined a renomination. He continued active in politics, but held no further public office.

**Russell, John Scott**, Scottish engineer and naval architect: b. Glasgow 8 May 1808; d. Ventnor, Isle of Wight, 8 June 1882. He was educated at the universities of Edinburgh, Saint Andrews, and Glasgow, graduating from the latter at 16. In 1832 he was professor of natural philosophy in Edinburgh University. During his researches into the nature of waves he discovered the existence of the wave of translation, on which he founded the wave-line system of construction of ships introduced into practice in 1835. In 1844 he removed to London, and was for many years a well-known shipbuilder on the Thames. He became joint-secretary of the Royal Commissioners for carrying out the Great Exhibition of 1851, and took a leading part in organizing it. He built the Great Eastern; was joint-designer of the first English sea-going armored frigate, the Warrior, and constructed the vast dome of the Vienna Exhibition of 1873. He published: 'The Modern System of Naval Architecture for Commerce and War' (1864-5); 'Systematic Technical Training for the English People' (1869); and 'The Wave of Translation in the Ocean of Water, Air, and Ether' (new ed. 1885).

**Russell, Lillian** (HELEN LOUISE LEONARD), American comic opera singer: b. Clinton, Iowa, December 1861. She sang in 'Pinafore' under E. E. Rice in 1879, and later appeared in New York at Tony Pastor's theatre. She soon became the star in the McCaull Opera Company and played leading parts in 'Snake Charmer,' 'Olivette,' 'Patience,' and 'The Sorcerer.' She sang in London in 1883 and returned to New York in 1885, from which date until 1892 she sang at the Casino in various roles. She retired

her hold as a popular favorite and in recent years has sung at Weber & Fields' music hall.

**Russell, Sol Smith**, American actor: b. Brunswick, Maine, 15 June 1848; d. Washington, D. C., 28 April 1902. He first appeared on the stage at Cairo, Ill., singing and playing small roles. Later he joined the Peake Family of Beltingers, and in 1866 played in Ben de Bar's stock company in Saint Louis. In 1871 he made his first New York appearance, and three years later joined Augustin Daly's company. In 1880 he appeared as a star in 'Edgewood Folks,' and adopted a style of acting that gained him wide popularity. To this natural and quiet style he adhered in his subsequent plays, such as 'A Poor Relation'; 'The Tale of a Coat'; 'Penceful Valley'; 'A Bachelor's Romance.' His last play was the 'Hon. John Grigsby,' produced in 1899.

**Russell, William**, Lord, English statesman: b. 29 Sept. 1639; d. London 21 July 1683. He was educated at Cambridge, was elected to Parliament for Tavistock in 1661, and became one of the leaders of "the country party" in 1673, coming forward in opposition to the attempts of the king and his partisans to destroy English freedom through the aid of France. In 1678 he became Lord Russell, and heir apparent to the earldom of Bedford. On 14 March 1678 he seconded the motion to declare war against France, and spoke in support of it. In November 1678 he was chosen to move in the House of Commons that the Duke of York should be removed from the king's presence and council. When the new council proposed by Sir William Temple was formed, Lord Russell was appointed one of the 30 members. He was not at first in favor of excluding the Duke of York from the succession, but finally supported the measure. He left the council at the beginning of 1680. On 26 October he spoke in favor of measures against "popery, and to prevent a popish successor" to the crown; and a week later seconded Colonel Titus' motion to disabie the Duke of York from becoming King of England. When the reaction against the Whigs took place, the government of Charles II. resolved to destroy their leaders, proceeding to do so according to the forms of law. He was arrested on the charge of having been concerned in the Rye House plot, said to have been formed by Rumbold and others, for an attack on the king and the Duke of York, and after his examination was committed to the Tower. His trial took place at the Old Bailey 13 July 1683. The charge against him was "for conspiring the death of the king, and consulting and agreeing to stir up insurrection; and to that end to seize the guards (appointed) for the preservation of the king's person." No counsel was then allowed to the accused, except on points of law; his condemnation quickly followed and he was beheaded in Lincoln's Inn Fields. Consult 'Life of Lord Russell' by Lord John Russell (1819).

**Russell, William Clark**, English novelist: b. New York 24 Feb. 1844. Educated at Winchester and Boulogne, he was a midshipman in the merchant service 1857-65. His first story, 'John Holdsworth, Chief Mate,' appeared in 1874 and was very successful; but he won still greater success with 'The Wreck of the

Grosvenor' in the following year. Among his numerous novels are: 'An Ocean Freeland' (1878); 'My Shipmate, Louise' (1882); 'A Sea Queen' (1883); 'An Ocean Tragedy' (1884); 'Alone on a Wide, Wide Sea' (1892); 'The Emigrant Ship' (1894); 'The Convict Ship' (1895); 'What Cheer!' (1895); 'List, Ye Landsmen!' (1897); 'The Two Captains' (1897); 'Romance of a Midshipman' (1898); 'A Voyage at Anchor' (1899); 'The Pretty Polly' (1900); 'The Ship's Adventure' (1899); 'His Island Princess' (1905); several collections of short stories, and lives of Nelson (1890) and Collingwood (1891). He was for some time connected with the Newcastle *Daily Chronicle*, but for several years, ending in 1887, was on the staff of the London *Daily Telegraph*.

**Russell, William Eustis**, American lawyer and political leader: b. Cambridge, Mass., 6 Jan. 1857; d. Little Palos, Quebec, Can., 16 July 1896. He was graduated from Harvard in 1877, and from the Boston University Law School in 1879, winning the Lawrence prize for the best legal essay. He was admitted to the Massachusetts bar in 1880 and began the practice of law with his father's firm. He also became an active member of the Democratic party; was elected to the common council of Cambridge in 1881, to the board of aldermen in 1883 and 1884, and was mayor of the city 1885-7. His efficient administration as mayor, and his effective campaign speeches during the Presidential campaign of 1884, had made him a prominent figure in State politics, and in 1888 he was the Democratic nominee for governor. He was defeated in that year and again in 1889, but in 1890 was elected and twice re-elected in 1891 and 1892. He took an active part in all his gubernatorial campaigns, making numerous speeches in all parts of the State. His election as governor for three successive years was an unusual testimony to his personal integrity and popularity, as the majority of the legislature and the State officials were Republicans. Several laws were passed on his recommendation, including a measure to regulate the lobby, and a law abolishing the property qualification for governor, and the poll tax. At the close of his term he resumed the practice of law, and in 1894 was appointed a member of the board of Indian commissioners. In 1896 he was one of the most active opponents of the adoption of the free silver platform at the Democratic National Convention, and distinguished himself by a remarkable speech pleading for a return to the original principles of the Democracy; he was prominently mentioned as a candidate for the presidency by those who favored the gold standard. His death occurred suddenly, shortly after the convention, and was thought to be due largely to the strain he had undergone at that time.

**Russell, Sir William Howard**, English journalist: b. near Dublin, Ireland, 28 March 1820; d. London, Eng., 10 Feb. 1907. He was educated at Trinity College, Dublin, and was called to the bar in 1852. His journalistic career began in 1843 on the staff of the London *Times*. He was its special correspondent during the Danish war of 1848-50, during the Crimean war, in 1854-6, reported the Indian mutiny in 1857-8, the Italian campaign 1859, the Civil War in the United States in 1861-2,

## RUSSELL—RUSSELLVILLE

the Danish war of 1864, the Prusso-Austrian war 1866, and the Franco-German war of 1870. He accompanied the Prince of Wales to Egypt in 1888 and was his honorary private secretary on his visit to India in 1875. In 1879-80 he was again engaged as war correspondent in South Africa, and in 1883-4 was on that duty in Egypt. He was knighted in 1895 and was editor of the 'Army and Navy Gazette.' His publications include: 'British Expedition to Crimea'; 'Diary in India'; 'My Diary—North and South' (1863); 'The Prince of Wales Tour' (1877); 'Hesperothen' (1882); 'The Great War with Russia' (1895); 'Tolben's Sebastopol'; etc.

**Russell, House of**, English noble family presumed to have descended from Turstain, a Scandinavian jarl who settled in Normandy after its conquest by the Northmen, and became possessed of the Castle of Rozel, near Caen. The name of HUGO DE ROZEL appears in a charter of Matilda, the wife of William the Conqueror, dated 1066; and also with that of his elder brother, on the roll of Battle Abbey. Both accompanied Robert of Normandy in the first crusade. The elder died there, but Hugh returned and settled in England. A descendant of his, JOHN ROZEL or RUSSELL, as the name had now begun to be written, was constable of Corfe Castle about 1221; and another WILLIAM RUSSELL represented Southampton in the first Parliament of Edward II. SIR JOHN RUSSELL, a direct descendant of the last named, was speaker of the House of Commons in Henry VI.'s reign. His grandson, SIR JOHN, was in favor with Henry VIII. The lands of the Abbey at Tavistock, and of the dissolved monastery at Woburn, were conferred on him, and he was made 1st Earl of Bedford. His son, the 2d earl, died without issue, and the title passed into another branch of the Russell family. WILLIAM RUSSELL, 5th earl, was created Marquis of Tavistock and Duke of Bedford in 1694. A notable member of the family was ADMIRAL EDWARD RUSSELL, who distinguished himself by his victory over the French fleet at La Hogue in 1692. JOHN, 4th duke (b. 1710; d. 1771), held office in the Newcastle and Grenville ministries, and was lord-lieutenant of Ireland in 1756-62. FRANCIS, 5th duke (1765-1802), was distinguished for his services to agriculture. FRANCIS, 7th duke (b. 1788; d. 1861), was summoned to the House of Lords in 1832, before the death of his father. He held no political office, but like most members of the family gave staunch support to the Whigs. The 9th duke, FRANCIS, was succeeded by his son GEORGE, the 10th duke, in 1891, and he by his brother HERBRAND in 1893.

**Russell's Viper**, one of the largest and most venomous serpents (*Daboia russelli*) of the East Indian region; justly dreaded throughout southern and eastern India, Ceylon, Burma, and Siam. It may reach a length of five feet, and is yellowish-brown with three longitudinal series of black, light-edged rings, which sometimes encircle reddish spots. It is known also as chain-viper, tic-palanga (Ceylon), etc., and is regarded by experts as the most deadly in India, but fortunately it is neither as numerous nor as easily provoked as the cobra. According to Fayer it is nocturnal in its habits, sluggish

and does not readily strike unless irritated, when it bites with great fury; moreover its loud hissing when disturbed is likely to give one sufficient warning to enable him to jump out of reach of its fangs. It is said to kill many grazing cattle. The action of its poison resembles that of the rattlesnake, but gives rise to hemorrhagic extravasations from the kidneys and various other organs. Consult: Fayer, 'Thanatophidia of India' (1874); Gadow, 'Amphibia and Reptiles' (1901).

**Russellville, Ark.**, town, county-seat of Pope County; on the St. Louis, I. M. & S. and the Dardanelle & R. R.R.s; about 80 miles northwest of Little Rock. It is in an agricultural region in which the chief product is cotton. The lumber interests are quite important. The chief manufactures are cotton and lumber products, flour, dairy products, and agricultural implements. The two banks, one national and one state, have a combined capital of \$80,000. Pop. (1910) 2,036.

**Russellville, Ky.**, city, county-seat of Logan County; on the Louisville & Nashville railroad; about 25 miles west-southwest of Bowling Green and 52 miles north by west of Nashville. It is in an agricultural region in which tobacco is one of the chief products. The chief manufacturing establishments are flour mills, tobacco factories, wagon and carriage works, and furniture factories. It contains the Logan Female College (M. E. S.), established in 1867, the Bethel College (Baptist), founded in 1854, public schools and a public library. The three state banks have a combined capital of \$175,000. Pop. (1910) 2,690.

**Russellville, Engagements at.** After the defeat of Gen. W. E. Jones at Morristown, Tenn. (q.v.), 10 Dec. 1863 he was followed by a Union force under Col. Graham, and when near Russellville Graham ran into Gen. Morgan's cavalry division, which was foraging. He was attacked and driven back, leaving some dead, wounded, and prisoners in the hands of the Confederates. Late in October 1864 Col. J. B. Palmer, 58th North Carolina, with about 800 men and 3 guns, moved from North Carolina into East Tennessee to co-operate with the Confederate troops under Gen. Vaughn, and 28 October he was ordered by Vaughn to take position in rear of Russellville, on the Bull's Gap road. He had scarcely taken position when Vaughn's brigade, defeated at Morristown, swept past him in great disorder. He formed line, threw out skirmishers, and opened fire with his three guns upon Gillem's pursuing troops, checking them and enabling Vaughn to rally about 200 of his men. Gen. Gillem, who, with a brigade, was at Henderson's Depot on 8 Nov. 1864, hearing that Gen. Breckinridge was advancing to reconquer East Tennessee, fell back to Greeneville on the 9th and to Bull's Gap on the 10th, where he was attacked on the morning of the 11th by Gen. Duke's cavalry brigade, and held his own during the day. The attack was renewed by Breckinridge on the 12th with artillery; he next assaulted in front and in rear with cavalry, both being repulsed. Breckinridge again renewed the attack on the 13th, and kept it up all day. Gillem, being now almost out of ammunition, and without food for his men and forage for his horses, abandoned his position during the night and fell back toward

# RUSSIA

Russellville. He took position on the road, at its intersection with the Knoxville and Greenville road, intending to hold that point until his trains had passed it. Nearly all his trains had passed, and were going through Russellville, when, on the 14th, his rear was attacked by Breckinridge with the brigades of Duke and Vaughn. His men were thrown into disorder, became panic-stricken, could not be rallied, and retreated through Russellville to Strawberry Plains. He had 41 killed and wounded, and lost six guns, 132 wagons and ambulances, and 300 horses. About 200 of his men were captured. Consult 'Official Records,' Vols. XXXI. and XXXIX.

E. A. CARMAN.

Russia, an extensive empire comprising the whole of eastern Europe from about 17° 40' east, and stretching continuously for about 170 degrees over the whole continent of Asia to Bering Strait, or nearly half of the circuit of the world. The boundaries are the Arctic Ocean on the north, Bering Strait and Bering Sea on the east, the Pacific Ocean, Chinese Empire, Afghanistan, Persia, Asiatic Turkey, and the Black Sea on the south, and Rumania, Austria-Hungary, Germany, the Baltic Sea, and Sweden on the west. The length east to west is estimated at about 7,000 miles; the average breadth north to south is about 1,500 miles. The whole area is officially given at 8,660,395 square miles, approximately twice the area of Europe, and one sixth of the land surface of the globe. The empire consists of several well defined parts; in Europe, Poland and Finland (qq.v.), besides European Russia, the latter although less than a fourth of the whole, including nearly three fourths of the entire population; in Asia—northern Caucasia, Transcaucasia, the Steppes, Turkestan, the Caspian and Transcaspian, and Siberia. The appended table gives the official divisions of the empire, their area, population, and the density per square mile of land; the areas occupied by water are included in the total, but the densities of the population are calculated on the land area.

Imperial expansion in Asia has been a marked feature of Russian policy since the 18th century. The first settlements on the Pacific slope were established on the Sea of Okhotsk, and by 1859 the boundaries were pushed so far south as the Amur River. In North America, Russia had extended its sovereignty over the Alaskan Peninsula, which, however, it sold in 1867 to the United States for \$7,200,000. (See ALASKA and ALASKAN BOUNDARY COMMISSION.) In 1872 it compelled Khiva (q.v.) to acknowledge the suzerainty of the Czar, and in the following year Bokhara (q.v.), on which pressure had been brought to bear since 1850, and which had been invaded in 1866, became practically a Russian dependency. In 1875, the island of Sakhalin in the Sea of Okhotsk, north of Japan, was ceded to Russia by the Japanese. In 1898, after Japan's successful war with China, Russia obtained from Japan a lease of the Liao-tung peninsula, with the important ports of Dalny and Port Arthur (q.v.), and after the Boxer uprising of 1901, occupied Manchuria (q.v.). Meanwhile Armenia had been partly absorbed; Russian influence had been strongly established in the Mongolian steppes, and the military outposts in Turkestan had been extended southward in the Pamirs.

The largest cities of European Russia are the capital, Saint Petersburg, 1,267,023; Moscow, 988,614; Warsaw, 638,209; Odessa, 405,041; Lodz, 315,209; Riga, 256,197; Kiev, 247,432; Kharkov, 174,846; Vilna, 154,532; Saratov, 137,109; Kazan, 131,508; Ekaterinoslav, 121,216; Rostov-on-the-Don, 119,889; Astrakhan, 112,880; Tula, 111,048; Kishinev, 108,796; Nijni-Novgorod, 95,124. The cities of Asiatic Russia above 100,000 population are Tiflis, 160,645; Tashkend, 156,414; and Baku, 112,253.

The continuity of the empire might appear to demand a detailed description in a single article; but its immense magnitude, and the distinct names commonly used to designate the different portions, make it more convenient to consider them separately under the heads of European Russia, and Siberia and Asiatic Russia. See article SIBERIA AND ASIATIC RUSSIA.

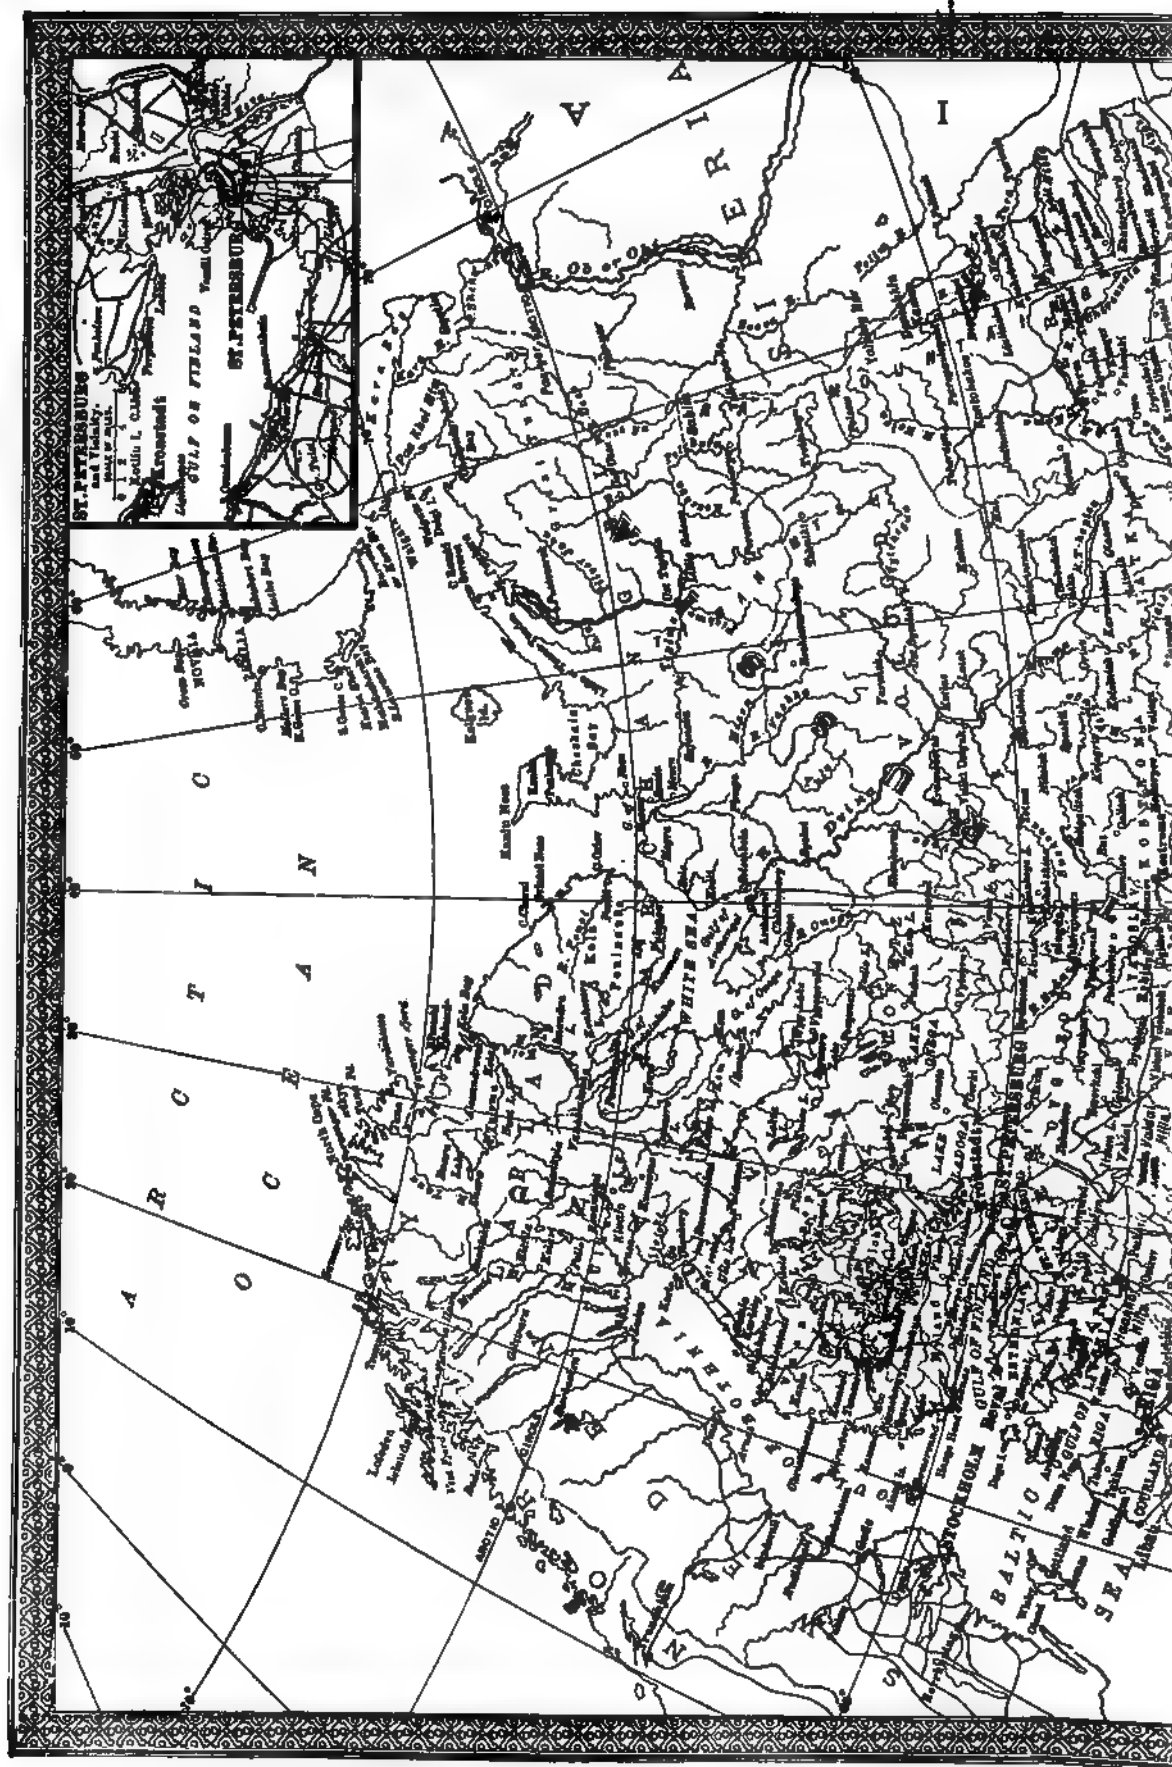

## EUROPEAN RUSSIA.

Various classifications, partly historical and partly geographical, of the numerous divisions of European Russia, besides Poland and Finland, include Great Russia, Little Russia, South Russia, West Russia, the Baltic Provinces, and Caucasus.

The boundaries of European Russia on the north and west are the same as those given above for the empire. Its southern boundaries also are the same as far east as the eastern shores of the Caspian Sea. The eastern boundary is not so well defined. In its northern part the Ural Mountains form such a definite natural barrier that their title to fix the frontiers of Europe and Asia, so far at least as the governments Archangel and Vologda extend, has been almost universally recognized. To the south of this the boundary may be said to be almost arbitrary, but is generally conceded to follow the Ural chain southward till it reaches the sources of the river Ural, and then follow the course of this river to its mouth in the Caspian. Parts of the governments of Perm and Orenburg, however, extend across the Ural Mountains, and are therefore in Asia. European Russia, as thus defined, is bounded northeast by the Ural Mountains, east by the government of Tobolsk, the steppes of the Kirghiz, and the Caspian Sea.

**Topography.**—The surface, in the most general view that can be taken of it, is two immense plains, the boundary between which is marked, though not very definitely, by a broad central ridge which stretches across it in an irregular waving line, mainly in a northeast direction, commencing on the frontiers of Poland, and terminating on the west side of the Ural Mountains, near lat. 62° N. This ridge forms the eastern continuation of the great watershed which divides the whole continent of Europe into a north and a south basin; but, unlike the west part, which is composed of lofty mountain chains or elevated plateaus, is only of moderate height, never exceeding 1,000 feet above sea-level. Even this height is attained only in the Valdai Hills, the far greater part of which, and of the remainder of the ridge, has an average height of not more than 500 feet. The only regions where the surface assumes a mountainous appearance are in the east, where the Ural chain, though nowhere much exceeding 5,000 feet, looks more elevated, at least in its northern part, from its high latitude and consequent covering of perpetual snow; and in the south, where the Mountains of the Yaila chain, lining the southern shores of the Crimea, have a height of about 4,000 feet. With these exceptions the only other parts of European Russia which, according to the limits above assigned to it, do not belong to its two immense plains, are those districts of Perm and Orenburg which are situated on the east side of the Urals, and slope toward the almost boundless steppes of Asia. The const-

# RUSSIA IN EUROPE

SCALE OF MILES

Scale of Miles

Sea of European Russia was confined to the Arctic Ocean until the end of the 17th century, and it was only by conquest that Russia obtained a seaboard on the Baltic and the Black Sea; the latter, however, remains practically an inland sea, the entrance to which is in the hands of Turkey. The Arctic Ocean, affording excellent fishing grounds in the western portion, makes, with the White Sea, a deep indentation on the north coast, but its gulfs, Kandalaksha, Onega, and Dvina, are ice-bound for nine months every year. Archangel, the chief port, is comparatively unimportant. Farther east, Cheskaya and Pechora bays are surrounded by frozen deserts. The Kara Sea, between the crescent-shaped island of Nova Zembla and the coast of Siberia, is navigable for a few weeks only every year. The islands of Kolgueff, Vaygatch, Nova Zembla, and the islands of Siberia are uninhabited. The Baltic Sea, with the Gulfs of Bothnia, Finland, and Riga, is the chief sea of Russia; but it nowhere touches purely Russian territory, its coasts being peopled by Finns, Letts, Esthonians, and Germans. Nevertheless, four out of the five chief ports of Russia—Saint Petersburg, Revel, Libau, and Riga—are situated on the Baltic Sea. Three of them are frozen during four to five months every year; and Libau is the only one which has its roads open nearly all the year round. The chief islands of the Baltic are the Åland archipelago, belonging to Finland; Dagö, Osel, Moen, and Worms at the entrance of the Gulf of Riga; Hochland and Kotlin (with the fortress of Cronstadt) in the Gulf of Finland.

The Black Sea acquires more and more importance every year. The fertile steppes of its littoral are being rapidly settled, and the centre of gravity of Russia's population is gradually shifting south. The Black Sea suffers, however, from a lack of good ports. Its great gulf, the Sea of Azov (ports Taganrog and Rostoff), is very shallow; the fine ports of the Crimea are too remote from the mainland; and the seaboard of Northern Caucasus is separated from the interior by a high chain of mountains. Odessa is the chief port of this sea; and it has no rival in Russia except Saint Petersburg. Nikolaiev is the principal naval arsenal; and Sebastopol remains a naval station. Batum, the chief port of Transcaucasia, is of great importance for the export of petroleum. The Caspian Sea, which receives the chief river of European Russia—the Volga—is a valuable medium of communication between the central Asian dominions of the empire and the Caucasus, as also for trade with Persia (to which the south coast belongs); but it has no outlet to the ocean, nor is there any probability of connecting it advantageously by canal with the Black Sea, its level being 70 feet below sea-level.

**Hydrography.**—The rivers are remarkable for their number and magnitude. The broad central ridge already referred to forms the great water-shed of the country, sending the waters on its north side either to the Arctic Ocean or Baltic Sea, and those on the south side to the Black Sea or the Caspian, thus forming four distinct basins. The Arctic Ocean receives directly the Pechora, which drains chiefly the western slopes of the Ural Mountains by a number of important affluents, accumulates them into one great flood, which then flows almost due north, and empties

itself into a wide estuary remarkable for the number of islands which the alluvial deposits of the river have formed within it. Through the White Sea, the Arctic Ocean receives the waters of the Mezen, Northern Dvina, and Onega. The most important of the three is the Dvina, which, receiving its supplies in nearly equal quantities from the east of the Vithegda, and from the west by the Sochona, proceeds northwest in a circuitous course, continually augmented by large affluents, and falls into the Gulf of Archangel, a little below the well-known port of that name. The surface drained by the rivers of this basin is almost entirely confined to the two extensive governments of Archangel and Vologda. The basin next in order is that of the Baltic. Its principal rivers are the Kemi and Tornea (the latter common to both Russia and Sweden), which fall into the Gulf of Bothnia; the Kymmene, Neva, and Narva or Narowa, which fall into the Gulf of Finland; the Aa and Düna or Western Dvina, which fall into the Gulf of Riga; the Niemen or Memel, which enters Prussia before terminating its course; and the West Bug, an affluent of the Vistula. To the basin of the Black Sea belong the Dniester, South Bug, and Dnieper, which have all their mouths at a short distance from each other in the neighborhood of the rising seaport of Odessa; the Don, which falls into the northeast extremity of the Sea of Azov; and the Kuban, which derives its chief supplies from Circassia. The last basin, that of the Caspian, is in some respects the most remarkable of all, since, though Europe sends it only two large rivers, the Ural and the Volga, both supplied in part from Asiatic sources, the latter not only surpasses all other Russian rivers, but is one of the greatest of Europe. The lakes of Russia are on a scale of magnificence commensurate with that of the rivers. To say nothing of the Caspian, which, being wholly surrounded by land, and even incapable from the lowness of its level, of discharging itself into any other sea, is truly a lake—Russia has others of vast extent. To the basin of the Baltic belong Ladoga, the largest lake in Europe; Onega, Peipus, and Ilmen. Finland, too, which toward its south extremity is a mere network of lakes, sends all its waters to the Baltic. Almost all the other lakes of any size belong to the basin of the Volga; chief of these are the Bielo-Ozero, in the government of Novgorod, and the Koubinskõe, in the government of Vologda. In the south are several large salt lakes, among them the Elton and the Khaki Salt Marsh, in the government of Astrakhan.

**Geology.**—A vast tract of gneiss and other crystalline schists, penetrated by granite, extends west from the Gulf of Bothnia, and north from the Gulf of Finland over the whole principality of the latter name, the western part of the government of Oloneta, and the extensive part of the government of Archangel which is isolated from its main body by the White Sea. The only other region where a similar development occurs is in the south, where a large granitic steppe stretches in a southeast direction. It commences near Ovrutch, in the northeast of the government of Volhynia, covers the far greater part of the government of Kiev, as much of the government of Podolsk as lies north of the Bug, the northern half of the government of Kherson, the west and south of Ekaterinoslav, and a part

of Taurida, and terminates just before reaching the shores of the Sea of Azov, from which it is excluded by a narrow belt of Tertiary marls and limestone. In the east, however, and along the whole crest of the Ural Mountains, from their commencement on the shores of the Arctic Ocean, and almost continuously southward to their last ramifications, granite of more recent origin than that already mentioned occurs, in connection with other eruptive rocks of gneiss, porphyry, syenite, serpentine, etc. These rocks are overlain on both sides of the chain by metamorphic schists, forming long and narrow belts nearly parallel with its principal axis. Immediately to the west appears a similar belt of Silurian strata, which, where lowest in the series, are in the state of chloritic and talcose schists. The only other locality where the Silurian system receives a marked development is on the southern shores of the Gulf of Finland, where it stretches from its western extremity east along the governments of Esthonia and Saint Petersburg, and is then continued across the isthmus between the eastern extremity of the gulf and Lake Ladoga, and along the southern and south-eastern shores of that lake. In immediate contact with this Silurian formation on the south, but on a much more magnificent scale of development, appears the Devonian system, or Old Red Sandstone. The main body of this formation commences near the southeastern shores of the Baltic, and gradually widens out with its north-eastern and southeastern sides, so as to assume the shape of a wedge. It then forms a wide fork, sending one of its branches northeast across Lake Onega, and along Archangel Bay to the northwestern extremity of Mezen Bay, and the other southeast to the northwestern frontiers of Voronezh. It thus covers continuously the whole of the governments of Kurland, Livonia, Vitebsk, and Pskov, and parts of Vilna, Minsk, Mohilef, and Smolensk, on the one side, and of Petersburg and Novgorod on the other; while its northeast branch traverses Olonets, and penetrates into Archangel; and its south-east branch stretches over considerable parts of Kaluga, Orel, and Tula. The only other localities in which the same formation occurs is as a belt stretching south-southeast from the eastern coast of the Gulf of Tchekasia in the Arctic Ocean, and in a longer but narrower belt on the western side of the Ural chain, where it immediately overlies the Silurian formation already mentioned. The formation next in order is the Carboniferous. The main body of it lies within the above fork of the Old Red Sandstone, and in immediate contact with it, and then keeping parallel with the northeast branch of the fork, is continued in the same direction to its termination in Mezen Bay. It occupies the whole of the government of Tver, the capital of which is situated near its centre; and large parts of Smolensk, Kaluga, Tula, and Riazan on the one side, and of Novgorod and Olonets on the other. The government of Moscow is situated in the very heart of it, and that of Vladimir on its eastern side. It is evidently continued beneath these governments, and covers part of their surface, the other and far greater part being covered by oolite or Jura limestone. The Carboniferous system occurs in other two distant and isolated localities; the one in the south, a little north of the Sea of Azov, where

it occupies the eastern part of the government of Ekaterinoslav, and the western extremity of that of Don Cossacks, and where, too, the coal forming the characteristic mineral of the system is partially worked by pits; the other locality is on the western side of the Ural chain, where, in the ascending series, it succeeds the Silurian and Devonian systems, and has a larger development than either of them. This development of the Carboniferous system on the side of the Ural chain, and the still larger development above described as existing in the governments of Smolensk, Kaluga, etc., form the opposite boundaries of a system which in European Russia is highly developed; and to which from the large space which it covers in Perm and the contiguous governments, the name of the Permian system has been given. Its rocks belong to the upper part of the coal measures, and consist chiefly of magnesian limestone and new red sandstone. The latter name is still often applied to the whole system. The Permian system extends over the governments of Kostroma, Viatka, and Kazan, and large parts of Archangel, Vologda, Yaroslavl, Nijni-Novgorod, Simbirsk, Orenburg, and Perm. In the north of the governments of Kostroma and Viatka, and more especially in the part of Vologda between the towns of Nikolai and Ust-Sisolsk, it disappears for a time beneath strata belonging to the Jurassic or oolitic system. This system is developed partially in several other localities, and very largely in the northeast of the government of Archangel. Immediately above it in the geological series is the Cretaceous system, of which the principal localities are Chernigov, Orel, Kurak, Kharkov, and Voronezh, near the centre; Volhynia and a small part of Poland in the west; and a long tract along the northern base of the Caucasus. The rocks next in succession belong to the Tertiary formation, which in both its Eocene and Miocene periods is very largely developed. Strata of the Eocene period, commencing in the east in the government of Simbirsk, stretch west over the greater part of the governments of Pemma and Tambov, then, after a considerable interruption, reappear on the frontiers of Kurak and Kharkov, cover the far greater part of the governments of Chernigov and Poltava, and are thence continued without interruption into the governments of Mohilev, Minsk, Grodno, and finally into Poland. The Miocene period has its chief developments in Volhynia, Podolsk, and Bessarabia. Beds of still more recent formation may be traced in the limestones, marls, and clays on the northwestern shores of the Black Sea, on the far greater part of the Peninsula of the Crimea, on the eastern and northern shores of the Sea of Azov, on the low flats along the western and northern shores of the Caspian, and the low, sandy steppes of Astrakhan. Mere alluvial deposits, of comparatively recent date, are to be found in a greater or less degree at the mouths of all the rivers, and are particularly discernible in the great estuary of the Pechora. Vast numbers of erratic blocks and similar drift are spread over the greater part of Northern Russia, evidently transported from Finland, Lapland, and Sweden.

*Minerals.*—There are numerous and valuable. Gold is obtained in large quantities, both by mining and washing, on the slopes of the

## **RUSSIA.**

**1. The Cathedral of the Annunciation, Moscow.**

**2. The Kremlin, Moscow.**

## RUSSIA

**Ural Mountains.** The richer deposits, however, with a few exceptions, are found on the east side of the chain, and therefore belong more properly to Asiatic than to European Russia. Gold has also been found in the northwest of Russian Lapland. Copper is found both in the Valdai and the Ural Mountains. To the west of the latter, in all the low country of Perm, are vast cupriferous deposits, from which large quantities of metal are annually obtained under the most favorable circumstances, the workings themselves being not only comparatively easy, but all the materials necessary for smelting existing in their immediate vicinity. The governments of Olonets, Viatka, Kazan, Vologda, and Orenburg have also their copper mines. Iron, the most widely diffused of all the Russian metals, is found not only among the mountains, but in the lowest marshy grounds of Finland and the northern governments, where extensive beds of bog iron ore have been formed. The principal seat of the iron manufacture is in the government of Perm, but important workings are carried on, and great numbers of blast-furnaces have been erected, in many other quarters. Near Zlatoust, to the west of the Ural, there are important limonite deposits; but east of the Ural, at Nijni Tagilsk, magnetite is worked. Lead is more sparingly diffused, and is worked chiefly in the Ural chain and some parts of Poland, particularly the vicinity of Cracow and Sandomir. It sometimes contains such a percentage of silver as to make it worth extracting. Platinum has long been worked in the Ural chain, in the most productive mines of that metal which are known to exist in the world. Zinc is worked in Poland, in the government of Piotrkov, and quicksilver is mined in the south, in the government of Ekaterinoslav. The latter government also yields a considerable amount of manganese. Salt is found in inexhaustible abundance, both in brine pits and mines. In almost every part of the vast extent of surface already described as belonging geologically to the Permian system it may easily be found, and in numerous localities is extensively and profitably worked. It is also very abundant in the southeastern steppes. Salt-peter is found chiefly in the government of Astrakhan. From the vast extent of country which has been shown to be occupied by the Carboniferous system it may be reasonably concluded that many extensive coal fields must exist. It would seem, however, that Russia in this respect bears a considerable resemblance to Ireland, where the large developments of the Carboniferous system are chiefly confined to its lower strata, and is much more remarkable for its immense masses of mountain-limestone than its productive seams of coal. The most important and most productive coal basin is that situated north of the Sea of Azov, and traversed by the river Donetz. It has an area of over 10,000 square miles, and yields bituminous coal in the west and anthracite in the south. Its production has greatly increased in recent years. Rostov and Mariupol are the ports of this region. Another valuable coal basin is that of Dombrovo, in southwestern Poland, and there is a less productive one in the south of the government of Moscow. The coal district to the west of the Ural is traversed by a line of railway. In the centre of the beet-root sugar producing country, about Kiev and Elisabethgrad,

is another vein of coal. With the increase and improvement of railway communication the output of coal has shown a marked increase. For 1868 the output for Russia (Poland excepted) was only 147,500 tons; in 1872 it reached 530,000 tons; and in 1899 it had increased to 1,370,000 tons. The chief obstacle to a more general use of coal throughout the empire is the expensiveness of transport by rail, which frequently even surpasses the price of the coal. For the smelting of metals the boundless forests furnish a more valuable and convenient material; and many years must elapse before these can be so much thinned as to make either the search for coal or the working of it objects of paramount importance. Naphtha springs are found in the province of Archangel, in that of Samara and elsewhere, but the better known and richer naphtha or petroleum springs are situated to the north and south of the Caucasus range, especially in the country around Baku. In this region there are immense underground stores of the valuable fluid, and the petroleum industry has developed enormously in recent years, so that since 1868 the output of Russian petroleum has exceeded that of the United States. In 1891 the United States produced 62 per cent, Russia 38 per cent of the total, while in 1901 the United States produced 38 per cent, and Russia 62 per cent, the situations being exactly reversed in ten years. The only other mineral products deserving of notice are quarries of granite and marble, both of which of excellent quality, are found near the shores and to the northeast of Lake Ladoga; and kaolin, which is worked in the governments of Kherson and Chernigov.

**Climate.**—As the country extends over 35 degrees of latitude, from the warmer regions of the temperate far into the regions of the frozen zone, it exhibits several marked diversities of climate, usually considered in four divisions—a polar region, including all the country north of latitude 67°; a cold region, extending from latitude 67° to 57° N.; a temperate region, from latitude 57° to 50° N.; and a warm region, from latitude 50° to 37° N. The characteristic features of the climate in general are a greater coldness and variability than is common under the same latitudes in the more westerly parts of Europe. The mean annual temperature of the upper part of the Norwegian coast to its extremity at the North Cape is above the freezing point, whereas a considerable portion of Russia within the same, and even in a lower latitude, is below it. This is true of the whole of Russian Lapland as far south as 66°; and to the east of the White Sea the thermal line, indicating a mean annual temperature of freezing, descends so rapidly that on reaching the Ural Mountains it is found to be as low as 60°. The region to which the name of cold has been given has a mean annual temperature varying between 32° and 40°, but very unequally divided throughout the year, the cold in winter often sinking the thermometer to 30° below zero, or 62° below freezing, while the summer heat often raises it above 80°. At Saint Petersburg, considerably below the centre of this region, the mean annual temperature is rather above 40°; on the other hand, that of Kazan, situated at the very south extremity of the region, but much farther inland, is rather

## RUSSIA

below 36°. The temperate region, situated between lat. 57° and 50° N., has a mean annual temperature varying from 40° to 50°, and includes within it the far finest part of the Russian territory, though even there the thermometer has a very wide range, the summer heat, which suffices to grow melons and similar fruits in the open field, being often succeeded by very rigorous winters. The warm region, extending from 50° southward, well merits the name from its extreme summer heats, the thermometer in June and July standing commonly about 100°, and often considerably higher. It is not, however, free from the remarkable contrasts which a Russian summer and a Russian winter exhibit; for the Sea of Azov, situated almost in the heart of this region, usually freezes about the beginning of November, and is seldom open again before the beginning of April. In all the countries bordering on the shores of the Baltic Sea and the Arctic Ocean, and bounded on the west and north by the basin of the Volga, the air is charged with a superabundance of moisture, which descends in mists and frequent falls of rain or snow. Toward the centre, and still farther east, the superabundance of moisture disappears, though enough still remains to keep vegetation in full vigor even at the hottest season. Still farther south the want of rain is often felt, and long-continued droughts do frequent mischief. In general, however, the climates of all the regions are not unfavorable to health.

**Forestry and Flora.**—Forests are found chiefly in the more northern governments, particularly Archangel, Vologda, and Perm, and cover about 30 per cent of the total area of European Russia. In many of the central and southern governments a deficiency of timber is seriously felt, and many extraordinary expedients are resorted to in order to obtain adequate supplies of fuel. The governments most imperfectly provided with wood are Esthonia, Bessarabia, Kherson, Ekaterinoslav, and Astrakhan. The prevailing trees of the northern forests are fir, larch, alder, and birch. The oak is seldom found beyond lat. 61°. A considerable proportion of the surface still continues almost in a state of nature; and, where it is well wooded, it is a question whether any other mode of occupation would be equally productive. Russia possesses a vast number of phanerogamous plants, but the examination which botanists have made is incomplete and it is probable that many remain to be discovered.

**Fauna.**—Animals, both domestic and wild, are numerous in Russia. Among the latter are the bear, the wolf, wild hog, the desman, the mole-rat, the saiga, the bobak or Russian marmot, the elk, the bison, the lynx, and various animals which are hunted for their furs. Wild fowl abound, particularly near the mouths of rivers; among them the pelican frequents the shores of the Black Sea. Both on the coasts and in the rivers a great number of productive fisheries are carried on. In the Arctic Ocean whales are killed, and vast numbers of seals are taken. The rivers of the Caspian, particularly the Ural and Volga, and the Sea of Azov, are celebrated for their sturgeon. In the same quarters are also important salmon fisheries.

**Land Tenure.**—The political divisions of the Russian people comprise numerous grades of nobility, which are partly hereditary and partly

acquired by military and civil service, especially the former, military rank being most highly prized in Russia. The clergy, both regular and secular, form a separate privileged order. The higher clergy were formerly possessed of great wealth, but much of their property was confiscated by Catherine II., who compensated them by state pensions. Previous to the year 1861 the mass of the people were serfs subject to the proprietors of the soil. The Emperors Alexander I. and Nicholas took the same initial steps toward the emancipation of this class; but a bold and complete scheme of emancipation was begun and carried out by Alexander II. The decree of emancipation was dated 3 March 1861, and began to come into execution within two years. There were about 22,000,000 of serfs belonging to private proprietors, and rather more than that number on the crown lands. By an imperial decree of 8 July 1863, lands were granted to the peasants on all the estates of the crown on a 49 years' rental equal to the former poll-tax, and as a freehold estate at the expiration of this period. A similar arrangement was made on behalf of the peasants on the lands of private proprietors. The redemption money of the serfs with their land was estimated at 16½ years' purchase of their annual produce. Twenty per cent of this had to be paid by the serfs on procuring their emancipation, the remaining 80 per cent is guaranteed by the government, which levies it from the peasantry in a tax extending over 49 years. The emancipation of all the serfs on these terms was arranged for by July 1863, and from that date this form of servitude has ceased to exist in Russia. Since this change the cultivable land in Russia is mainly distributed among three classes. The crown holds nearly 35 per cent, the emancipated peasants about 20, while the remainder, with the exception of mines and town lands, is in the hands of the nobility and other landed proprietors.

**Agriculture.**—Russia is decidedly an agricultural country. Its progress in the science of agriculture has been slow, and the amount of produce obtained is due more to the natural fertility of the soil than to any ability displayed in extracting it; there being perhaps no country in Europe in which so much grain is obtained at so small an expense of skill and labor. In Livonia, however, and the Baltic provinces generally, and in some of the more celebrated wheat districts of the Ukraine, an improved husbandry has been introduced, and government, by the appointment of agricultural chairs in the universities, and the formation of model farms, is laudably endeavoring to extend the movement to other quarters. After deducting all the regions where the rigors of the climate, without making the growth and ripening of grain absolutely impossible, are incompatible with its culture as a regular branch of industry, vast tracts of land remain, where the soil is almost of inexhaustible fertility, and all the cereals are produced in such abundance as not only to meet the home consumption but leave a large surplus for export. The most important crops raised for food are rye, wheat, barley, oats, buckwheat, maize, and potatoes; and for other purposes, hemp, flax, hops, tobacco, and beet-root for sugar. The principal wheat districts are parts

of Poland, particularly the governments of Warsaw, Radom, and Lublin; the fertile alluvial tracts along the banks of northern rivers; and the governments of Volhynia, Podolsk, Kiev, and Poltava. Rye, from its natural adaptation to the soil, and its almost universal use as an article of food, is cultivated in every quarter up to lat. 65°. Barley ripens in lat. 67°, but is in far less general repute than rye. Oats are extensively grown in several governments, and more especially in the rich alluvial tracts of Archangel, where the peasants, after satisfying their own wants, grind the surplus into meal, and export it in considerable quantities to the coast of Norway. Maize forms one of the most important crops of Bessarabia, where a return of sixty-fold is said not to be uncommon. Potatoes are largely grown in Saratov, in Poland, and in the districts which border the Baltic; in the last partly for food, but much more for the supply of numerous distilleries, which are employed in converting them into brandy. Both hemp and flax are staple products. The former is grown to an immense extent in all the governments which border on the Ural chain, and on both sides of the upper course of the Volga, particularly in the governments of Tver, Yaroslavl, and Kostroma. Flax is also cultivated to a great extent in the same districts, but more especially in the governments of Olonets, Vologda, Livonia, and the southern parts of Finland. Both their fibre and their seed form most important articles of export from the ports of Riga, Saint Petersburg, and Archangel. Kitchen gardens, in many parts, attract considerable attention, and cabbages, turnips, carrots, and onions are occasionally cultivated on an extensive scale; in some of the districts bordering on the southern steppes the watermelon thrives amazingly, attaining immense size with little culture, and, while in season, forms a principal food of the lower classes. In Astrakhan, on the banks of the Volga, licorice grows with a luxuriance unknown elsewhere, and furnishes juice sufficient to form an important article of export. Few fruit trees are found beyond latitude 56° and their regular culture cannot be profitably carried on beyond latitude 53° N. There apples, pears, and plums become tolerably abundant; and farther south peaches, apricots, quinces, almonds, and pomegranates become common fruits. The vine and mulberry also are extensively cultivated, and considerable quantities both of wine and silk are obtained. In the Crimea extensive vineyards have been formed with plants selected with the utmost care, and several of the wines have already acquired a high name. Other governments have imitated the example, and the export of wine promises to become an object of great national importance. Among the principal districts in which the culture of the vine is regarded as an object of primary importance may be mentioned Bessarabia, Kherson, Kiev, Astrakhan, and the Don Cossacks. The last makes large quantities of a wine resembling champagne, which finds a ready sale in Saint Petersburg, Moscow, and many of the larger towns.

**Stock-raising.**—Horses of various breeds are raised, of which those in the north are generally small, but hardy; those of the central and south provinces large and well adapted for draft; and those of the Cossacks remarkable

for their spirit and endurance of fatigue, and their admirable adaptation for light cavalry. On several of the steppes horses still run wild. Cattle are much used, particularly in the south, for agricultural operations, and exist in such numbers that tallow and hides form very important articles of export. The best breeds are those of the Ukraine, Archangel, Bessarabia, and Grodno. In Livonia a great number of excellent cows are kept for the dairy, and much good cheese is made. The sheep are chiefly of three breeds—the original Russian, which is found in vast numbers in every part of the country, and though generally inferior, and producing a very indifferent wool, has been greatly improved by crossing with the merino and Saxon; the Kirghiz breed, remarkable for large size, a darkish-red color, long, but coarse wool, and more especially for their ponderous tails, from which from 30 pounds to 40 pounds of tallow are obtained, and existing in vast numbers on the steppes of the Volga; and the Circassian breed, not confined to the Caucasian provinces, but widely diffused in the Crimea, and among the Cossacks of the Black Sea and of the Don. The improved breeds of sheep are found especially in the Baltic governments of Livonia, Esthonia, and Kurland, but are rapidly spreading into other quarters. Goats are numerous in the south, where they are valued chiefly for their skins, which are used in making morocco leather. In some districts Angora goats are kept for their fleeces, which are remarkably fine, and manufactured into shawls. In the northern regions, bordering on the Arctic Ocean, large herds of reindeer are kept; and in the south, at the opposite extremity, among the Tartars of the Crimea and the inhabitants of the Caucasus, the camel is often seen.

**Commerce.**—Russian commerce is now very extensive. The chief trade is with Great Britain and Germany. Above a fifth of the exports go to the former, and the latter supplies about 40 per cent of the imports. The principal exports are timber, oats, flax, and tow, wheat, barley, eggs, and linseed. Raw cotton for manufacture is imported annually to the value of from \$30,000,000 to \$50,000,000. Wool and silk are also imported, as well as coal, machinery, iron, copper, lead, and ships. Besides Great Britain and Germany, a considerable trade is carried on with the United States, France, Austria-Hungary, Sweden and Norway, Egypt, Belgium, Italy, Turkey, and Denmark, as well as with China, Persia, and other eastern countries in tea, silk, etc., in exchange for furs, leather, and fabrics of European manufacture. The values of the general exports and imports (exclusive of specie) of European Russia for five recent years were:

| Years      | Exports       | Imports       |
|------------|---------------|---------------|
| 1896 ..... | \$413,186,000 | \$351,318,000 |
| 1897 ..... | 433,972,000   | 316,000,000   |
| 1898 ..... | 439,602,000   | 379,476,000   |
| 1899 ..... | 376,168,000   | 390,288,000   |
| 1900 ..... | 499,852,000   | 373,822,000   |

**Manufactures.**—In a country where so much land remains to be taken into cultivation, and population is very much scattered, manufactures cannot be expected to be carried on upon an extensive scale, except in a few leading towns. Considering the unfavorable circumstances the

## RUSSIA

progress of Russia in manufactures is much greater than could have been anticipated, and certainly much greater than it could have been had not the government done the utmost to promote it, both by the establishment of large model manufactories and various other modes of encouragement. The branches in which most progress has been made are leather, both ordinary and morocco, the latter particularly at Astrakhan, Torjok in the government of Tver, Kazan, and Taurida, in all of which the article produced is unsurpassed in any other country in Europe; cotton twist and cotton goods at Saint Petersburg, Moscow, and in the governments of Vladimir, Kostroma, and Piotrkov; woolen and linen goods in many parts of Poland, the governments of Kiev, Ekaterinoslav, Moscow, Kaluga, and most of the principal towns; silks, particularly in Saint Petersburg and Moscow; sail-cloth, at these two capitals, and also in the governments of Archangel, Riazan, and Novgorod; fine cashmere shawls, in the governments of Penza and Ekaterinoslav; fine carpets, at Kamenakoi, Smolensk, and Kurak; cordage at Archangel and in the government of Orel; metals, more especially iron and copper, in the government of Perm, and many other localities; firearms and cutlery, in the governments of Tula, Nijni-Novgorod, and Vladimir; swords and edged weapons near Zlatoust, in the government of Ufa; plate-glass and crystal, at Saint Petersburg, Tula, Tver, and in the Donetz basin; paper, at Moscow, Saint Petersburg, Yaroslavl, Kaluga, and in Livonia; hosiery, at Sarepta and various other places; and oil, candles, soap, glue, tobacco, window glass, glass bottles, etc., in almost every important town. The total number of persons employed in manufactories, mines and other establishments as recently given was about 2,100,000, the yearly production being valued at \$225,000,000.

*Shipping and Navigation.*—The mercantile marine of Russia on 1 Jan. 1901 consisted of 3,038 vessels with an aggregate of 633,819 tons; this included 745 steamers of 364,300 tons, 715 sailing vessels aggregating 91,270 tons, and 126 steamers of 49,258 tons belonged to the Baltic; 416 sailing vessels of 24,100 tons, and 42 steamers of 8,396 tons belonged to the White Sea; 635 sailing vessels of 42,843 tons and 316 steamers of 186,774 tons belonged to the Black Sea and the Sea of Azov; while 527 sailing vessels of 111,246 tons and 261 steamers of 119,932 tons belonged to the Caspian Sea. In 1901, 1,109 Russian vessels of 727,000 tons aggregate and 3,087 foreign vessels of 3,049,000 tons aggregate, entered the ports of European Russia; and 1,349 Russian vessels aggregating 713,000 tons and 7,441 foreign vessels aggregating 6,823,000 tons cleared the same ports.

*Canals and Railways.*—Considering the vast extent of country, the seaports are numerous, being Archangel, in the Arctic Ocean; Saint Petersburg, Revel, Helsingfors, Libau, Riga in the Baltic; Odessa, Nicolaiev, Sebastopol, Theodosia, Batoum, Poti, Kertch, Mariopol, and some minor ones in the Black Sea; Taganrog and Rostov in the Sea of Azov; and Astrakhan, Baku, Petrovsk, Derbent, Krasnovodsk, Usun Ada in the Caspian. The great distances at which the seas containing these ports are situated from each other

and from the interior of the country must have confined the foreign trade within very narrow limits had not a remarkable number of internal feeders been provided, partly by nature and partly by art; by nature, in the magnificent streams which wind across the country in all directions, and owing to the general flatness of the surface are well adapted for navigation; and by art, first in the great system of canals by which the different basins to which these rivers belong have been made to communicate with each other, so as to give a continuous navigation from the Arctic Ocean to the Black Sea, and from the Baltic to the Caspian; together with a network of branch canals, by which all the great towns of the interior have ready access to their outports and to each other; and secondly in the system of railways, by which internal commerce will eventually be more thoroughly opened up. The railway system was begun by the Emperor Nicholas, and has been carried out more fully and comprehensively under his successors. Some of the lines are formed directly by the state, others by private companies under guarantees from government. The greatest railway undertaking in the empire is the Trans-Siberian line, now practically completed, from Chelyabinsk to Vladivostok and Port Arthur. The total length of railways open for traffic in the end of 1901 (including Asiatic Russia) was 36,526 miles, of which about 23,400 miles were state railways. European Russia had 27,500 miles of railway. Among the most important lines in operation are that which unites Saint Petersburg and Moscow with Warsaw, and through it with the railway system of Europe; the lines from Moscow to Nijni-Novgorod and Riazan, from Orel to Vitebsk, Voronezh to Rostov on Don, Dunaberg to Vitebsk, Kerek to Kiev and to Kharkov, Kharkov to Azov, and the line from Odessa to the interior.

*Money, Weights and Measures.*—The present currency system of Russia was fixed by laws passed in 1863 and 1897. The unit of account, represented by a silver coin, is the ruble of 100 kopecks, valued at 51 5/8 cents. There are three gold coins, the imperial (15 rubles and 10 rubles), 7.50 and 5 rubles. Besides the ruble the following are coined in silver: half-ruble or poltinnick (50 kopecks), quarter-ruble, and pieces of 20, 15, 10, and 5 kopecks. The copper coins are 5, 3, 2, 1, 1/2, and 1/4 kopeck. The law of 1897 fixed the currency on a gold basis. The ruble as the fifteenth part of the gold imperial is the unit in all payments and business transactions. The circulation of the silver pieces representing 1, 1/2, and 3/4 ruble is limited by a ukase of 1898 to three rubles per head of the population, and in ordinary transactions these coins are legal tender up to 25 rubles only. Notes of the value of 1, 3, 5, 10, 25, 50, 100 and 500 rubles are issued by the State Bank. By a ukase of 1897 the issue of paper money was restricted. Up to six hundred million rubles, the bank must secure its issue of notes by a gold reserve representing half the issue, and beyond that amount the gold reserve must be equal to the issue, ruble for ruble. Since 1877 the monetary unit of Finland has been the mark, equal to a franc. The coins in-

**RUSSIA.**

**S. J. DE WITTE,**  
**EX MINISTER OF FINANCE.**

clude 20-mark and 10-mark gold pieces; 2-mark, 1-mark,  $\frac{1}{2}$ -mark, and  $\frac{1}{4}$ -mark silver pieces; and three smaller bronze pieces. One mark is equal to 100 penni (singular, penni). Silver is a legal tender only up to ten marks. The Russian unit of length is the foot, equal to the British foot, and like it divided into 12 inches. Higher units are the arshin, equal to 28 inches; the sajen, equal to seven feet; and the verst, equal to 500 sajens or 3,500 feet. A desiatine is equal to 2,400 square sajens, or nearly 2.7 acres. The standard of capacity for liquids is the shtof, equal to 2,706 pints or 93.86 cubic inches. A vedro is equal to 10 shtofs. The unit of capacity for dry goods is the chetvert, equal to 5,774.835 gallons. The pound, or unit of weight, is slightly greater than nine tenths of a pound avoirdupois. Forty pounds are equal to one pood. In 1886 the metric system of weights and measures was introduced into Finland.

**Banking.**—The continual fluctuations in the value of the paper ruble, and the troubles therewith, were ended in 1895 by the Ministry of Finance introducing a regular value for the paper currency, and by the law of 29 Aug. 1897, authorizing the issue of paper currency under certain conditions by the State Bank. (See MONEY, WEIGHTS, AND MEASURES.) The Bank of Russia acts in the double capacity of state bank and of a commercial bank, and has 113 branches throughout the empire. On 1 Jan. 1903 its assets were approximately \$907,516,000; its liabilities including a capital and reserve of \$87,500,000, were \$907,776,500. In 1902 there were 5,629 state, municipal, and postal savings banks with 3,935,773 depositors, and deposits amounting approximately to \$361,491,000. There were also 241 municipal banks, 133 societies of mutual credit, 42 banking companies, and 47 mortgage banks, the latter including state banks for mortgage loans to the nobility, and land banks for the purchase of land by the peasants.

**Government.**—The emperor (the *tsar* or *tsar*) is an absolute ruler having entire control of the legislative, executive, and judicial functions of government, and being irresponsible for their exercise. Since the time of Peter I. the *tsar* has been head of the church. The title *tsar* was borne by the emperors until the time of Alexander II., who with his successors prefer to adopt the title of emperor. By a decree of Peter I. in 1722 the sovereign was authorized to elect his successor, without regard to the law of primogeniture. This was altered by Paul I., who in 1797 fixed the succession according to the law of primogeniture, with preference to the male line. Alexander I. recognized the duty of the emperor to govern according to law, and the right of the senate to remonstrate. It is a fundamental law of the realm, established by Peter I., that the sovereign and the royal family must be members of the orthodox Greek Church. By a decree of Alexander I. the issue of any member of the royal family marrying without the consent of the emperor forfeit the right of succession.

The administration is conducted under the control of the private cabinet of the empire by four great councils. The council of the empire, established on its present organization by Alex-

ander I. in 1810, consists of the ministers *ex officio*, the princes of the imperial house, and an unlimited number of members appointed by the emperor. It meets collectively under a president, and is also divided for administrative purposes into four sections, each of which has a separate president. The sections severally superintend the departments of legislation, civil and church administration, finance and industry.

The senate, established by Peter I. in 1711, is the high court of justice of the empire, and controls all the legal tribunals. It is divided into six sections, which administer the affairs of different provinces. All the sections now sit at Saint Petersburg. The senate consists of men of rank, not exclusively of the legal profession. Each section is presided over by a lawyer, who signs its decrees as the representative of the emperor. The minister of justice presides in the meetings of the whole senate. This court has the power to audit public accounts, the patronage of numerous offices, and the right to remonstrate with the emperor.

The Holy Synod, established by Peter I. in 1721, superintends the religious affairs of the empire. It comprises the metropolitans of Saint Petersburg, Moscow, and Kiev (president), the archbishops of Georgia and of Poland, and several bishops sitting in turn.

The committee of ministers is divided into eleven departments, each presided over by a principal minister and member of the council, who are assisted in the departmental work by subordinates. The various ministries are the imperial house, foreign affairs, war, navy, interior, public instruction, finance, justice, agriculture, public works, general control.

There are also imperial cabinets dealing with charitable affairs, public instruction of girls, petitions, and one dealing in sections with economy, mines, manufactures and legislation. Yielding to the popular demand for self-government, Nicholas II., 19 Aug. 1905, issued a manifesto granting a National Duma or Consultative Assembly (*Gosoudarstvennaya Duma*) of elected representatives from the whole of Russia, to take an active part in the elaboration of laws and discussion of measures for the welfare of the empire. See *History*.

**Finance.**—The chief sources of revenue are direct taxes, indirect taxes (customs, etc.), posts, telegraphs, mines, spirit monopoly, railways, and forests, and the principal items of expenditure are those represented by administration, public debt, army, navy, pensions, and railways. The total estimated revenue for 1902 was \$973,285,990, of which \$900,392,240 represented ordinary revenue. The total expenditure was made to amount to the same sum, and included \$887,956,740 of ordinary expenditure. The ordinary revenue thus exceeded the ordinary expenditure by about \$12,500,000. The total public debt on 1 Jan. 1901 amounted to \$3,105,280,000, much of it representing railway obligations. The debt charge included in the expenditure of 1902 amounted to \$143,230,000. The revenue and expenditure of Finland in 1901 were balanced at \$21,336,725, and the debt was \$22,289,775 almost all contracted since 1889.

**Army.**—The Russian army is recruited mainly by conscription, and its organization has been determined by laws passed in 1874, 1876, 1888, and 1893. All able-bodied males are liable

to military service from the age of 21 completed to the age of 43 completed, with the exception of doctors and teachers (in time of peace) and of the Christian clergy. The period of service comprises 18 years in the active army, of which four (five for the cavalry, horse-artillery, engineers, and some others) are passed with the colors, the rest in the reserve, while during the remaining four years required to complete his forty-third year the soldier belongs to the first section of the territorial army, which includes also those not drawn for active service during the whole 22 years of their liability. The second section of the territorial army includes all those drawn for service but not incorporated, for some reason, in the permanent army. The Cossack army is organized differently, and liability to service begins on the completion of the 18th year. The period of service is diminished in the case of those who possess certain educational qualifications. There are 25 army corps, namely, the guards (Saint Petersburg), the grenadiers (Moscow), 21 territorial corps having their respective headquarters at Saint Petersburg, Grodno, Vilna, Minsk, Warsaw (3), Simferopol, Odessa, Kiev (2), Kharkov, Kovno, Vinniza, Smolensk, Lublin, Vitebsk, Moscow, Dorpat, Brest-Litovsk, and Riga, and the first and second corps of the Caucasus, with headquarters at Alexandropol and Tiflis respectively. Most of these corps are formed of two divisions of infantry, two brigades of field-artillery, one division of cavalry, and one section (two battalions) of horse-artillery, but the guards and the grenadiers have three divisions of infantry and three brigades of artillery, and the guards corps has two cavalry divisions and one brigade of horse-artillery, while the numbered corps also present some irregularities. There are also two cavalry corps, with two divisions each, having their headquarters at Warsaw. The total strength of the European army organized in the corps formations is therefore 52 divisions of infantry, 22 divisions and two brigades of cavalry, 52 brigades of field-artillery, and one brigade of horse-artillery. In time of war an army corps consists of two infantry divisions (each 18,000 men) and one cavalry division (4,000 men), comprising altogether 40,000 men. Each infantry division in war includes cavalry, artillery, etc., and each cavalry division includes artillery. The strength of a battalion is about 500 in peace and about 1,000 in war. The following table shows the approximate effective war strength of the Russian army in 1900:—

|                  | Infantry  | Cavalry | Artillery | Engineers | Train  |
|------------------|-----------|---------|-----------|-----------|--------|
| Field Troops...  | 1,019,300 | 123,800 | 122,300   | 47,100    | 26,400 |
| Reserve Troops   | 691,300   | 99,300  | 46,670    | 10,300    | .....  |
| Fortress Troops  | 162,600   | .....   | 81,300    | 12,400    | .....  |
| Reinforcements   | 285,000   | 42,900  | 38,600    | 7,440     | .....  |
| National Defense | 693,600   | 22,350  | 28,450    | 4,100     | .....  |
| Others.....      | 41,000    | .....   | .....     | .....     | .....  |
| Total.....       | 2,893,000 | 294,350 | 317,720   | 81,740    | 26,400 |

The grand total of all arms is 3,615,410, of whom 66,410 are officers. The fortresses of Russia are Alexandropol, Batum, Brest-Litovsk, Cronstadt, Dyinsk, Dünamünde, Ivangorod, Kars, Kertch, Kiev, Kovno, Libau, Novogorodsk, Odessa, Ossovietz, Ochakov, Poti, Saint Peters-

burg, Segri, Sevastopol, Sveaborg, Warsaw, Vladivostok, and Viborg.

**Navy.**—In 1901 the strength of the Russian navy was as follows, vessels in course of construction being included:— Battleships, 24 (7 first-class, 15 second, 2 third); coast-defense vessels, 9 (4 modern); armored cruisers, 3; first-class cruisers, 2; other cruisers (protected or belted), 16; torpedo gunboats, etc., 9; destroyers, 30; first-class torpedo boats, 43; other torpedo boats, 150; submarines, 1; and steam-yachts, training-ships, etc. The total personnel of the Russian navy is about 46,000.

**Ethnology.**—Ethnologically the peoples of Russia are comprised under two of the great divisions of the human race—the Caucasian and the Mongolian; but under each a considerable number of varieties are traced. The Mongolian stock in European Russia is represented by the Finns and their allies, and by the Kalmucks, who occupy some of the southeastern steppes, but have lost many of their distinctive features by intermarriage with Caucasians. Of the Caucasian stock the Slavonians, under the names of Russians, Poles, Lithuanians and Letts, Wallachians and Servians, form about nine tenths. Of these again, the Russians proper form the great body of the population, and are estimated at about 50,000,000. They occupy, with little intermixture, the central provinces between the Dnieper and Volga; form a vast majority in the north, between the Ural Mountains and the White Sea, and, in the south, between the Don and the Dniester; and are found, more or less intermingled with other varieties, in all other parts of the country. The Poles are found in the greatest number in their own country. In that part of it which in the dismemberment fell to the share of Russia they amount to about 9,000,000. The Lithuanians are found chiefly in northern Poland, and in the governments of Vilna and Minsk. They are estimated at about 1,500,000. Still farther north are the Letts, or as they are often called, the Kurs, from living chiefly in Courland. They are also the chief occupants of Livonia, are wholly devoted to agricultural pursuits, and may amount to 300,000. The Wallachians, and among them a few Servians, are found only in Bessarabia, between the Dniester and Pruth. Their language is a descendant of Latin mixed with foreign words. They, too, do not exceed 300,000. The Tchudes, or Finns, though they belong to the Mongolian race, have little or none of the characteristic Mongolian type of countenance. They are of middle size, fair complexion, and generally have light hair and blue eyes. They are settled on both sides of the Gulf of Finland, but on the north of the gulf form the two marked divisions of Finns proper and Laplanders, the former living south and the latter north of lat. 65°. To the south of the gulf the Finns occupy the far greater part of Esthonia and a small part of Livonia. Widely separated from the western Finns, though the mode of separation is not known, a great number of Tchudt or Finnish tribes are found occupying the western slopes of the Ural Mountains and the banks of the Middle Volga under the names of Syrians, Permians, Voguls, Votiaks, Tchuvasses, Tchermisasses, Mordwins, and Teptiars. The most numerous are the Tchuvasses and Tchermisasses, who live together on both sides of the Volga,

THE CZAR REVIEWING A RUSSIAN REGIMENT.

In the neighborhood of Kazan, and are estimated at about 500,000. All the others do not exceed the same number. The second great branch of Mongolians inhabiting Russia are the Tartars, who here form four distinct tribes—the Tartars of Kazan, in some respects the most civilized nation in Russia, though the great majority of them still cling to Mohammedanism, and numbering about 230,000; the Bashkirs, occupying both sides of the Ural Mountains from lat. 56° to 54° N., still given to wandering life, and amounting to about 130,000; the Nogais, occupying a large part of the Crimea and the steppe to the north of it, dispersed over the country east of the Sea of Azov and the northern base of the Caucasus, and amounting in all to about 600,000; the Metcheraks, forming a few small tribes, not exceeding 20,000 persons, live among the Bashkirs. The German or Teutonic race inhabiting Russia consist chiefly of Germans and Swedes, intermixed with a few Danes. The Germans are dispersed over the Baltic provinces south of the Gulf of Finland, among the Letts and Estonians, where they constitute the greater part of the nobility. They are also numerous in Saint Petersburg, Moscow, and other mercantile towns and seaports, and a considerable number of German colonists are settled in the government of Saratov and other parts of the Middle Volga. The Swedes are numerous both along the eastern shores of the Gulf of Bothnia and the northern shores of the Gulf of Finland. Their number in these localities, and more particularly in Esthonia, is supposed to exceed 100,000. The Greeks, dispersed over all the southern provinces as merchants, and in the Crimea, where they are the sole occupants of several villages, are estimated at about 500,000. There are also the Jews, who are seldom found in the central and northern provinces, but are very numerous in ancient Poland, particularly in the governments of Vilna, Grodno, Volhynia, and Podolsk, where they form the far greater part of the urban population. Their number is supposed to exceed 2,000,000.

**Population.**—As given in the table of the official divisions of the empire, the total population according to the census of 1897 was 129,004,514, of which 106,864,136 were resident in European Russia. The average proportion of women to men is 99.8 women to 100 men, although in the Russian provinces and Finland it is respectively 102.8 and 102.2 women to 100 men. The natural annual increase is over 1,700,000.

**Education.**—About \$20,000,000 per annum are expended by the State on education. Including secondary and primary schools, the number of educational establishments maintained wholly or in part by government amounts, so far as can be ascertained, to about 50,000, the pupils numbering about 2,300,000. The country is divided into educational districts, but the organization of the means of education is as yet little more than adequate for the education of public officials, and the great mass of the population is wholly uneducated. There are universities at Moscow, Saint Petersburg, Kiev, Kharkov, Yuryev, or Dorpat, Warsaw, Kazan, Odessa, and Tomsk. In Finland; which has a separate system, education is nearly universal, and there is a university at Helsinki.

**Religion.**—The established religion of Russia is that of the Eastern or Greek Church. (See *ГРЕЦКАЯ ЦЕРКОВЬ*.) The Russian Church is established independently under the emperor as supreme and the Metropolitan of Novgorod as ecclesiastical head. It maintains friendly communion with the patriarchates of Constantinople, Jerusalem, Antioch, and Alexandria, and recognizes the authority of the joint patriarchate and of the councils of the whole Eastern Church in matters of doctrine. Religious toleration cannot be said to prevail in Russia, except in favor of foreigners. The members of the orthodox church are not allowed to change their creed. There are, however, considerable sects of schismatic Greek Churchmen. The Greek Church, all sects included, is estimated to number in European Russia 75,000,000; the Roman Catholics, 8,300,000; Protestants, 2,950,000; Jews, 3,000,000; Mohammedans, 2,600,000.

**Judiciary and Local Government.**—Various parts of the empire are governed by different codes, the laws and institutions of Finland and Poland being partly respected, the former having a quasi-independent form of government. The provinces are under general governors, who exercise a general control of the administration in the name of the emperor. Zemstvos or district and provincial assemblies since 1866 administer the economic affairs of their respective districts, and to them are due much of the reform inaugurated since that date. The country is subdivided into *mirs* or communes, which have the free administration of local affairs. Finland has nominally preserved its ancient constitution with a national parliament of four estates, but is really governed by a governor-general and senate appointed by the emperor. Poland was finally incorporated with Russia in 1868. A voluminous code, called the *Svod Zakonow* or *Corpus Juris*, has been drawn up for the empire, and declared to contain the law of Russia in so far as not modified by the laws and privileges of particular provinces. It contains an abstract of all the laws and ordinances issued by the different emperors from 1649 downward, and forms 13 large volumes. The laws and ordinances in full, but reaching only to 1832, are contained in 56 volumes; of this immense collection eight volumes belong to the first seven years of the reign of the Emperor Nicholas I.

**Language.**—The Russian is by far the most important of the Slavic languages and it stands in close connection with the other branches of that family. Its underlying element is Slavonic, but there are additions from Mongol, German, and French sources as well as from the ancient classic languages. It may be divided into two dialects, the Great Russian and the Little Russian, the first being the vernacular in the east and centre of the empire, the second in the Ukraine. The Russian is a highly inflected language, possessing seven cases, and a large number of modal modifications for the verb. It is especially rich in augmentatives and diminutives, which, upward or down, may be carried through several degrees of intensity. A still more copious source of word formation is the susceptibility of the roots to manifold development, so that according to Shishkov as many as 2,000 derivatives are often formed from a single root. Great freedom of construction is rendered pos-

able by the free use of inflections. The standard dictionaries are Dahl, 'Dictionary of the Russian Language'; and the 'Dictionary of the Church Slavonic and Russian Languages' (1847), a new edition of which is now in the course of publication under the direction of the Imperial Academy of Science. The most important work on the grammar of the language is that of Bousslayeff (1881). In English there are: Alexandroff, 'Complete Russian-English and English-Russian Dictionary' (1897-9), and 'A Practical Method of the Russian Language' (1892); Riola, 'How to Learn Russian'; Motti, 'Russian Conversation Grammar.'

**History.**—The foundation of the Russian empire is assigned by the earliest chroniclers to Rurik (q.v.), a Scandinavian chief, who about the year 860 established himself in the city of Novgorod, summoned thither by the Slav inhabitants to bring peace to a country distracted by civil strife. A part of the Varangians, as the Northerners were known to the Slavs, advanced south and established themselves in Kiev. Rurik was succeeded in 879 by his infant son Igor, but the government was in the hands of his kinsman Oleg, who extended the Varangian power to the west and south and in 882 made himself master of Kiev, leading thence a victorious expedition against Constantinople. Igor (912-945) made an unsuccessful expedition against the Byzantines and fell in battle against one of the rebellious Russian tribes, being succeeded by his son Sviatoslaff (945-972). During half of his reign he remained under the tutelage of his mother Olga, who about 950 embraced the Christian faith. Sviatoslaff waged successful war against the Bulgarians, but met with defeat at the hands of the Byzantines and perished during a revolt of the Petchenegs. The empire was divided among his three sons, with resulting confusion, till unity was restored by Vladimir the Great or the Saint (980-1015), who, an ardent pagan in his early life, embraced Christianity about 988 on receiving in marriage Anna, sister of the Byzantine emperor, Basil II. and Constantine. Soon the nation followed the example of its ruler, who was zealous in the extension of the new faith. Kiev became the seat of a metropolitan, and Russia, in adopting the Greek confession, definitely submitted to the influence of the Byzantine civilization. Vladimir left a realm extending from the northern lakes to the Dnieper and from the Vistula to the Volga, for his eight sons to quarrel over. One of them, Sviatopolk, ruled in Kiev till 1019, but was overthrown by his brother Yaroslaff, whose power after 1034 was undisputed. Under him the process of assimilation between Varangians and Slavs attained fair completeness and we have the beginning of the modern Russian people. Yaroslav divided his dominions among his five sons who ruled at Kiev, Vladimir, Smolensk, Tchernigov, and Peryaslavl, with the ruler of the first as over-lord. This arrangement lasted but a short time and there followed 50 years of confusion, in the course of which the empire was torn up into numerous principalities whose strife prepared the way for a foreign conqueror. Noteworthy among the grand-princes of Kiev of this period are Sviatopolk (1023-1113), who waged long wars against the Polovtsians, and Vladimir

Monomachius (1113-95), who did much to improve the condition of the peasantry. Of the Russian principalities which arose about this time the most important were Kiev, which exercised an indefinite overlordship over the other states; Novgorod, extending from the southern Dvina and the upper Volga to the White Sea; Polotsk to the southwest of Novgorod; Smolensk to the south of Polotsk; Volhynia and Halicz in the west; Tchernigov between the Dnieper and the Oka; and Suzdal on the upper and central Volga. Of these Novgorod (q.v.) was the most powerful under a government which was essentially republican. It was also the richest of the Russian cities and an influential member of the Hanseatic League. In 1240 the storm of Mongol invasion broke upon Russia and in the following year the princes of Kiev, Halicz, and Tchernigov were defeated in a great battle on the Kalka. The full force of invasion, however, did not come till 1237, when Batu-Khan (q.v.) with an immense army entered Russia, took Ryzan, Vladimir, and Moscow, and overthrew the army of the Prince of Vladimir on the river Siti in 1238. By 1240 all Russia with the exception of Novgorod had been reduced and in 1242 it was placed under the authority of the Golden Horde or Khanate of Kiptchak, whose rulers made and unmade princes at their will, though no attempt was made to intervene in the internal affairs of the various principalities. The country, which had suffered fearful devastation during the conquest, was now ground down by heavy impositions of tribute, and all attempts at throwing off the foreign yoke met with bloody retribution. Novgorod, the last of the Russian principalities to submit, fell toward the end of the 13th century. The effect of the Mongol conquest on the state of civilization in Russia was deplorable and may be said to have rendered that great empire what it still remains, the most backward country of Europe, after Turkey.

Kiev and Tchernigov had been destroyed during the wars of Batu-Khan and the centre of power now shifts to the north where Vladimir for a time was the most important of the Russian principalities; the most noted of its rulers was Alexander Nevski (1256-63), who won notable victories over the Swedes and the Livonian Sword Bearers. The succeeding period witnessed Russia's deepest degradation brought about by internal strife among the princes whose dissensions served only to fix the Mongol yoke more firmly on the people. Vladimir in the course of time yielded precedence to Tver and Moscow, between which a long contest culminated in supremacy, ending in the triumph of the latter, whose period of ascendancy begins with the Grand Prince Ivan Kalita in 1328. Ivan beautified Moscow, built the Kremlin, and by winning the favor of the Khans retained the succession in his family. His son Simeon the Proud (1340-53) extended the power of Moscow, and Simeon's grandson Dmitri (1380-83) thought himself strong enough to rise against the Mongols, over whom he gained a splendid victory on the Don in 1380, acquiring thereby the surname Donatkoï. Moscow, however, was taken and burned and Dmitri was forced to renew his allegiance to the Khan. His son Vassili II. (1389-1425) raised the power of

NICHOLAS II, CZAR OF RUSSIA

Moscow to a higher point than ever and under his successor Vassili III. (1425-68) great increases in territory were made by the annexation of neighboring principalities in spite of long years of civil confusion. The power of Moscow was still further increased by the disruption of the Khanate of Kipchak into a number of independent hordes or khanates, among which the Khanate of Kazan was brought under the authority of Moscow by Ivan III. the Great (1462-1505), who in 1478 reduced Novgorod and in 1480 helped to overthrow the Khan of the Golden Horde, whereby Russia was freed from the Mongol yoke. In 1473 Ivan married Sophia, niece of the last Byzantine emperor, and, pretending to imperial honors, assumed the title of Grand-Prince and Autocrat of Russia. He made an attempt to introduce western civilization into Russia but proved less successful as a reformer than as a warrior. At his death he left a realm increased nearly fourfold by conquest in the east, the south, and the west. His son Vassili III. (1505-33) furthered the introduction of the European arts. He left an infant son Ivan IV. (1533-84), who grew up in the unfavorable atmosphere of a dissolute court and assumed personal power in 1547 at the age of 17, first making use of the title Czar. Ivan overthrew the Khanates of Kazan and Astrakhan and waged repeated wars with the Tartars of the Crimea, who in 1571 raided and burned Moscow and carried off an immense number of prisoners. He attempted to gain an outlet for Russia on the Baltic but failed against the hostility of Sweden and Poland. The establishment of commercial intercourse with England by way of the White Sea led to the coming of large numbers of western artists and mechanics who were welcomed by Ivan. In his reign, too, began the conquest of Siberia (q.v.) by the Cossack Yermak. Within the realm Ivan devoted himself to crushing out the privileges of the Boyars or nobility and to render his will absolute in every field. He succeeded in attaining his end by acts of the most fearful cruelty which earned for him the name of the Terrible. Novgorod, which attempted to make common cause with Poland, was stormed and subjected to massacre and plunder for five weeks, in the course of which 60,000 of the inhabitants are said to have perished. Ivan IV. was succeeded by the weak Feodor I. (1584-98), who left the affairs of government to his brother-in-law Boris Godunoff. The latter, aiming at the throne, brought about the death of Feodor's younger brother Dmitri, and on the death of the Czar (the last Rurik) was elected to succeed him. His rule (1598-1605) was unpopular and widespread dissatisfaction provided the opportunity for the appearance of a number of pretenders claiming to be the murdered Dmitri. The first of these, with the aid of the Polish king, overthrew Boris in 1604 and on the latter's death in the following year, was crowned at Moscow. He was dethroned and killed in the following year and Vassili Shuiski was chosen to the throne. A new pretender now appeared, Vassili was forced to abdicate, a faction of the Boyars chose Ladislus, crown prince of Poland, for their ruler, and a Polish army took possession of Moscow. There followed two years of anarchy till a national uprising headed by Minin and Pozharsky drove the Poles from the capital (1612), where-

upon Michael Romanoff, a youth of 17, was chosen to the throne by a representative assembly (1613).

The new Czar, who during the first part of his reign was under the influence of his father, the patriarch Feodor Philarete, devoted his energies to restoring order to the distracted country and concluded peace with Sweden and Poland at the cost of much Russian territory. Michael died in 1645 and was succeeded by his son Alexei Mikhailovitch (1645-76), under whom a popular revolt occasioned by the misgovernment of certain court favorites led to a thorough reform of the laws and the administration of justice, effected by the enactment of a new code, the *Uloshenie*. In the war between Sweden and Poland, which broke out in 1653, Russia, as the ally in turn of either party, met with final defeat at the hands of Sweden. From Poland, however, it obtained by the treaty of Andrussov in 1669, Little Russia east of the Dnieper, Kiev, and Smolensk. The changes effected at this time by Nikon, the patriarch of Moscow, in the dogma and ritual of the Church, though accepted by the majority of the nation, created the sect of Old Believers or Rascolniki (q.v.), who carried their hatred of innovation into the secular field and sought to combat the introduction of western civilization into the country. Alexei was succeeded by his eldest son Feodor Alexeevitch (1676-82), who continued the reform policy of his father by abolishing the old nobility of office and creating a new aristocracy in its place. Upon Feodor's death without issue, his half-brother Peter, a child of 10, was chosen Czar in accordance with the dead monarch's will. Ivan, a full brother of Feodor and a youth of 16, was passed over because of his mental infirmities. A revolt in his favor, however, led to the acknowledgment of both brothers as co-rulers under the regency of Ivan's sister Sophia, a woman of great ambition and power of will, who entered into an unsuccessful war with Turkey, repressed a rising of the Old Russian party, and the Rascolniki and, when Peter, with advancing years, began to assert his authority, plotted to bring about his death with the aid of the Streltsi, the body of royal troops first organized by Ivan the Terrible. Peter escaped from the power of the Regent and in the brief struggle which followed, Sophia was overthrown, the Streltsi were severely punished, and as Peter I. (1689-1725) the founder of Russia's greatness as a European power began his reign. Ivan retained the title of Czar till his death but exerted no influence in the government. Given in detail under his own name, Peter's services to his nation may here be closely summarized. Externally he made it his life's task to gain for Russia an outlet on the western and southern seas, the only seaport in the empire at that time being Archangel on the ice-covered White Sea in the north. The conquest of the Black Sea coast land began with the capture of Azov in 1696. A short period of peace during which the young Czar repressed a formidable uprising of the Streltsi, destroyed that famous corps and organized an army on the western model, was followed by Russia's entrance into the northern war as the ally of Poland against Sweden. Peter's army was badly beaten by Charles XII. at Narva, in 1700, but the Czar profited by ill-success, reorganized his forces, and at Pultova in 1700 over-

threw Charles, who was forced to seek refuge with the Sultan. The latter was incited to war against Russia, and in 1711 Peter, caught with his army in a trap on the Pruth River, was forced to purchase peace by the surrender of Azov. In the north, however, the Russian fortunes had prospered. Shortly after Narva Peter had made himself master of parts of Esthonia, Livonia, and Ingria, and in 1703 had laid the foundation of his new capital, Saint Petersburg, on the banks of the Neva, in territory conquered from the Swedes. By the treaty of Nystadt, in 1721, Russia was confirmed in possession of these Baltic lands, and secured in addition parts of Carelia and Finland, succeeding thus to Sweden as the leading power in the north of Europe. A three years' war with Persia during the last part of Peter's reign resulted in the conquest of a portion of the southern coastland of the Caspian Sea. Internally Peter's efforts were directed to the introduction of western civilization into his dominions and to a very great degree he was successful. The industries, schools, and arts of western Europe were brought in and forced by the Czar upon an unwilling people for their good. Far less successful was his attempt to engraft western refinement and habits of thought on a nation whose ideals were half patriarchal and half Oriental. The anomalies of the Russian character, which at the present day present so much that is puzzling to the western mind, may be traced to this artificial amalgamation process pursued by Peter the Great. To enforce his will, the Czar must of needs be absolute within his dominions and Peter carried the centralization of power to the extent of abolishing the patriarchate and vesting the ultimate control of the Church in his own person.

Peter's only son Alexei had died during his father's lifetime, and the crown passed to the wife of the dead monarch, Catharine I., who was succeeded in 1727 by Peter II., a son of Alexei. On Peter's death in 1730, the Privy Council, in which the influence of the families of Galitzyn and Dolgorouki was predominant, called to the throne Anna Ivanovna (1730-40), Duchess of Courland and a daughter of Peter the Great's half-witted brother Ivan. Defeating an attempt of the aristocracy to limit her powers, she left the affairs of government to her favorite Biron, a native of Courland, who soon aroused the hatred of the Russian party. A war with Turkey in 1735-9 resulted in the permanent acquisition of Azov, but at the same time Peter's conquests in Persia were abandoned. Anna Ivanovna died in 1740, leaving the throne to her infant grand-nephew Ivan (1740-1) under the regency of Biron. The latter, however, was speedily overthrown and Anna Leopoldovna, mother of the young Czar, became Regent with Marshal Münnich (q.v.) as her chief adviser. A conspiracy headed by the French ambassador at Saint Petersburg brought about, in the same year, the fall of Anna Leopoldovna and the entire German faction, and the elevation to the throne of Elizabeth (1741-62), the daughter of Peter the Great. Under the influence of England, Russia entered the war of the Austrian Succession as an ally of Austria and in the Seven Years' war, Elizabeth's hatred for Frederick the Great made her a bitter opponent of Prussia. The Russian armies gained victories over Frederick's generals at Gross jagersdorf

(1756), and Kunersdorf (1759), raided Berlin in the following year, and overran East Prussia. This reign is noted for the progress made in the spread of education and general culture. The University of Moscow, the first in Russia, was founded in 1755. Elizabeth was succeeded by Duke Peter of Holstein-Gottorp, a son of Peter the Great's second daughter Anna, who in less than a year fell a victim to a conspiracy of which his wife, Catharine, was the leading spirit. After Peter's death by violence, Catharine, the second of that name, ascended the throne, one of the most dissolute women of her time and one of the greatest rulers of all times. During her long reign (1762-96) Catharine II. labored incessantly for the internal development of the empire. Commerce and industry were encouraged, education was furthered, the laws and the systems of administration were reformed. Abroad the power of Russia was tremendously enhanced at the expense of Poland and Turkey. In the dismemberment of the former (see POLAND) Catharine was the leading spirit and by the threefold partition of that country, enormous territorial gains were made. In the first war with Turkey (1768-74) Russia acquired the land between the Dnieper and the Bug and the right of free navigation on the Black Sea. The Sultan renounced his overlordship over the Crimea, which soon after fell to Russia. In a second war (1787-92) Russia acquired the land between the Bug and the Dniester. Courland was annexed in 1795 on the death of its last duke. Catharine II. was succeeded by her son Paul I. (1796-1801), whose tyrannous acts, proceeding rather from a gloomy suspiciousness of character than from innate cruelty, aroused general dissatisfaction. He was assassinated by a number of the highest dignitaries of the court and the crown passed to his son Alexander, who had been a party to the projected dethronement of his father, though possibly not to his murder.

Alexander I. (1801-25) devoted the first year of his reign to carrying into effect the lofty ideals of government implanted in him by his tutor La Harpe (q.v.). Reforms in administration and the laws were enacted, the finances were partially reorganized, education was encouraged, and the condition of the serfs ameliorated in part. In the Baltic provinces villeinage was abolished. Soon, however, the Czar found himself drawn into the vortex of the Napoleonic wars. Paul I. had entered the struggle against the French Republic and the victories of the Russians under Suvaroff in northern Italy (1799) had driven the French from that region. Later Paul had withdrawn from the coalition and with Sweden, Prussia, and Denmark had formed the armed neutrality of the North aimed against the pretensions of Great Britain. Alexander I., on his accession, had made peace with England and now, in 1805, he joined the third coalition against France. The Russians shared in the disastrous defeat at Austerlitz, and in 1807, as an ally of Prussia, suffered a crushing defeat at Friedland (q.v.). In the peace of Tilsit Alexander I. and Napoleon came to terms whereby the former, in return for abstaining from intervention in the affairs of western Europe, was permitted to work his will on Sweden and Turkey. Finland was wrested from Sweden. Turkey after a six-years' war (1806-12) was forced to cede the lands east of the Pruth.

**RUSSIA.**

**THE PETROWSKI PALACE, MOSCOW.**

## RUSSIA

From Persia the Caspian coastland around Baku was acquired. The failure of Alexander I. to lend support to Napoleon's continental system brought on war between the two in 1812. There followed the invasion of Russia by the Grand Army of France, the disastrous campaign, and the pitiful retreat with its ultimate outcome in the total overthrow of the great emperor. (See NAPOLEON I.) In the rising of Europe against Napoleon in 1813 Alexander assumed the leadership. The Russian armies took a very important part in the final campaigns of 1813-14, and the terms of peace with France, the restoration of the Bourbons, and the rearrangement of the political system of Europe at the Congress of Vienna were largely the work of the Czar and of Metternich. The Congress of Vienna created the kingdom of Poland, which it bestowed on Alexander I. The Czar until his death was the most powerful monarch of Europe, whose destinies he controlled in considerable measure

of Nicholas I. was one of ruthless repression and intellectual gloom; Nicholas was an autocrat whose will was law and whose instruments were the army and the police. Abroad Russia's position was of the highest, until the very close of the reign. War with Persia (1826-8) resulted in the conquest of part of Armenia. War with Turkey (1827-9) brought about the acquisition of another portion of Armenia, and established the independence of Greece and the autonomy of the Danubian principalities. The national consciousness was stirred by the revolution of the Poles in 1830, the ancient enemies of Russia. The insurrection was suppressed with great severity and Poland was incorporated with Russia. (See POLAND.) In 1833 Nicholas I. came to the aid of the Sultan against Mehemet Ali and in 1848-9 the Russian armies aided the Austrian forces in suppressing the Hungarian revolution. In 1853 Nicholas, assuming the role of protector of the Orthodox Christians in Turkey, declared

Map showing Russian advances in Asia during the last fifty years.

through the Holy Alliance (q.v.). At home, the fair promise with which his reign had begun came to naught and the desire for a thorough reform of the state, stimulated by contact with the ideas of the French Revolution, remained unsatisfied.

Upon the death of Alexander I. without issue it became known that his brother Constantine, the next in the order of succession, had renounced his rights to the crown. Nicholas, the youngest brother of the dead monarch, refused to accept the crown until it became evident that Constantine was determined not to succeed. The uncertain condition of affairs was seized upon by a large number of officers as an opportunity for rising in arms with the purpose of liberalizing the state system. This revolution of the Decembrists, as the rebels were known, was repressed with energy by the new monarch, many of the leaders were executed and large numbers exiled to Siberia. Internally the reign

war against the Sultan, who was joined by England and France, alarmed at the growing influence of the Russian monarch. The Crimean war (q.v.) which followed destroyed the Russian ascendancy in Europe. Internally financial disorder and industrial depression did much to discredit the absolutist system under which the country had been ground down for 30 years. The demand for thorough reform became general and received answer early in the reign of Alexander II. (1855-81), who succeeded his father in the midst of the Crimean war. The series of reforms began with a reduction in taxation and the size of the standing army, the building of railways was begun, the censorship was relaxed and an influential press created; measures for the spread of education were taken. On 19 Feb. 1861 the emancipation of the serfs was decreed after three years of preliminary investigation. About 23,000,000 serfs thus obtained their freedom and with the aid of govern-

ment loans were set on the way toward acquiring ultimate possession of the lands they cultivated. Naturally the act of emancipation was not unaccompanied by disorder and dissatisfaction consequent on the sudden change from servitude to the responsibilities of freedom on the part of the peasants and in a number of ways the results were not so beneficent as had been expected; yet the liberation of the serfs was a great step forward in the development of the Russian people. It was followed by judicial reforms comprising the establishment of jury courts and by the institution of district and provincial assemblies which were intended to prepare the way for a national parliament on which all hopes of a thorough reform in the state were based. In 1863 the Poles rose in insurrection and though the uprising assumed no very formidable proportions, the strength of Russia was tried in its suppression. Like the uprising of 1831 the Polish insurrection of 1863 was followed by a great awakening of the Russian national consciousness, which took the form of a demand for the development of Russia not on western lines but in accordance with its own ethnic genius. This outburst of patriotism threw the reform movement in the background and the problems of emancipation failed to receive sufficient attention from the bureaucracy with consequent dissatisfaction among considerable classes of the population. The Nihilists (q.v.) began to agitate ideals of radical individualism and the reorganization of the state, and when the government sought to repress their activity a faction among them resorted to terrorism to bring about constitutional reforms. In 1878 began a series of personal assaults on high officials of state which led to correspondingly severe measures on the part of the government. Military rule became general in the empire and the secret police hunted down the leaders of the Nihilists who were punished with death or exile. Yet Alexander II., under the guidance of Loris-Melikoff (q.v.), was planning to meet the demands of the Liberals by summoning a national assembly, when he fell a victim to the anger of the Nihilists, 13 March 1881. The progress of the Russian arms during the reign of Alexander II. was of the utmost importance. The conquest of the Caucasus was completed in 1864, and central Asia came under the Russian authority (Tashkent, 1867; Samarkand, 1868; Khiva, 1873; Khokand, 1876). By the treaty of Aigun (1858) China ceded to Russia the territory of the Amur. In Europe the Czar, for services rendered Germany in 1870-1, succeeded in obtaining in return, the abolition of those provisions of the treaty of Paris (1856) which restricted the Russian power in the Black Sea. Revolts in Herzegovina and Bulgaria in 1875-6 led the Pan Slavists in Russia to demand intervention in behalf of the Christian population of the Balkans oppressed by the Turkish power. In 1877 Russia declared war against Turkey and a simultaneous attack was begun on the Turkish power in Europe and the Caucasus. On 27 June the Russians crossed the Danube and on 13 July Gen. Gurko crossed the Balkans and advanced to within two days' march of Adrianople. The Russian fortunes then suffered a reverse. Osman Pasha (q.v.) held out in Plevna for 20 weeks against repeated assaults until all hopes of successful resistance were gone (10 Dec. 1877).

Gurko, too, had been driven back, but in the end of December he recrossed the Balkans, and being joined by a second army which on 9 Jan. 1878 captured the Turkish forces at Shipka Pass, made an end of Turkish resistance at Philippopolis, 17 January, occupied Adrianople, and advanced on Constantinople. On 3 March Turkey concluded the Peace of San Stefano, by which Russia acquired a part of Armenia with Ardahan, Batum, and Kars. The independence of Rumania, Servia, and Montenegro was recognized by the Porte, and an autonomous Bulgarian state, extending to the Aegean Sea, erected. The terms of the treaty of San Stefano were radically modified, however, at the Congress of Berlin (q.v.) in the same year.

Alexander II. was succeeded by his son Alexander III. (1881-94), whose reign marked a sharp reaction from the liberal ideals of his father. The Czar was under the influence of the reactionaries Ignatieff, Pobiedonostseff, and Katkoff, the leader of the Old Russian party. The Nihilists were persecuted relentlessly and their repeated attempts on the life of the Czar only confirmed the monarch in his repressive course. The universities were placed under strict supervision and the policy of crushing out all nationalities within the empire but the Russian and all religions but the Orthodox was ruthlessly carried out. The censorship was re-established in all its severity. Within two or three years after the accession of Alexander III. terrorism had been well suppressed, but the subsequent development of a revolutionary labor movement took place in spite of the activity of the police. Under Nicholas II. (1894--) the policy of reaction was continued though in a somewhat modified form. The new ruler was still under the influence of Pobiedonostseff, head of the Holy Synod, and other advocates of repression against whose ascendancy his naturally enlightened impulses could but rarely assert themselves. We may find the Czar's initiative in the rescript of 1898 issued to the nations of the world and calling on them to take steps leading toward disarmament and the establishment of permanent international peace. This was followed by The Hague Peace Conference and the erection of an international court of arbitration at the Dutch capital. The policy of Russification begun under Alexander III. was steadfastly pursued under his successor, the chief field of activity being the Baltic province, Poland, and more prominently Finland (q.v.). In close connection with this policy stand the laws of exception against the Jews who, beginning with 1881, have been subjected to almost unrelenting persecution. When Finland passed to Russia in 1809 Alexander I. had guaranteed the preservation of its autonomy and its language and religion. But, though this guarantee has been renewed from time to time, it did not prevent the Russian government from beginning a determined attack on the liberties of the country. The process reached its height in 1902 when the authority of the Finnish Senate was rendered subordinate to the governor of the duchy appointed by the Czar, who at the same time was given control over the entire administration. Russian was made the official language and the destruction of the Finnish tongue was sought by the suppression of newspapers and periodicals on supposedly political grounds. All

RUSSIA.

THE CATHEDRAL OF ST. BASIL, MOSCOW.

attempts at resistance on the part of the Finns have been sternly repressed by Governor Bobrikov, and it is only a question of time when Finland shall have lost her liberties as Poland has lost hers. Milder methods of a similar nature have been pursued in the Baltic provinces where Russian has been made the language of the courts, the schools, and the universities, and even the ancient names of well known cities have been changed from German into Russian. In 1882 came the May laws, brought forward by Ignatieff, imposing numerous restrictions on the Jews in respect to rights of residence and occupation, admission to educational institutions, and eligibility to public office. Most oppressive of these provisions is the one forbidding them residence in the greater part of the empire and concentrating them within the Pale of Settlement (15 provinces) in the western provinces, where, crowded together in the towns, the great mass of them has sunk to an abject economic condition. The spirit of anti-Semitism has grown among the Russian population owing to conceived objectionable traits of Russian Hebrews, but it must be admitted that to the agitation of anti-Semitic journalists and the deliberate policy of the government must be ascribed such popular anti-Jewish outbreaks as occurred in May 1903 at Kishineff, when more than 50 Jews and a number of Christians lost their lives.

The appointment of men like Bobrikov as governor of Finland and Sipiagin as minister of the interior had shown clearly that the government intended to pursue the old policy of repression of liberal movement, and the revolutionary party again resorted to their former and favored means of retaliating the despotic measures of the government. Within the short space of two years quite a number of political murders have been perpetrated. Minister of Public Instruction Bogolepoff was killed by a student Karpovitch, soon after Minister of the Interior Sipiagin was killed also by a student, Stepan Balmashev. The revolutionary propaganda spread like fire throughout Russia and resulted in continuous strikes, riots and uprisings of peasants. In the provinces of Poltava, Kieff and Charkov peasants rose up against the landed proprietors, burned their estates and accompanied these acts by robbery and violence. Troops were sent against them and these insurrections were suppressed with ruthlessness and cruelty, reminding of the Dragonades under Louis XIV., whole villages having been given to the rapacity of soldiers. Finally the peasants were flogged into submission. In Zlatoust, Ufa province, on the Ural Mountains, the strikes assumed such proportions that the troops sent there had to kill and wound about 500 workmen. The cruelty in suppressing the strike cost the governor of the Ufa province, Bogdanovitch, his life, he having been murdered by the revolutionists in the public square of Ufa. In the beginning of 1904 the oppressive policy of General Bobrikov in Finland reached the point when patience ceased to be a virtue and he was shot dead within the walls of the Finnish Senate by the son of a general in the Russian army and a Finnish Senator, Schaumann, who, immediately after the deed, committed suicide. Only two months passed after the assassination of Bobrikov, when Minister of the Interior von

Plehve, who succeeded Sipiagin, was blown up by a dynamite bomb in the streets of Saint Petersburg. Numerous other attempts on the lives of the government officials took place within the last twelve months. Disturbances on a mass occur every day and to this are now being added the riots of the reservists who are called to the army and who do not relish the prospect of being made food for powder. The tremendous expenditure of money necessitated by the war compels the government to resort to measures for increasing the revenue, which are not only burdensome upon the impoverished and almost starved population, but are enforced in the way which is repulsive, even to the materially better classes. The commercial depression, the unrest of the population, evident unpopularity of the war with Japan—no doubt had much to do with the selection from a different class of a successor to von Plehve.

The new minister of the interior, Prince Sviatopolk Mirski, is a man of liberal mind, kind hearted, of the highest honor and a scholar. After his appointment, all of a sudden, the press obtained fairer treatment, political exiles have been returned, and the arbitrary dealing with political suspects discontinued. The articles on the burning questions of the day, which now appear even in semi-official papers like 'Novoe Vremia,' are of such character that, under the regime of von Plehve, the writer would have been furnished with a free ticket to the remotest and most desolate part of Siberia and the paper suppressed. More than this, Prince Sviatopolk Mirski has arranged a meeting at Saint Petersburg of the presidents of the Zemstvos of all provinces for the discussion of different subjects with the ultimate purpose in view of putting an end to the present awful state of things in Russia. All the presidents presented their views in a memorial which is submitted to the Czar. The main demands of the Zemstvos are: freedom of the press, speech and conscience; equality of every subject before the law and discontinuance of the arbitrary actions of the officials by making them responsible for their actions before the people. This meeting of the representatives is a thing unprecedented in the annals of the Russian history. It reminds somewhat of the calling of the notables in France in the reign of Louis XVI. Should the Czar refuse to grant the reforms asked by the Zemstvos—the course adopted by Louis XVI.—something startling will take place in Russia. It is rumored that Sviatopolk Mirski declared he would resign should the request of the Zemstvos be ignored.

The foreign policy of Russia since 1881 has been of prime importance in the field of European and Asiatic politics. Alexander III. was a lover of peace and during his lifetime he remained a power for peace on the continent. Affairs in Bulgaria where the Russian schemes were frustrated by the influence of Austria and Germany, threatened war for some time after 1885, but led to no hostilities. The formation of the Triple Alliance was followed by a rapprochement between Russia and France which began to take on a more formal aspect after 1891 and resulted in the conclusion of a defensive alliance. In Asia, however, Russia's policy has been one of constant aggression. Its hold on Turkestan had been firmly fixed by 1881 and

## RUSSIA

this was followed by the acquisition in 1884 of Merv, which brought the Russian power in close touch with the sphere of English influence in Afghanistan. In Persia, too, the Russian influence has been exerted toward gaining an outlet on the Asiatic waters. Conquest was consolidated by the building of railways of which the greatest is the Siberian railway planned to connect Saint Petersburg with the Pacific. The appearance of Japan as a factor in Asiatic affairs after her victory over China in 1894-5 aroused Russia to renewed efforts in the Far East. Through the intervention of Russia and Germany, Japan was deprived of its conquests in Manchuria, and in 1898 Russia by a lease from China secured possession for 25 years of the harbors of Port Arthur and Ta-lien-wan in the Liao-Tung peninsula, the very territory of which Japan had been forced to surrender possession. Port Arthur was very strongly fortified and the new port of Dalny built to take the place of Vladivostok as Russia's great ports on the Eastern seas, the last being ice bound during a considerable part of the year. The construction of the Manchurian railway connecting the newly acquired possessions with the main line of the Siberian railway was begun. During the Boxer uprising, of 1900 the Chinese attacked the Russian town of Blagoveshensk on the Amur River, in retaliation for which a Russian force invaded Manchuria, which, after sharp fighting, was overrun and occupied. By a convention between Russia and China, signed in April 1902, the former agreed to retire from Manchuria within 18 months. The sincerity of the Russian intentions, however, was open to doubt, the time was employed by them in increasing their forces in the country and strengthening the fortifications at Port Arthur and Dalny, and when the time for the evacuation of the country had arrived plausible reasons were brought forward for a continued occupation. At the same time Russia evinced a disposition to restrict the commercial rights of foreign nations in Manchuria. This aroused the jealousy of Japan, which deemed its paramount interests in Korea threatened by Russia's aggressive action. Negotiations between the two countries, relative to the situation in Korea and Manchuria, were begun in the fall of 1903 and were prolonged by repeated delays on the part of Russia, till the beginning of February 1904, when it became apparent that war was inevitable and that the purpose of Russia was probably to gain time for strengthening its position in Manchuria. In the first days of February Japan severed diplomatic relations with Russia and hostilities were begun on the night of 7-8 February. During the 18 months of war with Russia, the Japanese showed themselves to be the superior of the two, both on land and sea—on land defeating the Russians and compelling them to retreat as far north as Tie-Ling, and on sea by practically destroying the whole of the Russian fleet in the Eastern waters. The only resistance on the part of the Russian forces worth mentioning was the defense of Port Arthur, where the gallant General Stoessel (q.v.) won undying fame. The losses in men during these 18 months on both sides were enormous, in the battle of Liaoung alone where the number of combatants reached the

enormous figure of half a million, the losses in killed and wounded were counted to be over 100,000 men. The Russian government did not admit any other end of this war except complete victory for Russia, but the Japanese proved themselves superior to the Russians in every respect and, after decisively winning every important battle, concluded peace 5 Sept. 1905. See MANCHURIA; PORTSMOUTH, TREATY OF.

Meanwhile, the whole country was in a state of political ferment and almost anarchic disturbance. Strikes, mutinies, assassinations, mass meetings, demonstrations, and petitions asking for representative government, liberty of assembly, speech, and person, caused ceaseless agitation throughout the empire. The bureaucracy continued its policy of ruthless repression, imprisonment and exile, and man-peaceable demonstrations were turned into scenes of massacre, notably that in Saint Petersburg of 18 Jan. 1905, headed by Father Gapon (later, privately hanged for treachery, by his own party). In the provinces, at Moscow, Warsaw, Riga, Odessa, Reval, Lodz, Radom, and Kovno, disturbances broke out, the educated and professional classes joining with the industrial and agricultural masses in the demand for representative government. In the Caucasus a state of civil war existed between Armenians and Tartars. In Finland the diet refused to recognize the imperial decrees and the governor-general Bobrikoff and the procurator-general Johnson, were assassinated. On 17 Feb. 1905, at Moscow, the governor-general, Grand Duke Serge, uncle of the Czar, was killed by an anarchist's bomb. A manifesto issued by the Czar on 5 March again ignored the popular demand for a National Assembly, and a general strike of workmen was ordered throughout the country, whereupon a rescript promising a Legislative Assembly was published the same day. At Easter the Czar conferred religious freedom on over 52,000,000 subjects of many faiths, giving equal rights with the orthodox, to Old Believers, Jews, Catholics, Protestants, Buddhists, and Mohammedans. In May and July, congresses representing the zemstvos or elective provincial assemblies, and the municipalities, had assembled at Moscow, and prepared a draft constitution for presentation to the Czar, urging upon him the imminence of a revolution and the desirability that the promise of a constitution should be at once fulfilled. On 19 Aug. the Czar issued a manifesto creating an elective state council (Gosoudarstvennaya Duma), and regulations for elections to the Duma were submitted. On 25 Sept. a Zemstvo Congress was again held at Moscow, which criticized the National Duma to be convoked according to the law of 19 Aug. as not national representation in the correct sense of the word, and declared that representation should be on a national and not a class basis, the election of the representatives being by universal and direct suffrage. In October, the whole country was in a state of passive revolt; an organized strike on railways, gas and electric lighting plants, and other large industries, to enforce purely political demands, compelled the government to accede to the desired reforms. On 30 Oct. the Czar signed a constitution and appointed Count Witte as Prime Minister of a responsible ministry.

The law as promulgated grants the popula-

RUSSIA.

THE GREAT BELL, MOSCOW.

tion the firm foundations of civic liberty, based on the principles of inviolability of the person, and of freedom of conscience, speech, assembly and association, and established as an immutable rule, that no law shall come into effect without the approval of the Duma, and that to the elected of the people shall be guaranteed the possibility of a real participation in the control of the legality of the acts of such authorities as are appointed by the Czar. Provision is also made that the members of the Duma representing the governments or provinces and the greatest cities (Saint Petersburg, Moscow, and 26 others), shall hold office for five years, unless the Duma is dissolved by the Czar. The Duma may elect a President and Vice-President annually, and conduct its proceedings in general session and in sections. Ministers and chiefs of Departments cannot become members, but may attend the sessions. Members receive 10 roubles per day and traveling expenses. The election of deputies was indirect, and made by electoral bodies of the chief towns of governments or provinces and of the greatest cities, composed of delegates chosen by the district or town elective assemblies.

The Council of the Empire was reorganized and changes made in the constitution of the Duma under a manifesto and ukases published 6 March 1906. The Council of the Empire as now established, consists of an equal number of elected members and members nominated by the Czar, and is convoked and prorogued annually by Imperial ukase. The Council of the Empire and the Duma have equal legislative powers, and the same right of initiative in legislation and of addressing questions to Ministers. Every measure before being submitted for the Imperial sanction must be passed by both the Duma and the Council of the Empire, and all such as are rejected by one of the two legislative institutions will not be laid before the Czar. Both the Duma and the Council have the right to annul the election of any of their members. The elective members of the Council will be eligible for nine years, a third of the number being elected every three years. Each Assembly of the Zemstvo of each government or province will elect one member. Six members will be returned by the Synod of the Orthodox Church, six by the representatives of the Academy of Sciences and the Universities, 12 by the representatives of the chambers of commerce and industry, 18 by the representatives of the nobility, and 6 by the representatives of the landed proprietors, assembled in Congress at Warsaw. In the provinces of European Russia which have no Zemstvo, a Congress of the representatives of the landed proprietors assembled in the chief towns of their province to elect one member for each province to the Council of the Empire.

All members of the Council must have attained their fortieth year and possess an academic degree. The President and Vice-president are appointed by the Czar. The elective members of the Council receive an honorarium of 25 roubles (\$12.50) a day during the sessions. The sittings of both the Duma and the Council of the Empire are public. The closure of a debate may be voted by a simple majority. Neither the Council of the Empire nor the Duma is empowered to receive deputations or

petitions. Ministers are eligible for the Duma, and, in the capacity of elected members, are qualified to vote.

Laws voted by the two Houses are submitted for the Imperial sanction by the President of the Council of the Empire. The members of both institutions have the privilege of personal immunity during the session. They are only liable to arrest with the permission of the Duma or the Council of the Empire, according to circumstances, except in cases of flagrant offenses or offenses committed in the exercise of their duties. The ukases further provide that bills rejected by one of the legislative bodies cannot be brought forward again without the Imperial consent.

Zemstvo representatives, however, refused to support the Witte cabinet, and their action was endorsed by a Zemstvo congress assembled at Moscow. The Czar appointed Prince Goremykin to succeed Count Witte and the Russian Parliament was opened by the Czar, 10 May 1906, with gorgeous ceremony. The proceedings were marked by great distrust, which also characterized subsequent parliamentary proceedings, the strong opposition of the Court and bureaucratic party to all reform measures being confronted by the persistent tenacity of the national party. While universal suffrage was conceded, the Duma's solution of the agrarian problem was refused, and only a partial amnesty of political offenses granted. The policy of repression continued and the bureaucracy was openly charged with organizing and arming the baser elements of the nation, to incite them against the progressive elements of society, against intelligence, against students, workmen, and Jews. Instigated for reactionary purposes, it was alleged, pogroms or riots in which anti-Jewish outrages of the most horrible character were the chief features, were allowed to go unchecked by the authorities. The records of the massacres at Warsaw, Odessa, Kazan, Rostoff, Kherson, Kishineff, Kieff, Tiflis, Sevastopol excited universal reprobation, while the Bialystok massacre in June 1906 evoked a condemnatory message passed by the Congress of the United States.

On 22 July 1906 the Czar dissolved the Duma, placed Saint Petersburg under martial law, and appointed Peter Stolypin to succeed Goremykin as Premier. The Duma members, meeting at Viborg, Finland, issued a manifesto to the Russian people urging them to refuse to pay taxes, or send conscripts to the army until the power of Parliament be restored. Mutinies of the Cronstadt and Sveaborg (Finland) garrisons were quickly suppressed and the general strike of the Workmen's Councils, declared on 3 August, was called off on the 7th owing to non-support.

**Russian Literature.** In the compilation of works on the subject of Russian literature it has been usual to adopt the division of the same into different periods and to go back to early Russian history in search of monuments that may be used in supporting the opinion that Russian literature had its beginning in translations of certain Byzantine church works into old Slavonic, which was the exclusive church language. The heroic traditions, such as 'The Word of Igor's Band' or 'The Don River Slaughter' or the eloquent 'Letter of Vassian to Ioann III.' are cited in support of the assertions that these productions mark the origin of Russian literature. That such historical documents, folk lore and scholastic eloquence have no more relation to ours than the monuments of antediluvian literature, had such been discovered, have to the Sanskrit, Greek or Latin literatures, is too obvious to need a proof. Russian literature undoubtedly commenced in 1739 when Lomonosov, who earned the nickname of "father of Russian poetry and patriarch of Russian poets," sent from abroad his ode on the 'Capture of Khotin.' Therefore it would be a thankless task for anyone interested in the Russian literature to attempt to find anything approaching the definition of the word literature in all the documents which we possess from the so-called Byzantine Greek period down to the end of the period of Western European influence (1113-1698). There are many reasons for this, such as the Tartar invasion, which actually destroyed the Russian national life,

but mainly the despotic form of government which obtained in Russia from the time of the Tartar domination down to our own times, and the influence of the orthodox church which, as a supporter of the despotic government, was always opposed to the free egress of human thought. It is a notorious fact that printing was introduced in Russia about 100 years after its discovery. The history of the Russian censorship is one of the blackest pages in the history of the Russian people, and the assertion of a gifted contemporary writer, Menchikov, that we hardly have any national literature, does not seem to be paradoxical in the least to the persons acquainted with the Russian censorship. The writers who speak of the revival of literature in the sixteenth century and cite as an example the correspondence between Ivan the Terrible and Prince Kurbski have very poor conception of the word literature, because the letters which passed between the insane despot and one of his subjects, who ran away from his insane fury, and found a refuge in Lithuania, should no more be considered literary documents of a country than scribbles of a cannibal king inviting his victims to get cooked. Even Kurbski in his answers to the Czar accuses the latter of being a bad grammarian and fully devoid of knowledge of the proper use of words and expressions. No doubt Peter the Great was instrumental in advancing the progress of the Russian thought and his reign was the precursor of the birth of Russian literature, but the names of early workers in this field are few and far between and, with the exception of Lomonosov and probably Karamzin, cannot be placed among the writers of note. Yet we are accustomed to hear among the names of poets of this epoch that of Trediakovski (1703-68), who at the best was a poor rhymester, whose writings, as our immortal Belinski said, remind us of the senseless dream talk of a sick man. Even what to a certain degree was considered poetical talent in Derjavin (1743-1816) at his epoch, now, in a contemporary writer, we would call prose and a lack of genius. And Derjavin was considered a poet of high attainments, who perfected lyric poetry. We may mention the names of other writers of this epoch such as Sumarokov (1718-77) who imitated, and badly at that, the theatrical plays of Corneille, Racine, and Molière; Fonvisin (1744-92), who is considered to be a satirical writer, but whose satires produce rather the feeling of pity and regret than laughter; Kniaznin (1742-91); Novikov (1744-1818), all of these are not above mediocrity; besides Lomonosov only one other name deserving notice is that of Karamzin (1766-1826) who in his 'History of Russia' gave us the first readable and connected story of our historical past. Generally speaking the Russian literature of the eighteenth century and up to the present time has been and continues to be an imitative one. There is marked absence of originality, though commencing with Pushkin our poetry is original. The writers of the reigns of Anna Ioannovna, Elizaveta Petrovna, and Catherine II are noted for their obsequious, servile style, which is explained by their having been almost wholly dependent upon the bounty and mercy of the reigning heads. Catherine II. encouraged literature, being herself somewhat of a writer, whose productions, however, beyond the fact that they

came from under the pen of a crowned head, do not represent anything of ability or talent. She was acquainted with the encyclopedists, corresponded with Voltaire and even invited Diderot to St. Petersburg, yet it seems that she acquired but a superficial idea of the teachings of encyclopedists, for, when Radisthev (1769-1802), author of the celebrated 'Voyage from St. Petersburg to Moscow,' depicted in this book the terrible state of serfs under the tyranny of their owners and concluded by the almost identical words of Robbie Burns that 'man's inhumanity to man makes countless thousands mourn,' she declared him to be a rebel and instigator against the authorities and banished him to Siberia. And to this Radisthev the Russian literature owes more than to any other writer, on account of his having been the first to give the real basis to the philanthropic tendency pervading Russian literature through the whole of the nineteenth century. Later on Turgenyev, Belinski, Herzen, and Count Tolstoi continued to carry high the banner of Radisthev. We should not pass unnoticed the name of Jukovski (1793-1852), who, though he did not leave to posterity anything original worthy of note, was one of the best translators of foreign literature, whose poetical translations, thanks to the richness and flexibility of the Russian language, are wonderfully close to the original in German, French, and English, both in the measure and correctness of the translation. He was the first to avoid the use in writing of stiff and affected Russian words and expressions, and to introduce language which is freer and closer to the colloquial form. In Alexander Pushkin (1799-1837) the Russian poetry had first true representative of humanitarian principles; he was the first Russian poet who did not imitate and who was conspicuous for originality of his writings. Of his poems the best known are: 'Ruslan and Ludmila,' 'The Prisoner of Caucasus,' 'Bakhtchisarai Fountain,' 'Robber Brothers,' 'Gypsies,' 'Poltava,' and 'Evgeni Onegin'; of his prose writings 'The Arab of Peter the Great,' 'Captain's Daughter,' and 'Dubrovski' are the most popular. As a writer of epigram he had no equal. Among his contemporaries we may mention Batiushkov, Baratynski, Delvig, and especially Koltzoff, who were his followers in the field of poetry. Koltzoff (1808-42) is best known by his idylls from peasants' life, which contain so much tenderness, so much faith in the patient force of labor that one wonders that such idylls could have been written during the worst time of serfdom. Kryloff (1768-1844) is famous as a fable writer, and Gribjedov (1794-1809), whose comedy-satire 'Grief from Mind,' written in verse, and giving real pictures of life of high society in the beginning of the nineteenth century, will not be forgotten as long as the Russian language exists. Lermontov (1814-41) is another star among the Russian poets; the best of his poems are 'Demon,' 'Mtsyri,' 'Ismail-Bey'; he also wrote a short novelette, 'The Hero of Our Own Time,' which is very popular. It is a noteworthy fact in the history of the Russian literature that but few of its most talented representatives escaped the persecution of the government. Many of them had to pass long periods in prison or exile. One of the most glaring instances of such persecution is that of Potejaev (1805-38), who, had he been

## RUSSIAN LITERATURE

spared to literature, would have been placed by posterity among our greatest poets. The whim of Nicholas I sent the unfortunate man to a regiment in the Caucasus, to serve as a soldier, for a trivial offense, if it can be called an offense, of writing a poem 'Sashka,' which, though not very savory, was extremely well written. The intercession of many influential people did not procure his return from the exile where, not being able to endure the rigor of the military discipline, he died of consumption. The reign of Nicholas I, despotic as it was, can boast of several noted writers of whom Gogol (1809-52) is the most remarkable. His prose-poem 'The Dead Souls' gave a complete picture of the officialdom, of traits and manners of persons of every class in Russia in the first quarter of last century. His historical novel 'Taras Bulba' is the most successful novel ever written in Russian; his comedy 'Revisor' is considered a masterpiece of that class of literature. He would have been the most idolized writer in Russia had he not published his 'Selections from the Correspondence with Friends,' which at once destroyed the pedestal upon which he stood so high in the eyes of all intelligent Russians; the only good effect of this publication was that it produced the now famous letter of our immortal Belinski (1811-48) to Gogol. After Nicolai Polevoy (1796-1846), who was a pioneer of the critical literature of Russia, Belinski occupies the foremost place as the most gifted, fearless, and elegant critic Russia ever produced. His followers in this branch of literature were Dobroliubov (1836-61) and Pisarev (1841-68), and later on Michailovski, all of whom were very popular. The last years of reign of Nicholas I form the most sombre period in the history of Russian literature. The oppression of the censorship was distressing, and though Russian literature did not succumb, it had a hard struggle for existence. And probably this struggle developed quite a number of talented writers. Foremost among them are Count Leo Tolstoi, Turgenev (1818-83), and Dostoevski (1822-81). Count Tolstoi's name is known throughout the world as that of a philosopher, philanthropist, writer, and champion of freedom, both religious and political, for the Russian people. His writings are very numerous, and it is hard to select from them one in which his genius appears at its best. Of his early writings 'War and Peace,' 'Anna Karenina,' and those of recent time 'Kreutzer's Sonata,' 'The Power of Darkness,' and 'Resurrection' are fair exponents of his genius. Of Turgenev's writings the best are 'Memoirs of a Hunter,' written when he was only 27 years of age, 'Fathers and Sons,' 'Virgin Soil,' Dostoevski's 'Memoirs from the Dead House,' 'Crime and Punishment,' 'Idiot,' and 'Humiliated and Abused' breathe with a profound love for all the oppressed, despoiled, and humiliated. Goncharov (1812-91) is mainly known by his admirable novel 'Oblomov,' in which he very artistically brought together all the repulsive traits of a landowner, brought up in the demoralizing atmosphere of serfdom, with the best and most attractive sides of a real Russian. Gribovitch (1820-99) and Pisemski (1820-82), both of whom occupy honorable place in the literature, the former by his 'Anton Goramyka,' and the latter by his novel 'Thousand Souls'

and a realistic drama 'Sad Fate,' the most successful drama ever produced on the Russian stage. Another dramatist and playwright, Ostrovski (1823-86), presented to the public the unattractive character of the Russian merchant in all its nakedness. The best known of his plays are 'The Storm,' 'Poverty is no Vice,' and historical drama 'Vasilisa Melentieva.' The name of Alexander Herzen, a writer who did more than any other man in Russia for the liberation of the serfs, is now given an honorable place in the literature, though some 50 years ago, when he was editor of 'The Bell,' a Russian paper published in London, a letter from him, discovered by the police, was sufficient to have a man deported to Siberia. The most beloved poet of the epoch of great reforms, whose genuine poetry discloses such profound sympathy and love for the people, was Nekrasov (1821-77). Other poets who sang the sorrow of the peasant class were Nikitin (1824-61), Plestsheev (1825-93), Kurochkin (1831-73), the latter, however, is better known as excellent translator of the songs of Béranger from the French. The Crimean war, exactly like the Russo-Japanese campaign, revealed a great mass of abuses in every department of the government, and produced the feeling of instability of the whole administrative organism. This feeling found vent in the peculiar expository literature which sprung up on the eve of great reforms, and which denounced the bribe-takers and government thieves in prose and poems, in small stories and in large novels. The most talented among such writers was undoubtedly Michail E. Saltykov (1826-89). His early 'Provincial Sketches' at once placed him in the front rank of Russian literary men. To the end of his days Saltykov continued to denounce the corruption and abuses of the Russian bureaucracy, which did not fail to bring down on him the wrath of the government. His 'Well Meaning Discourses,' 'Messieurs Golovlevs,' 'Pompadours, Male and Female,' and 'Memoirs of a Provincial in St. Petersburg' are the best of his voluminous works. Around Saltykov we see other young writers of the same tendencies, such as Pomalovsky (1835-63), Reshetnikov (1841-71), whose novel 'Podlipovtzy' is often quoted, Levitov (1842-77), and inimitable Gleb Uspensky (1840 or 1843, died a few years ago). Our poets of the second part of the nineteenth century were, so to speak, brought up upon the poetry of Pushkin and Lermontov, but their poetry is much nearer to the reality. Of them deserving note are Maikov (1821-97), Polonsky (1819-98), Shenshin (pseud Fet) (1820-92), Tutchet (1803-73), May (1822-62) and Count Alexis Tolstoi, the latter besides his many songs and poems, wrote a remarkable historical novel, 'Prince Serebrianniy,' and three trilogies, 'Death of Ivan the Terrible,' 'Czar Feodor Ioannovitch,' and 'Czar Boris.' The epoch of great reforms produced the division of our fiction writers into two classes: conservative and liberal. To the former, who, disappointed in the liberal movement and its leaders and influenced by the Polish insurrection, commenced a crusade against the liberal movement, belong Leikov, Kliushnikov, Markevitch, and Krestovski, whose writings, not even always talented, have the stamp of having come out from a detective bureau, because they excited suspicion

In treason and contained libels even against persons occupying high official positions, accusing them of being nihilists and anarchists. To the liberal class belong Terpigorev (1841-95), Garshin (1855-88), whose untimely death deprived Russian literature of one of the most talented writers. Another name which occupies an honorary place in Russian literature is that of Nicolai Tchernyshevski (1828-1903), who is best known by his novel 'What is to be Done,' which at the time produced quite a sensation among the young Russia, being a sermon of communism, though it did not disclose anything new to the readers of Eugene Sue's novels, containing similar Utopias. He wrote a good deal on politico-economical questions, but these articles lost all their interest and grew old; and his notes on Mill's 'Political Economy,' which represent the system of Louis Blanc, will also appear childish from the point of view of modern socialism. Among the contemporary writers there is quite a number of talented followers of the humanitarian school, men who represent the best element of the Russian intelligent society. Of the writers of fiction Albov, Zaso-dimski, Ertel, Korolenko, Zlatovratski, Maria Krestovskaja, Mamin-Sibirski, Salov, and Lugovoi are the most popular and the most sympathetic. The most talented writer, who is called Russian Maupassant, Anton Tchekhov, died on 15 July 1904. His best works are 'My Life' and 'Peasants.' The names of Maxim Gorki and Leonid Andreev are those the most quoted at the present time. Maxim Gorki, undoubtedly a talented writer, uses his talent in depicting the life of the dregs of human society, vagrants, thieves, and inhabitants of the dens of vice and, strange to say, has the tendency to idealize his heroes. The most powerful of his novels is 'Foma Gordeev,' the only one which probably will survive him. As to Leonid Andreev, his popularity is purely the result of the unbounded — sickening at times — naturalism of his stories. Of contemporary poets the following are of note: Nadson (1862-87), a very talented poet, yet his poetry is too pessimistic to please all. Jemchujnikov, Korinsky, Slutchevski, and especially Miss Schepkina-Kupernik. One of the grand dukes, Konstantin Konstantinovich, who writes under the pseudonym 'K. R.' is a poet of no mean degree. Among the followers of decadent school of poets are Merejkovski, Belmont, and Minski, but their poems, like those of Frug and Fofanov, serve mostly as subjects for comical reviews by our well known critic Burenin. Of the dramatists the best known are Potekhin, Krylov, and Shpajinski. Consult: Belinski, 'Russian Literature'; Polevoy, 'History of Russian Literature'; Sementkovski, 'Russian Literature on the Eve of the Twentieth Century'; Soloviev, 'Literary Movement of the Nineteenth Century in Russia.'

V. P. POLEVY,  
*En-Officer of the Russian Artillery.*

**Russian Thistle**, a naturalized annual (*Salsola tragus*) (one of the *Chenopodiaceae*), becoming a dreaded pest in the northern and western United States. It is closely related to, and resembles, the prickly salt wort of the sea-beaches and in no way, except spininess can be confounded with the true thistles. It is a glabrous, succulent, spreading bushy herb, with slender branches and small linear leaves, tipped

by a prickly, and usually bright red at maturity. Its small flowers are single in the axils, and are succeeded by hard little fruits surrounded by broad, five-parted horizontal wing of the calyx, which is conspicuously veined. Like many desert plants, at maturity, and in the dry season, its branches contract into a ball, enclosing its capsules full of ripe seeds, and it becomes a "tumble-weed," blown across the country by the wind, and scattering its seeds, to take root in favorable soils. Careful cultivation is the best way to exterminate the Russian thistle.

**Russ'niaks.** See RUTHENIANS.

**Rust**, peroxide of iron, formed by the gradual oxidation of iron when exposed to the air. To remove rust the usual mode is to rub the object with a piece of oiled rag or emery paper. More rapid and more satisfactory results are secured by using very pure petroleum, and wiping with a hempen or woollen rag. To prevent rust, dip iron or steel articles in a mixture of equal parts of carbolic acid and olive-oil, rubbing the surface with a rag. Others rub the metal with a mercurial ointment, leaving a thin layer over the entire surface. If iron be dipped in a solution of carbonate of potash or soda in water the surface will be protected against rust for a long time, and objects can be protected for any period by burying in quicklime. Rubbing the surface with plumbago has a similar effect.

**Rustchuk**, roos-chook', Bulgaria, a town on the right bank of the Danube, at the confluence of the Lom, opposite Giurgevo, 42 miles southwest of Bucharest. It has some woollen, silk, and other manufactures, and considerable trade. It is of strategic importance owing to its position on the Turkish frontier, and was almost destroyed by the Russian bombardment in the war of 1877-8.

**Rusta.** See FUNGI.

**Rutaba'ga.** See TURNIP.

**Rutaceae**, roo-tá'sé-é, a widely dispersed order of polypetalous plants with about 880 species, most frequent in warm regions, and especially so in South Africa and Australia. They are generally shrubs or trees, bearing leaves in various forms, without stipules, dotted with glands and often heavy-scented. The four- or five-merous flowers are often in axillary cymes, and the fruits are various, being most conspicuous in the genus *Citrus*, which produces the orange and lemon. Two American genera are the *Ptelea* (hop-tree), and the *Xanthoxylum*, or prickly ashes. The latter is represented by small trees, prickly, with a powerfully stimulative and tonic bark. The common rue is a member of the typical genus *Ruta*.

**Rutgers**, rút'gérz, Henry, American philanthropist: b. New York 7 Oct. 1745; d. there 17 Feb. 1830. He was graduated from Columbia in 1766; served as captain and later as colonel of New York militia in the Revolutionary War, and entered the legislature in 1784 to which he was frequently re-elected. He was a member of the board of regents of New York University from 1802 to 1826. His gifts to public purposes were many, the chief being \$5,000 to Queen's

## RUTGERS COLLEGE—RUTHENIUM

College of New Jersey, which thereupon took the name of Rutgers.

Rutgers College, located at New Brunswick, N. J. It was chartered in 1766 under the name of Queen's College, and the charter slightly altered in 1770. In 1771 the college was located at New Brunswick; during the Revolutionary War, when the British army occupied New Brunswick, the college exercises were continued at Millstone and at North Branch. The present site of the college was secured in 1808, and in 1829 a generous donation was received from Col. Henry Rutgers, and the name changed to Rutgers College in his honor. A theological school was at first affiliated with the college, but has since become an independent institution. There is a preparatory school established at the same time with the college. The organization of the collegiate department now includes two schools, the classical school and the Rutgers Scientific School. In 1864, the Legislature designated "The trustees of Rutgers College in New Jersey maintaining the Rutgers Scientific School" as the State College of Agriculture and Mechanic Arts; the Scientific School thus became the beneficiary of the Congressional land grant of 1862, and of the appropriation law of 1890. In the classical school the work of the freshman and sophomore years is required, two courses are elective for junior and senior years; the degrees of A.B. and B.L. are conferred. In the Scientific School the studies of the freshman year are the same for all courses, at the end of that year the student elects one of the six courses offered, certain subjects, such as English, history, political economy, etc., being required in all. The six courses are agriculture, civil engineering, and mechanics, chemistry, electricity, biology, clay-working and ceramics. All courses lead to the degree of B.S. There is also a special two years' course in ceramics. Military drill is required of all students in the Scientific School. The school conducts a university extension department, and the State agricultural experiment station is connected with it. The Scientific School is under control of the college board of trustees of which the governor, the chief justice, and the attorney-general are members *ex officio*; and is also under the supervision of a State board of visitors appointed by the governor. The college farm contains 200 acres and is well equipped with modern apparatus. The buildings on the campus include Queen's College, Fine Arts Building, Van Nest Hall, Geological Hall, Kirkpatrick Chapel and Library, State Laboratory, Ceramics Building, Winants Hall (dormitory) and the Ballantine Gymnasium. The library in 1910 contained 62,000 volumes; the students in the collegiate department numbered 420 and the faculty 46.

Rutgers Scientific School, a department of Rutgers College, New Brunswick, N. J., designated by law as the New Jersey State College of Agriculture and Mechanic Arts. See **RUTGERS COLLEGE**.

Ruth, Book of, a canonical book of the Old Testament, containing four chapters. The date of the little history contained in this book cannot be precisely fixed. Who the writer of the book was is also unknown. Some have ascribed it to Samuel; others have placed it as

late as the Babylonian captivity; whilst several of the best modern scholars regard it as post-exilic. On the one hand, the style of the narrative connects it with the period when the Hebrew language and literature were still in full vigor and freshness, not with the period of their decay. On the other hand, it is evident that it cannot be placed earlier than the time of the kings, first, from the way in which the judges are mentioned in chap. i.; secondly, from the change in the customs of the people that must have taken place between the date of the events and that of the narrative that records them (chap. iv. 7); and thirdly, from the mention of the name of David. In the Hebrew Bible the Book of Ruth now stands among the Hagiographa immediately after the Song of Solomon as one of the five Megilloth, or sacred rolls, read on occasion of the principal Jewish solemnities. But there can be no doubt that originally in the Hebrew Scriptures, as in the Septuagint and in the English Bible, it followed the Book of Judges, and was sometimes even reckoned part of it.

The story told in the Book of Ruth is a charming epic, relating the love of Ruth, a young widow of the tribe of Moabites, for Naomi, the mother of her dead husband. Ruth and her mother-in-law were very poor, and Ruth gleaned in the fields of Boaz, a rich husbandman of Bethel. Boaz, upon noticing the lovely Jewess, directed his harvesters to leave a generous supply of grain on the ground, thus enabling Ruth to glean a plenty. Subsequently Ruth married Boaz; she was the great-grandmother of David. Consult "Popular Introduction to the Book of Ruth," by R. W. Bush (London, 1885).

Ruthenians, Rusaniaks, or Red Russians, are the Slavonic tribes inhabiting eastern Galicia, Bukovina, and northeastern Hungary. The number of Ruthenians in the Austrian Empire amounts to 3,000,000, of whom about 500,000 are settled in Hungary. Very few can read or write. Their dwellings are wretched huts of boards and mud. Superstition is very rife. In the popular songs, which have a close connection with those of the other Slavonic nations, there is a prevalent strain of sadness both in the words and in the melodies. The occupations of the people are pasturage, agriculture, and carrying (by means of conveyances drawn by animals). Of manufacturing industry there is no trace. The towns are inhabited by Poles and Jews; the nobility are Polonized. The Ruthenians belong for the most part to the United Greek Church, and pay a blind obedience to their clergy. They are bitterly hostile to the Poles, and latterly their efforts have been directed to the separation of Galicia into a Polish kingdom in the west and a Ruthenian in the east. They have likewise begun to attach themselves in their literature to Russia, allowing the Ruthenian dialect to drop out of existence as a literary tongue.

Ruthenium, a metal of the platinum group. It has the atomic weight 101.7, and the symbol Ru. Some specimens of platinum ore contain from 3 to 6 per cent of ruthenium. It is a whitish-gray metal, having a specific gravity of 11 to 11.4; is very infusible, more so than any other metal except osmium; is

## RUTHERFORD — RUTLEDGE

searcely attacked by nitromuriatic acid, but is more easily oxidized by fusion with nitre, chlorate of potassium, etc., than platinum. Ruthenium forms a series of salts which are analogous to those of platinum.

**Rutherford, N. J.**, borough in Bergen County; on the Erie railroad; about nine miles from New York, seven miles southeast of Paterson, and eight miles north of Jersey City. It is a residential place, occupied chiefly by business men from New York. Several electric lines connect the borough with many of the cities and boroughs in the vicinity. Its principal public buildings are churches, schools, and a public library. Pop. (1910) 7,045.

**Rutherford, Ernest**, Canadian physicist: b. Nelson, New Zealand, in 1871. He was educated at Nelson College and the University of New Zealand, and at Trinity College, Cambridge, England. He was awarded the 1891 Exhibition Science Scholarship in 1895 and from that time until 1898 worked at research in the Cavendish Laboratory, Cambridge, in the latter year being appointed professor of physics in McGill University, Montreal. In 1903 he was elected a Fellow of the Royal Society; in 1904 delivered the Bakerian lecture before the Royal Society and was awarded the Rumford Medal; in 1905 delivered the Silliman lectures at Yale University. Since 1907 he has been director of the physical laboratories of Manchester University, England. In 1908 he was awarded the Nobel prize for chemistry. He has published 'Radioactivity' (Cambridge University Press 1904).

**Rutherford, rŭth'ér-fér'd, Lewis Morris**, American astronomer: b. Morrisania, N. Y., 25 Nov. 1816, d. Tranquility, N. J., 30 May 1892. He was graduated from Williams College in 1834, admitted to the bar in 1837, and practised law in New York until 1849. He then devoted himself to the study of science, making valuable investigations in the departments of astronomical photography and spectral analysis. He made several instruments for use in his laboratory, among which were an object glass, a micrometer for measuring astronomical photographs and a dividing engine (q.v.) of great value. He was a trustee of Columbia University from 1858-84, when he resigned and presented his astronomical instruments to that institution where they are now mounted, and was also one of the original members of the Academy of Science.

**Ruthven, rŭth'ven** (Scotch, rŭv'én), **Raid** of, one of the strangest conspiracies in British history, and even as yet unexplained, in which an attempt was made on the life of James VI., then king of Scotland, and afterward, as James I., king of England, after being decoyed to Gowrie House, at Perth, in the month of August, 1600, by Alexander Ruthven, brother of the Earl of Gowrie. See **GOWRIE CONSPIRACY**.

**Rutland, Vt.**, city, county-seat of Rutland County; on the Otter and East creeks, and on the Rutland, B. & R., and the Delaware & H. R.R.'s; about 56 miles south-southwest of Montpelier, the State capital, and about 62 miles south by east of Burlington. It was settled in 1770 by persons from the East and was incorporated in 1761, by New Hampshire. It was chartered as a city in 1892. Rutland was

in the battle region of the War of the Revolution. Two forts were erected here, as it was situated on the Great Northern Military Road. In 1781 it was made the capital of the county, and from 1784 to 1804 it was one of the State capitals. The old boundaries included an area of 26,000 acres with the Green Mountains on the east and the Taconic Range on the west. In 1886 the towns of Proctor and West Rutland were set off from Rutland. The area of the city (1903) is 8¼ square miles. The new towns have independent governments, but all are united commercially. Rutland is in an agricultural region, but is well-known for its extensive marble quarries and industries connected with the shipment of marble. Iron ore, fire-clay, and slate are found in the vicinity. The marble works have been of considerable importance since 1830. The quarries are now in the new towns, but the industries continue as formerly. The chief industrial establishments of Rutland are manufacturing in which are made machinery for quarrying, and channeling marble, machine shops, engine and boiler works, Howe's scale factory, sash, door, and blind factories, butter and cheese factory machinery, lumber and brick yards, sugar evaporator works, creameries, and flour and grist mills. The government census of 1900 gives the number of manufacturing establishments 63; the amount of capital invested, \$2,650,000; number of wage-earners in manufacturing, 1,810; annual amount of wages, \$924,000; value of product, \$2,680,000. The principal buildings are Memorial Hall, built in honor of the soldiers of Rutland who fell in the Civil War, Baxter Memorial Hall, the government building, the county court-house, city-hall, house of correction, opera house, bank buildings, churches, and schools. The material for the construction of Memorial Hall was donated by the marble quarry companies and the cost additional was \$60,000. The educational institutions are a high school, Saint Joseph's Academy, public and parish graded schools, the Rutland Free Library, and Baxter Memorial Library. The city is well equipped with banks, newspapers, and wholesale and retail business establishments. Pop. (1890) Rutland 11,760; West Rutland, 3,680; Proctor, 1,758; total, 17,198; Rutland (1900) 11,499; (1910) 13,536. Consult: Hemmingway, 'Gazetteer of Vermont'; Moore, 'Churches of Rutland, Vermont.'

**Rutledge, rŭt'lĕj, Edward**, American soldier and legislator: b. Charleston, S. C., 23 Nov. 1749; d. there 23 Jan. 1800. He was admitted to the bar in 1773, established a practice in Charleston and in 1774 was elected to the Continental Congress. He was a signer of the Declaration of Independence in 1776 and a member of the first board of war. In this capacity he was delegated with John Adams and Benjamin Franklin to confer with Lord Howe on the subject of a reconciliation, but declined to treat with him excepting on the basis of American independence. As lieutenant-colonel of the Charleston artillery he assisted in expelling the British from Fort Royal in 1779 and in 1780 was captured. After his release a year later he resided in Philadelphia, was a member of the Jacksonborough legislature in 1782, and after the war returned to Charleston where he resumed his law practice. He was for many years

a member of the State legislature, was elected United States Senator in 1794, and governor of South Carolina in 1798. Consult McCrady, 'South Carolina in the Revolution' (1901-2).

**Rutledge, John**, American jurist; brother of Edward Rutledge (q.v.): b. Charleston, S. C., 1739; d. there 23 July 1800. He studied law in England, returned to Charleston in 1761, and there established himself in law practice. From the outset of his career he was an ardent opponent of the oppressive laws governing the colonies and as delegate to the congress at New York in 1765 openly advocated the united resistance of the colonies. In 1774 he was a member of the South Carolina convention which carried a resolution that South Carolina should be represented in the Continental Congress. He served as delegate to the Congress of 1775 and in 1776 was chairman of the committee that framed the South Carolina constitution, was elected president of the State government and commander-in-chief of the militia. When the British forces arrived off Cape Fear he fortified Charleston and prevented the invasion of the State. He resigned his office in 1778 through dissatisfaction with changes in the constitution, but was recalled in the following year and invested with dictatorial authority. He at once set about preparations for defense and held the city until 1780. He then joined the forces of General Greene and upon the recapture of Charleston resumed his duties as governor. In 1782 he was elected to the Continental Congress, was re-elected in 1783 and in 1784 became chancellor of South Carolina. He was a member of the convention which framed the Constitution of the United States in 1787. He became chief justice of his State in 1791, and in 1795 was appointed chief justice of the Supreme Court. His mind failed in the following year and he held no further public office.

**Ruwenzori**, roo-wên-zô-rê, a group of mountains in Africa, north of the equator, discovered by Stanley in 1888, in his great journey from the west to the east coast, when he brought Emin Pasha away with him. It appears to be a chain of heights about 16,000 feet in elevation, and is clad with snow and traversed by large glaciers. It lies about 200 miles to the westward of the Victoria Nyanza, and between the Albert Nyanza and Albert Edward Nyanza. The river Semliki, which connects the two lakes, flows in a valley near the range. The snow-line is about 13,000 feet above sea-level. These mountains are sometimes identified with the Mountains of the Moon, spoken of by ancient writers.

**Ruysbroeck**, rois'brêk, or **Rusbroek**, roos'brôk, Jean de, Dutch mystic: b. Ruysbroeck 1293; d. Grönendal 1381. He was educated at Brussels and for 26 years was vicar of the church of St. Gudula there. In 1353 he renounced the secular priesthood and entered the Augustinian monastery of Grönendal, in the forest of Soigny, where he became prior, lived a contemplative life and wrote his mystical works. His four principal works are 'Die Zierde der geistlichen Hochzeit'; 'Der Spiegel der Seligkeit'; 'Von dem funkelnden Stein'; and 'Samuel.' They were originally written in Dutch and are regarded by his countrymen as

among the best prose of the Netherlands during the Middle Ages. Translations were made into German, French and Latin. The four works cited were edited by Arnswaldt (1848); no collected edition has been made embracing his other works, which however, are mainly restatements of the main features of the foregoing. Consult: Engelhardt, 'Richard von S. Victor und Johann Ruysbroek' (1838); Ullmann, 'Reformatoren vor der Reformation.'

**Ruysbroek, Willem van** (GUILLAUME DE RUUSBUQUIS), Franciscan friar and traveler: b. Brabant about 1215; d. some time after 1293. He was sent by Louis IX. of France to Central Asia to bring about an alliance with Sartach, a supposed Christian prince of Kiptchak, then at war with the Saracens. In May 1253 he set out from Constantinople upon his mission with two other Franciscan friars and an interpreter; crossed the steppe, now a part of the Russian province of Ekaterinoslav, reached the banks of the Don, and, after many hardships, the camp of Sartach near the Volga. Refused permission to preach Christianity in Tartary, he made his way across the Caucasus into Armenia, Persia and Asia Minor, reaching Tripoli in Syria in August 1255. An account of the countries and peoples visited by these missionaries was written by Ruysbroek and sent to the French king. The best modern translation is that of Michel and Wright in Vol. IV of 'Recueil de Voyages et Mémoires de la Société de Géographie' (1839).

**Ruydael, Jacob van**. See **RUISDAEL**.

**Ruyter, rî'ter** (Dutch, roi'ter), **Michaël Adriaanszoon de**, Dutch admiral: b. Flushing 24 March 1607; d. Syracuse, Italy, 29 April 1676. He early entered the navy and rose from cabin-boy to captain (in 1635). In 1641 he was placed as rear-admiral in command of a fleet sent to the assistance of the Portuguese, who had thrown off the yoke of Spain, and he was afterward employed against the Barbary corsairs. In the war between the Dutch and English, which commenced in 1652, Ruyter repeatedly distinguished himself, especially in the battle fought in February 1653, near the mouth of the Channel, in which Blake, commanding the English, defeated Tromp and Ruyter, who commanded the Dutch. He became vice-admiral of Holland after the death of Tromp in 1653 and afterward served against the Portuguese, the Swedes, and the Algerines. He commanded in the great battle fought in the Downs in June 1666, against Prince Rupert and the Duke of Albemarle, and in the following year made his memorable expedition up the Thames, when he destroyed Upnor Castle and burned some ships at Sheerness. He was made admiral-in-chief of the Dutch fleet and commanded at the battle of Solebay (Southwold Bay) in 1672, when the Dutch were defeated by the English under the Duke of York; but in the following year gained a victory over the combined English and French fleets. Consult 'Life' by Milne (1897).

**Ryan, rî'an**, **Abram Joseph**, American poet and Roman Catholic clergyman: b. Norfolk, Va., 15 Aug. 1839; d. Louisville, Ky., 23 April 1886. He became a chaplain in the Confederate army shortly after his ordination to the priesthood, and served until the close of the war, afterward engaging in clerical labors in New Or-

leaus, where he edited the 'Star.' He subsequently removed to Knoxville, Tenn., and thence to Augusta, Ga., where he established the 'Banner of the South.' He was later in charge of a parish in Mobile, Ala., but in 1880 went North where he engaged in lecturing and also supervised the publication of his poems, subsequently returning to the South. His works include 'The Conquered Banner and other Poems' (1880); 'Poems' (1880); etc.

**Ryan, Edward George**, Chief Justice for more than six years of the Supreme Court of the State of Wisconsin: b. Newcastle House, near the village of Enfield, County Meath, Ireland, 13 Nov. 1810. His father, Edward, was a younger son of the family of Ryan, of Ballinakill; his mother, Abby, was the eldest daughter of John Keogh, chairman of the Catholic Committee of Mount Jerome. By means of an annuity, obtained from this Keogh, the ten children of Edward and Abby received an excellent education. Edward George was sent to Clongowes Wood College, where he remained from 1830 until 1837. He was always destined for the law and was nominally engaged in its pursuit in 1838 and 1839. Obtaining his father's consent, he removed to New York city in 1839, where he studied law, supporting himself by teaching. Admitted to practice in 1836, he removed in the same year to Chicago, Ill. In 1839 he became the editor, in that city, of a newspaper called the *Tribune*, Democratic in politics and closing its career in 1841. During a portion of this editorial period he was prosecuting attorney of Cook County. Mr. Ryan's health being poor in Chicago, he removed in 1842 to Racine, Wis., and in December 1848 to Milwaukee in the same State. While residing in Racine he was in 1846 a delegate to a convention at Madison, the capital of the then territory, which met to frame a State constitution. As chairman of the committee on banks and banking, and member of the committees on the judiciary and on education he wielded great influence in the deliberations of the convention. While the constitution which this convention framed was repudiated by the people, yet the reputation of Mr. Ryan as a lawyer and a publicist was established.

As a practitioner in Milwaukee he achieved great renown, especially in criminal causes. His most conspicuous effort was in 1853, when he was employed to assist the managers of the Assembly of Wisconsin in its impeachment before the State Senate of Levi Hubbell, Judge of the Second Judicial Circuit. This trial ran through many weeks and was characterized on Mr. Ryan's part by the most skilful treatment of witness and by the most powerful invective in denunciation of the defendant.

Although a Democrat of the States rights school, Mr. Ryan was always loyal to the Government of the United States. The 'Ryan Address' issued by him in 1862 did much to uphold the hands of the Government in its struggle for existence.

On the 7th of June, 1874, Mr. Ryan stepped from active practice at the bar to the position of Chief Justice of the Supreme Court. This was by executive appointment. In April, 1875, he was elected by the people to the same office for a term to expire in January, 1882. He did

not survive to finish this term. He died in Madison on 19 Oct. 1880.

WILLIAM W. WHEAT.

**Ryan, James**, American Roman Catholic bishop: b. Thurles, County Tipperary, Ireland, 1848. He came to the United States when a child, studied for the priesthood at the seminaries of Saint Thomas and Saint Joseph, Bardstown, Ky., was professor at Saint Joseph's and after ordination served on the Kentucky mission for seven years. In 1876 he was appointed to a charge at Wataga, Ill., and afterward was for a time at Danville. He was rector of Ottawa from 1881-8, when he was consecrated bishop of Alton.

**Ryan, Patrick John**, American Roman Catholic prelate: b. Cloneyharp, Ireland, 20 Feb. 1831; d. Philadelphia, Pa., 11 Feb. 1911. He studied at the Christian Brothers' school in Thurles and began his classical course at Mr. Naughton's school, parish of Rathmines. Determined to become a missionary in the United States, he entered Carlow College and after receiving sub-deaconship there, came to the diocese of Saint Louis, Mo. He was ordained to the priesthood in 1853, made rector of the cathedral and subsequently appointed pastor of the Church of Saint John the Evangelist and vicar-general of the Saint Louis diocese. In 1868 Father Ryan accompanied Archbishop Kenrick to Rome and while there preached a series of Lenten sermons that elicited great praise. On 14 April 1872, he was consecrated Titular Bishop of Tricomia and coadjutor to Archbishop Kenrick and on 11 Jan. 1894 was elevated to the titular archbishopric of Salamis, being transferred the same year to the archiepiscopal see of Philadelphia. In 1883 he was among the United States prelates chosen to visit Rome in the interest of the Catholic Church in America. He gave two annual inaugural addresses at the State University of Missouri, lectured twice before the representatives of the Missouri legislature and delivered discourses in nearly all the large cities of the United States, notable among these lectures being that on Modern Skepticism. He published 'What Catholics Do Not Believe,' and 'The Causes of Modern Religious Skepticism.' In 1902 President Roosevelt appointed Archbishop Ryan a member of the Indian Commission and he was a member of the Executive Board of Catholic Indian Missions. The archdiocese of Philadelphia, over which he so ably presided, has a Catholic population of about 475,000; more than 500 priests; 240 churches; 117 parochial schools; 5 hospitals and 12 orphanages besides many benevolent and educational institutions.

**Ryazan**, rē-i-sān'. See RIAZAN.

**Rybinsk**, rē'bēnsk, or **Rubinsk**, Russia, in the government of Yaroslavl, 52 miles northwest of Yaroslavl, on the Volga, at the confluence of the Rybinsk. As the port of Saint Petersburg, it is one of the most important points of north central Russia. It became a centre of traffic when the three canal systems connecting Saint Petersburg with the Volga were opened. Its enormous business of transshipment and active trade in grain and hemp, during the season, increases the population by nearly 100,000 workers. Permanent pop. about 30,000.

## RYDAL - RYE

**Rydal**, England, a picturesque village in the county of Westmoreland, two miles northwest of Ambleside. It is situated in a narrow gorge formed by the projection of two mountains near Rydal Lake. The lake, only half a mile in area, contains two beautiful islets, is encircled by meadows and dominated by rocky heights which add to the charm and calm beauty of the surroundings, so celebrated in English literature. Rydal Hall is a fine mansion in a park which contains many grand forest trees and a cascade immortalized in verse by Wordsworth, who lived for some years at Town End, near by, the residence also for a time of De Quincey.

**Rydberg**, rüd'bërg, Abraham Victor, Swedish writer: b. Jönköping 18 Dec. 1829; d. Stockholm 21 Sept. 1895. He studied at the University of Lund, and in 1855 entered journalism, contributing to the leading paper of Gothenburg. In 1868 he was sent to an assembly of the church where he was the champion of liberal ideas, and from 1870 to 1872 sat in the Riksdag. In 1882 he became professor of the history of civilization at Stockholm. He is the author of 'The Pirate of the Baltic' (1857); 'The Last of the Athenians' (1859), which has been translated into English, German, and Danish; 'The Doctrine of Christ According to the Bible' (1862); 'Magic of the Middle Ages' (1864); 'Romish Legends of the Apostles Peter and Paul' (1871); etc. His works include studies in æsthetics, philosophy and psychology, besides poetry and a translation of Goethe's 'Faust,' and he is regarded as one of the foremost Swedish men of letters.

**Ryde**, rid, England, a watering-place in the Isle of Wight, on the Spithead shore, seven miles east-northeast of Newport. It is regularly laid out on a sloping site, and is a picturesque, elegant, and well patronized summer-resort, having regular and frequent steamboat communication with Portsmouth, Portsea, Southsea, etc. Pop. about 13,000.

**Rydelski**, Andrew, Swedish prelate and scholar, b. Linköping, in 1671; d. 1738. He studied under John Bilberg, and became instructor of philosophy and theology at Lund, where later he was appointed bishop. In 1718 he published a 'Course of Philosophy'; his other works include 'Grammatista Philosophans'; 'Sententiz Philosophiz Fundamentales'; 'Orationes Academicæ.'

**Ryder**, ri'der, Albert Pinkham, American artist: b. New Bedford, Mass., 19 March 1847. He studied his profession under William E. Marshall and in the art schools of the National Academy of New York. He has made a specialty of pastoral landscape and has been styled 'the last of the Romanticists.'

**Ryder**, William Henry, American Universalist clergyman: b. Provincetown, Mass., 13 July 1822; d. Chicago, Ill., 8 March 1888. He engaged in preaching when 19 and at 21 became pastor of the First Universalist Society in Concord, N. H. He afterward preached at Nashua for two years and then traveled in the Holy Land. In 1850 he accepted the pastorate of the Universalist Church at Roxbury, Mass., from which he resigned in 1860 to become pastor of Saint Paul's Church, Chicago. At his death he bequeathed more than half a million dollars

to various charitable, educational, and religious organizations without regard to any difference in creed.

**Rydqvist**, John Erik, Swedish author and critic, b. Gothenburg 20 Oct. 1800; d. 19 Dec. 1877. He abandoned trade in 1820 to study law and ancient languages, and in 1827 received a civil appointment in the central administration. He became known by his literary and critical works, joined the staff of the Royal Library at Stockholm, and in 1843 was appointed chief librarian. The same year he succeeded Berzelius as member of the Swedish Academy. Besides numerous translations of Greek and English works into Swedish, literary and critical essays published in various collections, notably in the 'Heimdal,' a critical review that he conducted from 1828 to 1832, his principal works include 'The Chief Literary Events of Past Ages' (1828); 'The Most Ancient Stage Works of the North' (1836); 'The Civil Service in Sweden' (1838); 'J. Olof Wallin' (1839), a biographical study; 'Travels in Germany, France and Italy' (1838); and 'The Laws of the Swedish Language' (2 vols. 1850-57), a philological work of great value.

**Rye**, N. Y., a town of Westchester County, on the New York, New Haven & Hartford R.R., eight miles northeast of New Rochelle. Rye was founded in 1660, and five years later was organized as a town of Connecticut, the border line not being settled until 1700. One of Rye's interesting features is the Jay homestead, where John Jay spent his youth. Port Chester, a manufacturing village is within the boundaries of Rye, and Rye Beach on Long Island Sound, with its picturesque colony of bungalows, cottages and shacks, is a favorite summer resort for bathing, boating and other recreations. Pop. (1910) 3,964.

**Rye** (*Secale cereale*), a plant of the grass family, and allied to wheat, which yields the fifth most important cereal crop in the United States. It is an erect hardy annual, with slender stiff culms from four to six feet high, flat leaves, and a terminal, compact, somewhat flattened, bearded spike from four to six inches long. The spikelets are usually two-flowered, sessile, compressed, alternate, convex on one side and flat on that next the rachis. The outer glume is keeled and often carries a short awn, while the flowering glume carries a long awn. Each floret has three stamens and two very short styles. The grain is oblong, furrowed on the inside, hairy at the apex and generally free from the flowering glume and palea. The plant is not found wild, but is believed to be indigenous to the country bordering the Black and the Caspian seas. The granules of rye-starch are larger than those of wheat or barley, some being .0016 of an inch in diameter. The form of the larger ones is that of a flattened disk with a depressed centre having cracks on its outer edge. The hilum is central with lines radiating almost to the circumference.

Rye is harder than wheat and is usually cultivated in cool regions on sandy or light soils, and in the Eastern States on medium loams which have become physically or chemically defective and will not produce satisfactory wheat crops. It will thrive on reclaimed peaty soils. In the rotation, rye occupies the same place that wheat would, and, like the latter, prefers a fine

## RYE-GRASS — RYE-HOUSE PLOT

firm seed bed. For a grain crop, from 1½ to 2 bushels per acre are usually sown in the autumn. Judicious rolling and harrowing in spring is often beneficial. The crop is harvested just before it is fully ripe, a good yield varying between 15 and 30 bushels of grain and from one to two tons of straw. The straw is particularly tough and pithy and of little feeding value. It takes a long time to rot in the manure heap when used as litter, unless it is chaffed.

Two types of rye are grown, the common or autumn-sown usually grown for grain, and the spring-sown usually sown in spring, but the former may be sown in spring and the latter in autumn. Midsummer or Saint John's Day rye and giant or Tyrolese rye are spring varieties and good for forage, the latter requiring a rich soil. When grown for forage, as a cover crop, or to be plowed in as green manure, three bushels of rye may be sown per acre at various seasons of the year, the only proviso being that there shall be sufficient moisture and warmth present to insure germination and growth. Green rye is an excellent feed, either for soiling or folding in the spring, being well suited for cows in milk or ewes with lambs. As soon as the ear appears the straw becomes tough and woody, so that stock refuse it, hence it should be grown in small areas and a succession put in. A bushel weighs about 56 pounds and each pound contains on an average about 21,000 kernels.

**Feeding Value and Uses.**—In northern Europe the grain is largely used for bread-making, but in this country it is chiefly employed either in the manufacture of malt and spirituous liquors, as rye whiskey, etc., or as food for stock. Holland's gin and the national Russian drink, kvass, are largely made from rye. The following table shows that rye does not differ materially from wheat in composition, nor are its by-products chemically dissimilar from those of the wheat grain:

| Average percentage composition of | Water | Ash | Protein | Crude fiber | Nitrogen-free extract | Ether extract |
|-----------------------------------|-------|-----|---------|-------------|-----------------------|---------------|
| Rye .....                         | 11.6  | 1.9 | 10.6    | 1.7         | 72.5                  | 1.7           |
| Rye flour...                      | 13.1  | 0.7 | 6.7     | 0.4         | 78.3                  | 0.8           |
| Rye bran...                       | 11.6  | 3.6 | 14.7    | 3.3         | 63.8                  | 2.8           |
| Rye shorts..                      | 9.3   | 5.9 | 18.0    | 5.1         | 59.9                  | 2.8           |

The percentage digestibility of rye meal with ruminants is dry matter 87, protein 84, nitrogen-free extract 92, ether extract 64; while that of rye bran with pigs is dry matter 67, protein 66, nitrogen-free extract 75, ether extract 58.

In milling the outer portion of the rye kernel constitutes the bran, the second layer the "middlings" or "shorts," and the inner portion the flour. For stock the whole kernel is ground. Rye flour is somewhat similar to corn meal as a source of protein and energy, but is more expensive. Ground rye and rye bran are fed to cows in Denmark. Not more than 3 pounds daily should be given, as they are said to have a deleterious effect upon the quality of the butter. Experiments show that for pig feeding rye is of equal value with barley, and that one pound of rye is equal to six pounds of separated milk or twelve pounds of whey; that rye shorts are inferior to rye, the pork from the former being softer and showing more shrinkage. Ground rye

may be safely fed to work horses to the extent of 8 or 10 pounds daily, together with other feeds, as bran or oats. Owing to the hollow stems of rye holding considerable air, this crop is not making much progress for silage purposes.

Rye straw is longer and more uniform in size than that of other grains and when unbroken it is used for packing pottery, horse collars, mattresses, etc., and in the manufacture of a variety of articles, as paper, hats, bonnets, mats, slippers, toys and fancy articles. For such purposes, it often commands a good price.

**Diseases.**—Ergot (*Claviceps purpurea*) is the chief disease and is common on other graminæ. The elongated, curved, brownish or purplish spurs of ergot form on the head in place of a kernel and are sown with the seed unless it is carefully screened. If sown, they germinate and finally send out minute spores which, attaching themselves to the grass, live on it parasitically, send out small thread-like growths which finally reach the ovary, where they displace the rye grain and reproduce the cockscur or resting spore. Ergot should be removed before rye is used as feed; it is dangerous to man and beast.

**Statistics.**—In 1910 the world's crop of rye was 1,675,898,000 bushels and the production of the United States, 33,039,000 bushels, both being almost the high record. In 1910 the leading countries growing rye were Russia, 843,699,000 bushels; Germany, 413,802,000 bushels; Austro-Hungary, 166,372,000 bushels. The average yields per acre for the past eight years are Germany 22.6 bushels; Austro-Hungary 16.1 bushels; United States 15.0 bushels; Russia 11.6 bushels. In 1902 the average yield of the United States was 17 bushels per acre, valued at 50.8 cents per bushel, or \$8.63 per acre. In 1910 the leading States were Pennsylvania, 6,460,000 bushels; Michigan, 5,355,000 bushels; Wisconsin, 4,880,000 bushels; New York, 3,111,000 bushels; New Jersey, 1,530,000 bushels, and Illinois and Nebraska, each over 1,200,000 bushels.

SAMUEL FRASER,

Instructor in Agronomy, Cornell University.

**Rye-grass.** See GRASSES OF THE UNITED STATES.

**Rye-house Plot,** in English history, a conspiracy which took place in the reign of Charles II., and which became famous from the fact that its detection involved the death of Lord William Russell, Lord Essex, and Algernon Sidney, who were in no way connected with it. The immediate object of the Rye-house Plot, which was contrived in 1683 among a number of obscure persons belonging to the party of which those celebrated men were among the leaders, was to assassinate the king and his brother, the Duke of York (afterward James II.), as they returned from the Newmarket races. This plan was to have been executed at a convenient spot on the road from Newmarket to London, where there was a farm called Rye-house, belonging to one of the conspirators name Rumboldt; but the plan was frustrated by the king and his brother happening to return from Newmarket earlier than was expected. Soon after information of the matter was laid before one of the secretaries of state, and it was added that since this plot had been frustrated the plan of a general insurrection had been taken up by various eminent persons, among whom were those mentioned.

A general insurrection had indeed been talked of among the accused persons, and the details and probable success of such a scheme appear to have been considered by them; but there was no evidence whatever to show that the promoters of the wider scheme were in any way involved in the minor plot, which was got up, after the general insurrection had first been talked of, by a few of those who were already concerned in the larger plan. Yet from the way in which the revelations were made to the government the two schemes were completely confounded, and Russell, Essex, and Sidney were arrested on the charge of treason. Essex put an end to his own life in the Tower, and Russell and Sidney were condemned and beheaded. Lieutenant-colonel Walcott, one of the real contrivers of the Rye-house Plot, was at the same time brought to the block.

**Ryerson, ri'er-són, Adolphus Egerton,** Canadian Methodist: b. Charlotteville 24 March 1803; d. Toronto 19 Feb. 1882. He entered the Methodist ministry in 1825; and became identified with the Methodist Episcopal Church of Canada at the organization of that body in 1828. In 1832 went to England to form a connection with the parent body. In 1842 he became first president of Victoria College and in 1845 was appointed superintendent of education for the province of Upper Canada, a position he retained for 30 years. Besides founding and editing 'The Christian Guardian,' he wrote 'A Manual of Agricultural Chemistry'; 'The Clergy Reserve Question'; 'Compulsory Education.' Consult: Egerton Ryerson, 'The Story of my Life' (1884).

**Ryland, ri'land, Henry,** English artist: b. Biggleswade, Bedfordshire. He was trained in art at the South Kensington schools and worked at Paris in the studio of Benjamin Constant, and at Julian's Academy under Boulanger and Lefebvre. His practical professional life was begun by him as a designer of stained glass and he contributed to the 'English Illustrated Magazine' in its early days. His first work as a painter was exhibited at the Grosvenor Gallery, but he has since exhibited, chiefly watercolors, at the other exhibitions of London, and many of his pictures have been engraved.

**Ryle, ril, John Charles,** English Anglican bishop: b. Macclesfield, Cheshire, 10 May 1816; d. Lowestoft, Suffolk, 10 June 1900. He was educated at Oxford, took orders in the English church, and was successively curate at Exbury, rector of St. Thomas', Winchester (1843), of Helmingham, Suffolk (1844), and vicar of Stradbroke, Suffolk (1861). He was appointed honorary canon of Norwich, in 1872, and in 1880 was nominated Dean of Salisbury, but before he

had taken possession of this post was made bishop of the newly formed see of Liverpool. He was one of the most prominent members of the Evangelical party, and besides publishing numberless tracts which were widely popular, was author of such books as 'Coming Events and Present Duties' (1867); 'Bishops and Clergy of Other Days' (1868); 'The Christian Leaders of the Last Century' (1869); 'Expository Thoughts on the Gospels' (1856-69).

**Rymer, ri'mér, Thomas,** English critic and antiquary: b. Yaforth, Yorkshire, 1641; d. London 14 Dec. 1713. He studied at Cambridge, subsequently kept terms at Gray's Inn, and was called to the bar in 1673. In 1678 he published 'Edgar, a Tragedy.' In 1692 he succeeded Shadwell as historiographer royal, and was entrusted with the preparation of a collection of public treaties, which he began to publish in 1704, under the title of 'Fœdera, Conventiones, et cujuscunque Generis Acta publica, inter Reges Angliæ et alios Principes.' Of this valuable and learned work he completed 15 volumes, and five more were afterward added by Robert Sanderson. The publication of the whole work was completed in 1735.

**Rymer, Thomas, of Ercildoune.** See RHYMER, THOMAS TER.

**Ryotwar, ri'ôt-wâr,** in India, the lease of land by the government officers to the ryots or native cultivators at a fixed rent, a practice chiefly prevalent in the Madras Presidency.

**Rysbrack, rüs'bräk, John Michael,** German sculptor: b. Antwerp 1693 or 1694; d. 8 Jan. 1770. He went to England in 1720 and made a reputation by the exercise of his art, of which Westminster Abbey and several cathedral churches contain examples, among which may be mentioned the monuments of Sir Isaac Newton and the Duke of Marlborough. He also executed the equestrian statue of William III., at Bristol, and the statue of Locke at Oxford.

**Ryswick, riz'wik (Rijswijk),** Netherlands, a village between Delft and The Hague, famous for the celebrated treaty concluded in 1697, and known as the 'Peace of Ryswick,' signed by France, England, Spain, and Germany. It terminated a bloody war waged by England against France. Louis XIV. relinquished his recent conquests except Strasburg, which was taken in 1681. He also acknowledged William III. king of Great Britain and Ireland.

**Rzheff, rzhéf, or Rjev,** Russia, in the Tver government, occupies the heights on both banks of the Volga. It is a railway terminus, 89 miles southwest of Tver, and the centre of a great transit trade between the provinces of the lower Volga and the ports of Saint Petersburg and Riga.

# S

**S** the nineteenth letter and fifteenth consonant of the English and several other alphabets, is classed as a sibilant or hissing letter. The sibilant is of two kinds, one produced merely by emission of the breath while the end of the tongue is brought close to the front palate just behind the gums: this is the hard open sound; the corresponding soft open sound is represented in the alphabet by *z*, but in practice is often represented by *s*. The form *S* is the ancient Greek character  $\varsigma$  with its angles rounded: in the existing Greek alphabet the *s* is represented by  $\sigma$ . In some English words *s* is silent: island, aisle. The final *th* of verbs has changed to *s* because of the nearness of sound of *s* to *th*: loveth, loves; bath, has. There are several words in English—and the like can be said of Greek—which, beginning with *m* or *p* or *l*, take on an initial *s*; melt, smelt; pile, spike; lick, alick; Gr. mikros, amikros: compare Ger. niesen, Eng. sneeze. Sometimes the sound of *s* is changed to that of *st*: the verb hoise becomes hoist, whiles becomes whilst; and there is the mispronunciation of once, onst; and the plural of mouse is mice. The digraph *sh* stands usually for the ancient *sc* (*sk*): Old Eng. sceal, shall, fisk, fish.

**S. P. Q. R.**, the initial letters of *Senatus Populusque Romanus* (the Senate and the Roman people), which was supposed to express the political character of the Latin nation. These initials were carried as a battle standard by the Roman armies.

**Sa de Miranda, Francisco de, frân-thêr'kô dâ sâ dâ mē-rân'dâ**, Portuguese poet: b. Coimbra, Portugal, 27 Oct. 1495; d. there 15 March 1558. He wrote much in Spanish, taking for his models Dante and Petrarch, but in sentiment remained entirely loyal to his native country. His fame rests chiefly upon his poetical epistles and eclogues, though his entire work is excellent, and characterized by sincerity and love of natural beauty. He is ranked as one of the six greatest Portuguese poets. An edition of his work edited by Carolina Michaëlis de Vasconcellos contains 189 of his pieces, 74 of which are in Castilian.

**Saadja Gaon, sâ-id'yâ gâ-on'** (SAADJA BEN JOSEPH, Arab SAM), Jewish Rabbī: b. Fayum, the Biblical Pithom, Egypt, 892; d. Babylonia 941. In 828 he was appointed Gaon or principal of the Jewish Academy at Sura, near Babylon, into which dwindling institution his zeal and learning infused new blood. His acquirements were many and varied, and he lived in a time when philosophy and reason were in danger of usurping the authority hitherto wielded by tradition, and especially were the Karaites inclined to

discard the latter. It was the work of Saadja to discover a common ground for the maintenance and support of Jewish dogma side by side with philosophical theory. This was the object of his great work, written in Arabic, 'Emunot w'deot' ('Faith and Ethics') which was translated into Hebrew by Juda ibn Tibbon (1160) and into German by Fürst (1845). Saadja wrote a commentary to some of the books of the Old Testament, treatises on grammar, and hymns for the synagogue. On the 1000th anniversary of his birth a complete edition of his works was published by Joseph Derenbourg. Consult Grätz, 'Geschichte der Juden' (1870); Guttman, 'Die Religionsphilosophie des Saadja' (1882).

**Saale, zâ'lê**, Germany, the name of several rivers, flowing between Baireuth and Hof, in the northeast of Bavaria. The most important of these is the river rising in the north side of the Fichtelgebirge at an altitude of 2,390 feet. It is navigable from Naumburg and passes Kahla, Jena, Kainburg—it becomes very circuitous, passing Merseburg and Halle, and finally connects with the Elbe, near Leipsic, by canal. It flows through a fertile and picturesque valley for 200 miles, its romantic heights crowned by many castles. It is of great commercial value, having a wide and deep channel in the greater part of its length.

**Saarbrücken, zâr-brûk-ên, or Sankt-Johann Saarbrücken**, Germany, in the Rhine province, Prussia, is situated on the Saar, 39 miles southeast of Treves. Its sister-town across the river gives the town the double name. It is an important industrial centre, is well-built, and has a castle. There is a mining academy and a monument to Bismarck. The principal industries are wool-spinning, brewing, and the manufacture of tobacco, chemicals, tin, and stoneware. Trade is mainly dependent on the coal mines, the glass and iron works of the district. In 1870 the French and Prussian forces fought here the first engagement of the Franco-German war resulting in a partial victory to the French, which the Germans retrieved four days later by their first victory in the vicinity. Pop., including Sankt-Johann about 47,000.

**Saba, sâ'ba**, one of the Leeward Islands, Dutch West Indies, area five square miles. It is high and rocky, rising abruptly from the sea to a height of nearly 3,000 feet. A small proportion of the area is under cultivation; the chief products are tropical fruits and vegetables, especially cabbages, and cotton. Fishing is also an important industry, and fishing boats are built on the island. The inhabitants are the descendants of Dutch and Scandinavian pirates who occupied the island in the 17th century. The

## SABADILLA—SABATIER

Island nominally belongs to Holland, but the people are practically independent, being exempt from taxes and electing their own governor. Pop. about 3,000.

**Sabadilla**, or **Cevadilla**, the pharmaceutical term for seeds of a liliaceous plant (*Schmoeoulon officinale*), growing in Central America, with a bulbous root, grass-like leaves and a flower-stalk some six feet in height. The papery, tri-capsular fruits contain a few pointed, wrinkled, blackish seeds, persistently acrid and sternutatory, a powerful irritant and poisonous. They are employed for preparing veratrine, which in the form of a tincture or ointment, is used as an external application for neuralgia and rheumatism, but is likely to prove poisonous if the skin be broken, thus permitting absorption. Sabadilla has also been given as a dangerous vermifuge, and is used for killing vermin.

**Sabæaniam**, sâ-bé'an-izm, or **Sabianism**, a religion whose believers were once numerous in Arabia, Syria and Mesopotamia, which while it recognized only one supreme being, also worshipped, or paid high reverence to angels, or inferior divinities, supposed to reside in the stars. This part of the Sabæan creed virtually amounted in practice to star-worship.

**Sabæana**, sâ-bé'an-z, the ancient name of the inhabitants of the modern Yemen, in Arabia. Ptolemy places them in the north and middle of what is now called Yemen, and earlier geographers to the south of that province; but the fact appears to be that they were a race dwelling on both sides of the Red Sea on its southern shores, in Arabia and Ethiopia. The names applied to the peoples dwelling on the different sides of the Red Sea were very like, Shebaim being that of the Arabian section, and Sabaim that of the Ethiopian. The country of the Shebaim was probably the Sheba of the Bible, the land of the queen who came to visit Solomon. It was fertile and rich in spices and perfumes, and carried on an extensive trade with the East.

**Sabæism**, the name derived from Hebrew and Arabic, given to the worship of the stars as deities. It extended through the countries of the Assyrian and Medo-Persian empires as far as Asia Minor, between the Caspian Sea, the Euxine, and the Mediterranean, from the Armenian Mountains as far as the banks of the Nile and southern Arabia; but it assumed different forms in different countries, appearing sometimes more sensual, sometimes more spiritual. The objects of worship were the sun, the moon, and the planets, or rather the planetary spirits of which the planets were believed to be the frame or the body. The worship of the sun was especially cultivated in Babylon and Phœnicia. The worshippers of the stars generally ascribed to them a great influence upon and a knowledge of terrestrial affairs; and astrology, the casting of nativities, and various systems of demonology, were therefore the natural result of Sabæism. The astrological system was most largely developed by the Egyptians, while Parseeism was the purest and most perfect form of Sabæism. In the Koran the star worship of ancient Arabia is designated by the name Sabæism. In the town of Haran, in Mesopotamia, a kind of Sabæism maintained itself, surrounded on all sides by Christianity, until the Middle Ages. One sect of Sabæans believed in the migration of the

soul, and in great world-periods, constantly renewed in an everlasting revolution, a view sustained to a certain extent by modern philosophy.

**Sa'bal**, or **Cabbage Palmetto**, the most northern arborescent palm in the world. It is a tree attaining 80 feet in height. Until it is from 10 to 20 feet high, its straight, robust stem is surrounded by the dry fibrous sheaths, and the stubs of petioles, of leaves, projecting like spines, and giving a very picturesque and characteristic appearance. The leaves, massed at the top of the trunk are cordate, or fan-shaped, narrowly pinnatifid, each division cleft at its apex and recurved at the summit. The terminal bud, by which growth is continued, or "cabbage," is a favorite delicacy with the negroes, who cut it out of the young and healthy trees,—thereby causing the ultimate death of the palmetto—and cook it as a vegetable. Many palmettoes are killed by the removal of the tops of the young trees. These tops are sent to factories, where they are trimmed down to a disk some eight inches thick, the soft central parts are cut out, and the disk is then boiled to loosen the fibres of the sheaths and petioles, which are made into scrubbing brushes. These buds for brushes are worth only about 6 or 7 cents apiece, and yet the trees are being exterminated for so slight returns. The mature leaves are used for thatching, and the trunks resist teredos to such an extent that they are valuable for sub-marine pilings.

This palmetto has always been interwoven with the history of South Carolina, the "Palmetto State." A fortification, or stockade, on Sullivan's Island in Charleston Harbor, 1776, was composed of earth and palmetto logs, and succeeded in repulsing the attacking British fleet under Sir Peter Parker, whose shot had practically no effect on the wall, for they could not split the spongy trunks, but were imbedded in them. Therefore, in memory of this event, the palmetto tree appeared on the seal of South Carolina, over an uprooted branchless oak-tree representing the oaken ships of England; on a flag adopted after the Ordinance of Secession (1861) was passed; and also on a medal. At the signing of the secession ordinance, palmetto trees flanked the platform, and at the back was the banner of the convention, bearing among other curious devices, a most unnatural palmetto, with a gigantic rattlesnake wound about its trunk. Cockades, rosettes of blue ribbon with a palmetto imprinted on a button in the centre, were worn by Charlestonians in 1860-1.

**Sab'alo**, a name of the tarpon (q.v.), further known as *savalle*, *savanilla*, *grande ecaille*, *silver-king*, etc.; also of the Hawaiian milk-fish (*Chanos chanos*).

**Sabaoth**, sâb'a-ôth, or sâ-bâ'ôth, Lord God of, a term used in the Scripture, meaning "Lord God of Hosts." It has no connection with the word Sabbath.

**Sabatier**, sâ-bâ-tê-â, Paul, French theologian and historian: b. Saint-Michel-de-Chabreil-lanoux, Ardèche, 3 Aug. 1858. He was educated in the theological faculty of Paris, and in 1885 became vicar of the French parish of Saint Nicolas at Strasburg. The German government offered him a superior appointment, involving his becoming a German citizen; he requested to be allowed to retain his post as vicar, but the request was viewed as a political manifestation, and he was banished the coun-

try. For a brief time he was pastor of Saint George la Serre; then he withdrew from the ministry to devote himself wholly to historical studies. His chief work is 'La Vie de Saint François d'Assise' (1893), based largely on previously unutilized documents discovered by him in various Italian archives. Within a year from the appearance of the first French edition, editions had appeared in almost all Continental languages, including Swedish and Polish. The Russian version was prepared under the direction of Tolstoy. Sabatier published also 'La Didaché ou l'Enseignement des Douze Apôtres' (1885), and editions of the 'Speculum Perfectionis' by Leo of Assisi (1898; translated into English by S. Evans as 'St. Francis of Assisi, the Mirror of Perfection' (1898), and of the 'Tractatus de Indulgentia' (1900), of Francisus Bartholus. Consult article by Rawnsley in 'Contemporary Review, V. 74, pp. 505-18 (1898).

**Sabazius**, sa-bá'zhf-ús, a Phrygian divinity, identified by the Greeks in part with Zeus and in part with Dionysus. His symbol was a serpent. His worship extended to Greece, and was found also in Italy, especially in late pagan times. He was said to have been the first to employ oxen for plowing.

**Sabbatai Zevi**, sá-b-bá'tf' zé-vé', whose name is also spelled 'Sabtai Zefi' and Sabbathais Zevi, a pretended Messiah b. Smyrna 1641. He was a man of great learning and magnetic presence, and he led thousands of followers, mainly in Smyrna, Salonica, Alexandria, and Jerusalem, to believe in him as the Messiah. In 1664 he had about 80,000 followers, in the following year the beginning of the Messianic reign within a few months and the rebuilding of the Temple in the next year were proclaimed in the streets of Alexandria by Sabbatai and six disciples, clad in white raiments, with garlands on their heads. Having excited serious alarm at Constantinople, he was apprehended at Smyrna, and terrified into a recantation of his mission. He was said to have declared that his sole object had been to embrace Islam, and to carry over all the Jews with him. The sultan declared himself satisfied, and honored him with the title of an effendi, giving him an honorary post at the same time. He again aroused the jealousy of the Turks, and was either poisoned in prison, or publicly executed.

**Sabbatarian Controversy**, the dispute in various forms between those who urge and those who oppose a rigid observance of Sunday. It has been going on from the time of King James I., of England, who favored Sunday sports, and thereby offended many of his subjects, and it has in late years included proposals to throw open to the public museums, libraries, and galleries, and other places of recreation and instruction, on the first day of the week. Most of these changes have been generally adopted. The proposition to permit the sale of alcoholic liquors in saloons on Sunday is at present the chief feature of the Sabbatarian Controversy.

**Sabbatar'ians**, a term applied to those who urge rigid observance of Sunday. It was applied also in earlier times to the sect now known as Seventh Day Baptists, who observe Saturday for Sunday, and who, for that reason, are permitted in Rhode Island, where they are comparatively numerous, to work on Sunday.

**Sabbath**, the ancient Hebrews' weekly day of rest. In Hebrew the word means week, and the expression of Josephus (Apion ii. 2), who explains it as meaning "a rest from all labor," is rather to be looked upon as a commentary than as a derivation etymologically correct.

The Sabbath was the seventh day of the Hebrew week and lasted from sunset on Friday to sunset on Saturday. It was celebrated as a holy day; a day of rest and rejoicing; by ceasing from all labor, and by causing servants, strangers, and cattle to cease also. Plants even were to rest; they were neither to be sown nor reaped on that day. The services of priests and Levites in and about the tabernacle and temple were, however, to be performed through the Sabbath-day. Circumcision, too, could take place on the Sabbath, when it fell on the eighth day after the birth of a male child.

Profanation of the Sabbath was punished by stoning to death. It was not until after the exile that the character of the work by which the Sabbath could be profaned was strictly defined. In the law only one act of labor was specifically prohibited, that of lighting a fire for the purpose of cooking. According to Josephus armies never proceeded on their march on the Sabbath. The Pharisees forbade even the plucking of grains of corn on that day; the healing of a sick man; or the walking of a cured patient bearing his bed. According to the Mishna even a broken bone was not to be set, nor dislocations poulticed or bound up on that day.

**Origin of the Sabbath**.—The Sabbath appears to have been an institution of religion long prior to Moses. It is sometimes said that it was borrowed by him from older nations, such as the Egyptians. Such Latin writers as Seneca and Ovid give intimations that the veneration for the seventh day had found some favor among the early Romans. It seems more natural to suppose that it had come down with the old traditions of theocratic religion which are found embalmed in the first chapter of Genesis. The poem of the creation, in which God is related to have created the world in six days and rested on the seventh day, embodies a tradition much earlier than the period of Mosaic legislation. There are several intimations in the patriarchal age that the followers of Jehovah, such as Abraham and Isaac, chose certain times for rest, meditation, prayer and sacrifice to God. In after times it would almost seem as if the poem or hymn of the creation was used as a special part of Sabbath-day devotions. On that day the people were called to reflect upon the fact that the whole universe, including themselves, had an origin in one personal and supreme Being, that He had exerted His Omnipotence for a definite period and then had ceased from His work. They were constantly to remind themselves of the work of God, once for all completed, by their own six days' round of labor; and as God had rested from His work so were they to rest from theirs and to turn their thoughts toward Jehovah "who had done so great things for them."

**Mosaic Ordinances of the Sabbath**.—The scope and meaning of the Sabbath-day was very much extended and amplified by the provisions of the law as contained in the Hexateuch. It was made to be a day on which not only the finished task of creation was to be commemorated, but on which the great providential deliv-

erances of the children of Israel were likewise to be recalled. But first of all the command is given by the law in various forms of speech, but with the same intent throughout the books of the law, Exodus, Deuteronomy, and Leviticus, to remember the seventh day, the Sabbath, to keep it holy; most specifically in Lev. xxiii. 3: "Six days shall work be done: but the seventh day is the sabbath of rest, an holy convocation; ye shall do no work therein: it is the sabbath of the Lord in all your dwellings."

First of all there are three specifications as to the manner in which the week is to be spent: (1) by labor—"Six days shalt thou labor, and do all thy work:" (Ex. xx. 9); (2) by rest on the seventh day; on this day the people are ordered to rest, literally to take breath, then are enumerated in detail those who are enjoined from work: "Thou, nor thy son, nor thy daughter, thy manservant, nor thy maidservant, nor thy cattle, nor the stranger that is within thy gate." The penalty of death is threatened against all who shall disobey this command. The reasons of this command are given: (1) as a counsel of mercy—"Six days thou shalt do thy work, and on the seventh day thou shalt rest, that thine ox and thine ass may rest, and the son of thine handmaid, and the stranger, may be refreshed" (Ex. xxiii. 12); (2) as a commemoration of the deliverance from Egypt—"And remember thou wast a servant in the land of Egypt, and that the Lord thy God brought thee out thence through a mighty hand and by a stretched out arm, therefore the Lord thy God commanded thee to keep the sabbath day" (Deut. v. 15); (3) as a commemoration of the finished creation "For in six days the Lord made heaven and earth, the sea, and all that in them is, and rested the seventh day: wherefore the Lord blessed the sabbath day, and hallowed it" (Ex. xx. 11); (4) as a sign of the covenant, just as circumcision was the sign of the Abrahamic covenant, and the rainbow the sign of the covenant with Noah—"Speak thou also unto the children of Israel saying, Verily my sabbaths ye shall keep, for it is a sign between me and you throughout your generations, that ye may know that I am the Lord that doth sanctify you. . . . It is a sign between me and the children of Israel for ever: for in six days the Lord made heaven and earth, and on the seventh day he rested, and was refreshed" (Ex. xxxi. 13, 17).

The Jews of to-day who profess to keep up the tradition of their fathers still keep the Sabbath as a joyful festival. The Sabbath is held from Friday evening to Saturday evening. It is among some of them considered a pious observance to begin the celebration half an hour before Friday's sunset and to continue it half an hour after sunset on Saturday for the benefit of the souls of those who are in torment, for they believe that the damned are allowed a mitigation of their suffering during the feast. On Friday afternoon all the food for the following day is prepared, and their festal array is laid out for the Sabbath. Some Jews have special raiment which they wear only on that day; on the morning of which the Sabbath lamp is lit and the Sabbath bread laid on the table. The master of the house at the close of the evening meal blesses the wine and passes it round. They eat three meals on the Sabbath-day and they

have a maxim that it is good to honor the day in the body, in dress, in eating, and in drinking.

*The Lord's Day.*—A careful consideration of early Church history and early Church writers leads to the conclusion that the day of Christ's resurrection, the first day of the week, grew up, coeval with the existence of Christianity itself, as the one distinctively Christian festival, which was made to fall in with the injunction to periodical rest, founded on the earliest traditions of biblical religion and provided for under Moses by special legislation for the observance of the Sabbath. Nevertheless the idea of the Lord's Day is wholly distinct from that of the Sabbath, which seems to have been likewise observed by the early Church, although sometimes as a fast. The Saturday half-holiday, which still survives in some countries or at some seasons of the year, is certainly derived from this double observance. The tendency to sabbatize the Lord's Day was perhaps due to certain imperial decrees of the Christian emperors beginning with Constantine, who closed the law courts, etc., on what Justin Martyr calls "the day of the sun," and what Constantine speaks of as "venerable Sunday."

Civil legislation on behalf of the observance of Sunday began in the Roman empire in an early part of the 4th century, as in the statute of Constantine (321), which runs as follows: "On the venerable day of the sun let all magistrates and people residing in the city rest, and let all workshops be closed. In the country persons engaged in agriculture may, however, according to their will and without violating this law, continue their toil, for often another day is not so suitable either for sowing grain or for planting vines; and if the proper opportunity for such operations be lost the bounty of heaven may be disappointed." While Constantine permitted the legal freeing of slaves and the visitation of captives on Sunday, he prohibited the prosecution of lawsuits. Theodosius (386) published a decree suspending the theatrical shows and circus races on Sunday. These historical facts are important as bearing on the present Sunday laws in England and America.

The Frank emperors kept up the observance of the Lord's Day by their capitularies or general statutes; and even during the French Revolution, when the Christian calendar was abolished, each tenth day was made a day of rest, and public offices, schools, workshops, and shops of merchandise, excepting those of food and medicine, were ordered to be closed. The Code Napoléon ordered the observance of Sunday.

In England the observance of the Lord's Day has been enjoined by statute from the earliest times. Canute (1026-35) prohibited marketing, hunting, and the holding of local courts on that day. After the Conquest the conduct of the people with regard to trade, sports, and the law courts was controlled by special statutes.

The most important legislation on the subject of Sunday usage is that which was promulgated in the reign of Charles II. (1676). By the law then passed a prohibition is imposed upon all worldly labor or business excepting works of necessity or charity, necessary traveling and the service of any legal writ excepting in case of high treason or treason, felony, or breaches of the peace; and it permits also the sale of food in inns and eating-shops.

The American colonists, especially in their early New England settlements, enforced the observance of the first day of the week by the most rigorous penalties. People were compelled by the laws of Massachusetts, Connecticut, Georgia, South Carolina and Virginia to attend public worship in a church or conventicle. It was only as time advanced that a distinction was made between the observance of Sunday as a civil and as a religious institution. (See *SUNDAY*.) Consult: Hessey, 'Bampton Lectures' (1860); Oehler, 'Theology of the Old Testament'; Proudhon, 'La Célébration du Dimanche'; Briggs, 'The Higher Criticism of the Hexateuch' (1893).

**Sabbatia**, a genus of *Gentianaceae*, often growing in sand or salt marshes. These plants have verticillate leaves, handsome terminal flowers, with white or pink rotate corollas 5 to 12-merous; 4 to 12 stamens with thread-like filaments, and two-cleft styles, capsules more or less globose, coriaceous, and containing many small reticulated seeds. Several species have a tonic, although bitter, juice, and are used as febrifuges. Although named in honor of an early Italian botanist, Sabbati, the genus is said to be so called because the Pilgrim Fathers discovered the local *S. stellaris* on a Sabbath. This charming species, called the marsh pink, or Rose of Plymouth, bears a very delicate pink flower, with a star-shaped yellowish eye.

**Sabbat'ina**. See *JEWISH SACRA*.

**Sabbat'ical Year**, the seventh year which the law of Moses provided should be a year of rest for the land (Ex. xxiii. 10, 11; Lev. xxv. 1-7). The land was not to be sown and that which grew of its own accord was not to be reaped, but to be left for the poor to eat. Vineyards and oliveyards were also to be left uncultivated, and their produce ungathered; but the people were allowed to fish and hunt, and attend to their bees and flocks, and a triple produce was promised for every sixth year to make up for the deficiency of the seventh. The sabbatical year was also to be a year of release for Jewish debtors (Deut. xv. 1-6), but those who were able to lend were strictly enjoined not to refuse loans to poor and needy persons because the year of release was at hand (Deut. xv. 7-11). In this year also the law was to be read solemnly to all the people assembled at the feast of Tabernacles (Deut. xxxi. 10). This institution seems to have been almost entirely ignored during the period which preceded the captivity, and in 2 Chron. xxxvi. 21, the time of the captivity is represented as one in which the land was enabled, by the will of God, to enjoy the sabbaths or years of rest that the Israelites had omitted to allow it. After the captivity Nehemiah sought to secure the better observance of the septennial sabbath, as he did that of the weekly sabbath (Neh. x. 31), and he seems to have had some success in the former as well as in the latter effort. The historic fact that Alexander the Great remitted the Jewish tribute in the seventh year because the Jews were debarred by their religion from employing the means of raising it, shows that it was observed a hundred years after the time of Nehemiah.

**Sabellia**, a genus of annelids dwelling on sandy shores in tubes formed solely of sand, the

particles of which are glued together by means of a natural cement secreted by the worms, and thus form a smooth regular tube, presenting a striking contrast in its uniformity to the rougher dwelling-tubes of allied genera, such as *Terebella*. The worm itself possesses a slender body, the hinder part of which may be doubled up within the tube. The head is provided with slender tentacles.

**Sabellianism**, the theological views of Sabellius (q.v.), which, though they had numerous advocates, were condemned by the Church as heretical. See *MONARCHIANS*.

**Sabellius**, sa-bél'ŭ-s, Christian teacher: b. Pentapolis, Africa, or Italy. He taught at Ptolemais in Upper Egypt during the pontificate of Zephyrinus (199-217) and Calixtus I. (217-222), and is known as the founder of a sect who considered the Son and Holy Ghost only as different revelations or manifestations of the Godhead, but not as separate persons (see *MONARCHIANS*). The doctrines of Sabellius were opposed by Dionysius of Alexandria and Dionysius of Rome, by Epiphanius (who states that the Sabellians were very numerous around Rome and in Mesopotamia), and by Theodoret. Saint Augustine states that by the beginning of the 5th century they had entirely disappeared. Yet their views have always found adherents, and even now some theologians attempt to reconcile theology with reason by admitting conceptions of the Trinity coinciding with that of Sabellius.

**Sabians**. See *SABEANS*.

**Sabin**, sá'bĭn, Edwin Legrand, American writer: b. Rockford, Ill., 23 Dec. 1870. He was graduated from the University of Iowa in 1892, and has published: 'The Making of Iowa' (1900); 'The Magic Mashie' (1902); etc.

**Sabin**, Joseph, American bibliophile: b. Braunston, Northamptonshire, England, 9 Dec. 1821; d. Brooklyn, N. Y., 5 June 1881. After apprenticeship to Charles Richards, bookseller of Oxford, he set up a bookshop of his own there, but in 1848 came to this country, where he conducted establishments for the sale of old and rare works in New York 1850-6, in Philadelphia 1856-60, and New York 1860-81. His bibliographical knowledge was wide, and he is said to have crossed the Atlantic not less than 25 times for the purchase of unique specimens. From 1869 he published for a number of years 'The American Biblioplist.' He also prepared several compilations, among them 13 volumes of an uncompleted 'Dictionary of Books relating to America.'

**Sabin**, Oliver C., American Evangelical Christian Science bishop: b. Knox County, Ohio, 1840. His parents were members of the Christian Church, or Disciples of Christ. After the war he studied law and practised his profession for many years, was also engaged in journalism and publishing, and interested himself in politics. After being connected with business enterprises in Illinois, Nebraska, and elsewhere he settled in Washington, D. C., where, in 1899, after a thorough investigation of the Christian Science methods of healing, he with others organized the Evangelical Christian Science Church, the work of which has since prospered and spread rapidly. He relinquished his various business positions and began to

## SABINE--SABINE CROSS ROADS

preach the Gospel with voice and pen most successfully.

**Sabine**, sâ'bĭn, Sir Edward, English physicist: b. Dublin, Ireland, 14 Oct. 1788; d. Richmond, Surrey, 26 June 1883. He was educated at the military colleges of Marlow and Woolwich and in 1803 entered the army where he was commissioned 2d lieutenant of artillery. He served in the war with the United States in 1813-4 and accompanied Ross and Parry in their Arctic expedition in 1818 and that of Parry in 1819-20. While on these expeditions he engaged in researches in terrestrial magnetism and in 1821-5 conducted a series of voyages extending from the Arctic regions to the equator, gathering data concerning the magnetic needle, the figure of the earth and other points in meteorological and terrestrial physics. He was instrumental in the establishment of permanent magnetical and meteorological observatories, retaining directorship of those in the colonies for many years. In 1818 he was elected to the Royal Society, was its vice-president in 1850 and in 1861-71 acted as its president. He received rank as lieutenant-general in the army in 1859 and was retired with full rank as general in 1874. His works include: 'An Account of the Experiments to determine the Figure of the Earth' (1825); 'The Variability of the Intensity of Magnetism upon Many Parts of the Globe' (1838); etc.

**Sabine**, sâ'bĭn, Lorenzo, American historian: b. New Lisbon, N. H., 28 Feb. 1803; d. Boston, Mass., 14 April 1877. He sat in the New Hampshire legislature for three successive terms, but removed to Massachusetts in 1849, and was a Whig member of Congress in 1852-3. He is best known for his important work on 'The American Loyalists, or Biographical Sketches of Adherents to the British Crown in the War of the Revolution' (1847). He also published 'Life of Preble' (1847); 'Reports on the Principal Fisheries of the American Seas' (1853); 'Notes on Duels and Duelling, with a Preliminary Historical Essay' (1856); etc.

**Sabine**, sâ'bĭn, Mountains, Italy, a branch of the Apennines, near the border of ancient Latium, east of Rome, is a lofty group in the upper valley of the Aternus; the highest summit reaches an altitude of about 4,200 feet.

**Sabine**, sâ-bĕn', a river of the United States, which has its rise in the northeastern part of Texas, in Hunt County, flows southeast about 250 miles, then turns southward and forms the boundary between Texas and Louisiana, and enters the Gulf of Mexico through Sabine Lake and Sabine Pass. The mouth of the river is Sabine Pass, a narrow channel which is obstructed by a muddy bar. Considerable has been done to make this Pass safe for navigation; jetty-building and dredging was begun as soon as the interior of Texas, near the Sabine River, was settled. Sabine Lake is an expansion of the river, but the Neches River also enters the lake. The Sabine River is about 500 miles long and is navigable in its lower course.

**Sabine Cross Roads, Battle of, and Banks' Retreat to Alexandria.** Three miles southeast of Mansfield, De Soto Parish, La., one of the main roads from Alexandria to Shreveport is crossed by a road from Red River

to Sabine River. At this crossing was fought a battle which marked the culmination and failure of what is known as the Red River Expedition. On 23 Jan. 1864 Gen. Banks, then at New Orleans, received a despatch from Gen. Halleck, dated the 4th, proposing an expedition, to consist of the forces of Banks, Steele, and such as could be spared by Sherman, for the capture of Shreveport, La., on Red River, and the recovery of Texas, thus opening access to the cotton of that section and stimulating trade. Banks had, on a previous occasion, for sound reasons, objected to such a campaign, but now acquiesced and promised a cordial co-operation; but he set forth the difficulties in the way, and made suggestions to remove them, not one of which was regarded. Engrossed with duties concerning political affairs in Louisiana, which had specially been confided to him by the President, Banks could not immediately leave New Orleans, and he entrusted the arrangements of the expedition to Gen. W. B. Franklin, his second in command, who was to move from the Teche 5 March, reach Alexandria on the 17th, and co-operate with a strong fleet under command of Admiral Porter. Porter arrived at the mouth of Red River on 7 March, with a fleet of 15 ironclads and four light steamers, and there he was joined some days later by transports from Vicksburg, carrying four divisions of Sherman's army, under Gen. A. J. Smith, and the Marine brigade of Col. Ellet. A part of the plan of campaign was that Gen. Steele, with an army of 15,000 men, should move from Little Rock, Ark., directly on Shreveport; but Steele, after marching from Little Rock to Camden, was checked, fell back to Little Rock, and took no further part in the campaign. (See *JENKINS' FERRY, BATTLE OF*.) Smith's forces advanced, attacked and in conjunction with the navy, 14 March, captured Fort de Russy, up Red River, together with 283 prisoners, 10 guns, and many small arms, the Confederate covering force of 3,500 men, under Gen. Walker, after burning two steamboats and a considerable quantity of cotton, retreating up the river. It was not until the 19th that Franklin, with very little opposition, which was brushed aside by his cavalry, reached Alexandria; Banks joined him on the 24th, but his entire column did not close up until the 26th. Meanwhile Gen. Mower, with three brigades of Smith's division and a cavalry brigade of the Nineteenth corps, marched from Alexandria on the 21st for Henderson's Hill, 25 miles westward, surprised the 2d Louisiana cavalry, and with slight loss captured 250 men, nearly as many horses, and four guns, with their caissons. Near Alexandria the fleet came to a series of rapids, and the water was so low that the ironclads could not run up them, but after a week's hard labor the lighter ones were carried over. The transports, which could not pass, returned to Vicksburg, and with them Ellet's 3,000 men. The withdrawal of the transports made it necessary to establish a base at Alexandria and the use of a wagon-train to carry the supplies, and the further necessity of leaving a guard of nearly 4,000 men (under Gen. Grover) to protect the place. Gen. Franklin, with the main column, advanced on the road running west of and parallel to the river, to Natchitoches, about 80 miles above Alexandria, driving before him the Confederate cavalry, and reaching Natchitoches on 3 April, where he was

## SABINE CROSS ROADS

joined by A. J. Smith's column, which, accompanied by Porter's fleet, had come to Grand Ecore, four miles from Natchitoches. Porter had a fleet of 13 gunboats and 30 transports.

Banks' army, on the eve of march from Natchitoches for Shreveport, was composed of two divisions of the Thirteenth corps, under Gen. T. E. G. Ransom; five brigades of the Sixteenth corps, under Gen. A. J. Smith; Gen. W. H. Emory's division, three brigades, of the Nineteenth corps; and Col. Dickey's brigade of colored troops, under Gen. Franklin; Gen. A. L. Lee's division of cavalry and mounted infantry, four brigades, and a small artillery reserve, under Capt. Closson. These numbered 31 March 25,735 officers and men, with about 65 guns. Lee's cavalry force of 4,500 men had pushed out westward, 12 miles; on 2 April it ran across Confederate cavalry, drove it back eight miles, and then withdrew to wait for the general advance. The general advance began on the morning of the 6th, led by Lee's cavalry, followed by the two small divisions of the Thirteenth corps, under Ransom, and by Emory, with a division of the Nineteenth corps and Dickey's brigade of colored troops. On the morning of the 7th A. J. Smith followed with Mower's division of the Sixteenth corps. A division of the Seventeenth corps, 1,730 strong, under Gen. T. Kilby Smith, remained with the transports, under instructions to conduct them to Loggy Bayou, opposite Springfield, about midway between Natchitoches and Shreveport, 110 miles by the river, above Grand Ecore, where he was to halt and communicate with the army at Sabine Cross Roads, 54 miles from Grand Ecore. Porter, Smith, and the transports, with six gunboats carrying 17 guns, started on the 7th.

Lee's instructions from Gen. Franklin were to attack the enemy wherever found, but not to bring on a general engagement. On the 7th he drove a brigade of Gen. Green's beyond Pleasant Hill, and came upon a strong force under Green at Wilson's Farm. Lee attacked and after a hard engagement of two hours drove Green to Saint Patrice's Bayou, eight miles from Pleasant Hill. Here Lee bivouacked for the night, and sent back for infantry support. His loss had been 53 killed and wounded. Green's loss was greater, including about 100 prisoners. That night Franklin reached Pleasant Hill; A. J. Smith's division was still a day's march in rear of Franklin. At daybreak of the 8th Lee, having been reinforced by one of Landram's brigades of the Thirteenth corps, dropped his wagon-train, and, moving forward, drove the Confederates from Saint Patrice's Bayou and gradually pushed them to a wood beyond a clearing at Sabine Cross Roads, and found himself in the immediate front of Gen. R. Taylor's army of 10,000 men. Taylor, whose forces had been much scattered, in Arkansas, Louisiana, and Texas, had concentrated them, and near Mansfield had the three divisions of Gens. Green, Walker, and Mouton—10,000 men. On the morning of the 8th he moved three miles from Mansfield to Sabine Cross Roads and formed line in the edge of a wood, commanding, on both sides of the road, a clearing about 1,200 yards long, and 800 wide, through the middle of which was a deep ravine. He knew that Banks' column was stretched out on a single road for more than 20 miles, and was sanguine of success in

attacking the head of it. Lee threw out a strong skirmish-line and waited for Banks' main body to come up. At noon Ransom arrived with a brigade, and line was formed. Banks rode up a little past noon, and sent back repeated orders for Franklin to hurry forward. After heavy and continuous skirmishing, lasting until 4.30 p.m., Taylor threw his entire force of 10,000 men heavily upon the Union line; Mouton's division and two brigades of dismounted cavalry made an impetuous charge upon the Union right, in which Mouton was killed at the first onset, while Walker's division and a brigade on its right fell upon the centre and left of the line. For nearly an hour the men (not over 4,500) of Banks' command resisted this attack, and then were compelled to fall back to the woods in rear of the open space at the cross roads, with heavy loss, including three guns. Franklin had come up with Cameron's division of the Thirteenth corps, and a new line was formed, to be immediately broken by heavy attacks on both flanks and front. The Confederates were gaining the rear, and the Union line was pressed back along the narrow forest road filled with wagons and mules of the supply-train, stragglers, and camp-followers, which so blocked the way that an orderly retreat was impossible. Soon a panic set in, the cavalry team of 156 wagons was captured; Ransom's ten guns were taken, along with 1,000 of his men; Franklin and Ransom were wounded; some of the best officers were struck down; and in spite of the heroic efforts of Banks and others to rally them, nearly the whole army broke into a disorderly retreat, which was checked only at Pleasant Grove, three miles from the field of battle. Here Gen. Emory, with his division, had come up at 6 p.m., and formed line in the edge of a wood, on a ridge overlooking a small stream; and scarcely had his line been formed when the panic-stricken fugitives came rushing back through it to the rear. The Confederates were close on their heels, made an immediate assault upon Emory, and were met with a severe fire delivered at close quarters that instantly checked them. After an hour and a half of fierce battle, in which they made desperate efforts to turn Emory's right, the Confederates were everywhere repulsed with great loss, but held the shores of the stream. Banks' army, after having advanced to within two marches of Shreveport, had been saved from total destruction "by a triumph of valor and discipline on the part of a single division and of skill on the part of its intrepid commander." The action is known as the battle of Pleasant Grove. The Union loss at Sabine Cross Roads and Pleasant Grove was about 1,050 killed and wounded and nearly 1,800 missing; the Confederate loss, 1,500 killed and wounded.

Banks had been limited as to time in carrying out the objects of his campaign. Gen. Sherman was calling for A. J. Smith's troops, and Gen. Grant, who had set his heart on a movement by Banks from New Orleans on Mobile, had written him: "I had much rather that the Red River expedition had never been begun, than that you should be detained one day beyond the first day of May, in commencing the movement east of the Mississippi." The allotted time was fast expiring, and Banks concluded to abandon his expedition. The night of the 8th he fell back 15

## SABINE PASS

mies to Pleasant Hill, which was reached by Emory's division, that brought up the rear about 9 o'clock next morning. A. J. Smith, with a part of his command, had halted at Pleasant Hill, on the evening of the 8th, and with less than 13,000 men Banks formed a double line; the first, of the Nineteenth corps, along a thickly wooded slope half a mile west of Pleasant Hill; the second, of A. J. Smith's command and the artillery, on a plateau in rear. The trains, preceded by Lee's cavalry and Dickey's brigade of colored troops, and followed by the remnants of Ransom's division, were put on the road to Grand Ecore. Gen. Taylor, reinforced by the divisions of Gens. Churchill and Parsons, had followed Banks very cautiously, and at noon his advance appeared and began skirmishing. Later artillery was brought up and opened fire, and a demonstration was made on the Union right. About 5 p.m. three Confederate divisions charged out of the woods upon the left flank of the Union line, which was steadily driven back up the hill to the cover of the second line. Here the Confederates were repulsed with great loss. Meanwhile the right of the Union line, though hard pressed, stood firm until, the left being driven back, it was nearly enveloped and gave ground, and the Confederates pressed on to an attack on A. J. Smith, who held the second line in reserve. After a short and sharp exchange of fire, Smith's and part of Emory's men made a charge and pushed back the Confederate line. All the reserves were now thrown into action, and the Confederates were routed, driven from the field, and pursued until dark. Gen. E. Kirby Smith, the Confederate department commander, says: "Our troops attacked with vigor and at first with success, but, exposing their right flank, were finally repulsed and thrown into confusion. The Missouri and Arkansas troops, with a brigade of Walker's division, were broken and scattered. The enemy recovered cannon which we had captured the day before, and two of our pieces with the dead and wounded were left on the field. Our troops were completely paralyzed and disorganized by the repulse. . . . Our repulse at Pleasant Hill was so complete and our command was so disorganized that had Banks followed up his success vigorously he would have met but feeble opposition to his advance on Shreveport."

Banks had engaged at Pleasant Hill 12,600 men, of whom 150 were killed, 844 wounded, and 375 missing. Taylor had 14,300 engaged, of whom about 1,000 were killed and wounded, and nearly 500 missing.

Encouraged by his success at Pleasant Hill, Banks gave orders for a forward movement next morning on Shreveport, and preparations were being made for the march, when Gen. Franklin and other officers dissuaded him from it, and it was decided to fall back to Grand Ecore and unite with the fleet. The retreat was resumed during the night and Grand Ecore reached on the 11th. E. Kirby Smith joined Taylor after the close of the battle of Pleasant Hill, and determined to move against Gen. Steele in Arkansas. Taylor withdrew his infantry to Mansfield on the 10th and 11th, leaving the cavalry, under Green, and Polignac's infantry division of 2,000 men to watch and harass Banks. Upon his arrival at Grand Ecore Banks intrenched, threw a pontoon-bridge across the

river, put part of his force on the other side, and waited for the fleet to come down. Porter, with the gunboats, and Kilby Smith, with the transports, had arrived at Loggy Bayou on the afternoon of the 10th, where, two hours later, they received news of Banks' misfortune, and on the morning of the 11th received his orders to return to Grand Ecore. The fleet turned down stream, but it was not to reach Grand Ecore without opposition. On the evening of the 11th Green, who had been left at Pleasant Hill, started with 750 men and two batteries for Blair's Landing, and on the 12th, with about 500 men and three guns, attacked the fleet and transports as they were running down the river. A brisk fight followed, Gen. Green was killed by a discharge of grape from one of the gunboats, and his men were driven off, with small loss. The Union loss was 57 killed and wounded. By the 15th all the gunboats were back to Grand Ecore, and as fast as the vessels could pass the bar they made their way to Alexandria, one gunboat being lost. The fleet having passed down, Banks marched from Grand Ecore on the 2d for Alexandria, and that night bivouacked at Clouterville, 32 miles from Grand Ecore. The march was resumed on the 2d, and on the morning of the 23d, while marching along Cane River, a branch of the Red, the head of the column was checked at Monett's Ferry by Gen. Bee, with four brigades of 2,000 men and four batteries. Bee's position was a strong one on a bluff commanding the crossing, and on the only practicable road to Alexandria, 35 miles distant. At the same time the Confederate cavalry under Gen. Wharton and Polignac's infantry were harassing Banks' rear. Gen. Birge, with his own brigade and Cameron's division of the Thirteenth corps, in all about 5,000 men, crossed Cane River three miles above the ferry, and by a difficult flank march of several miles reached a hill, the occupation of which rendered Monett's Bluff untenable. Birge attacked at 2 p.m., after a contest of two hours carried the hill, and the Confederates retreated and left open the road Alexandria. The Union loss was 150 to 200 killed and wounded. Banks resumed his march on the 24th, and without further serious opposition entered Alexandria on the 25th. Banks reports that in the 24 days intervening between the march of the army from Alexandria and its return there his own army had marched 400 miles. He had fought several battles, and been successful in all but one, and his losses were 289 killed, 1,541 wounded, and 2,150 missing, an aggregate of 3,980. The difficulty of getting Porter's fleet over the shallow rapids near Alexandria detained Banks at that place until 13 May, when he continued his retreat. (See *YELLOW BAYOU, ENGAGEMENT AT, AND BANKS' RETREAT FROM ALEXANDRIA.*) Consult: 'Official Records,' Vol. XXXIV.; Taylor, 'Destruction and Reconstruction'; The Century Company's 'Battles and Leaders of the Civil War,' Vol. IV.

E. A. CARMAN.

**Sabine Pass, Engagement at.** On 6 Aug. 1863 Gen. Halleck informed Gen. Banks, in command at New Orleans, that there were important reasons why the United States flag should be restored at some point in Texas, with the least possible delay. Halleck's despatch was by direction of the Secretary of War, and it

## SABINES—SABLE ISLAND

was understood that the proposed movement was of diplomatic rather than a military character, and intended to prevent European complications. Banks was left to his own judgment to conduct the campaign, but it was suggested that the most feasible route would be by the Red River to Shreveport. Banks, deeming the Red River route impracticable at that season of the year, fitted out an expedition to make a lodgment in Texas at Sabine City, on Sabine Pass, the outlet from Sabine Lake into the Gulf of Mexico, and the terminus of a railroad penetrating eastern Texas, and making connection with Houston, the capital of the State. Gen. Franklin was put in charge of the advance of the expedition of 5,000 men, and was instructed to land a few miles below Sabine Pass, move upon the Confederate works commanding it, and, if practicable, to seize Beaumont, on the railroad to Houston. Four light-draft gunboats, under command of Lieut. Crocker, formed part of the expedition, which sailed from New Orleans on 4 September. Franklin disregarded his instructions to land 10 or 12 miles below Sabine Pass, and on Crocker's representation that he could silence the Confederate works in the pass, he and Crocker arranged for the gunboats to make a direct attack upon the works, drive out the garrison, seize or drive away two Confederate gunboats reported on the river, and then land the troops. From the army 150 sharpshooters were distributed on the four gunboats. Early in the forenoon of the 8th the gunboats and transports crossed the bar at Sabine Pass, and in the middle of the afternoon three of the gunboats opened fire upon the small fort, mounting eight heavy guns, and held by 44 officers and men. The fire was immediately returned, two of the gunboats were disabled and surrendered, and were taken in tow by two small Confederate craft. It was all over in less than an hour. Franklin made no serious attempt to land his troops, but immediately returned to New Orleans, having lost two gunboats, with their 15 heavy guns, nearly 50 killed and wounded, and over 200 prisoners, among them Lieut. Crocker, of the navy. Not a Confederate was hurt. Consult 'Official Records,' Vol. XXVI.

E. A. CARMAN.

**Sabines**, sá'bīnz (Latin, SABINI, sá-bīnī), a people noted in the early history of Rome, whose territory they adjoined. As a people the Sabines were engaged in agriculture and grazing, and from the simplicity of their lives and their physical prowess they obtained a reputation like that of the Spartans for severity of discipline and sturdiness of character. The narrow limits of the Sabine territory made emigration necessary, and probably in this way they came in contact with the growing power of Rome. They fought the Romans with great courage, but were subdued about 290 a.c., and admitted to Roman citizenship, but not permitted to vote in civic affairs. They became merged in the republic and subsequent empire, and became lost to view as a separate people.

**Sabinus**, Masurius, Roman jurist. He flourished during the reign of Tiberius, and was a pupil of Capito. He was the founder of the school of Sabiniani, and was the author of several works much used and commented upon by

later jurists, the most important being 'Libri iii. Juris Civilis,' which is not now extant.

**Sable**, one of the fur-bearing animals (*Mustela mellea*), found in Siberia, Asiatic Russia and Kamchatka, or its American representative (*M. americana*) which differs so little that it is doubtfully named as a separate species. The average length of the sable is about 18 inches, excluding the tail, which is somewhat bushy. The body partakes of the form of the weasels generally, in that it is elongated and vermiform. The fur is smooth, glossy, and may be pressed or smoothed in any direction, owing to the mode of attachment of the hairs to the skin. In color it is a rich deep brown, which near the head may exhibit white markings, and frequently assumes a gray tint about the neck. The fur is heaviest during winter, and the dangers experienced by the sable-hunters from sudden snow-storms obliterating the track, or from the inclement cold, can hardly be overestimated. Sables are for the most part captured in traps, but are cautious animals, and their pursuit is attended with much difficulty. They make their homes in dens or cavities in hollow trees, and produce from three to five young at a birth, the young being born in March or April; and their general habits are those of the marten and weasel, but they are more shy and retiring.

Skins of the Russian sable fetch prices in Liverpool ranging from three to ten guineas. The darkest skins are considered to be the finest. About 2,000 skins annually find their way to England. Most of these furs are used in Russia, where about 25,000 are said to be annually collected. When manufactured for linings sable furs may fetch prices so high as 1,000 guineas. The corporation robes of the London aldermen are lined with this expensive material, and the tails of sables are used in the manufacture of artists' brushes. See FUR-BEARING ANIMALS; FUR-TRADE.

**Sable Antelope**, one of the largest and most handsome of African antelopes (*Hippotragus niger*), of the same genus as the roan antelope, blaubok, and others, and like them rapidly approaching extinction, as civilization more and more encroaches upon the plains of southern and eastern Africa. Its coat is a deep glossy black, markings upon the face, the buttock and the under parts being white. The great-ringed horns sweep back from the forehead in a sabre-like curve, and the neck is adorned with a mane. These antelopes went about, in old times, in herds, and were prizes for the sportsmen, while their flesh was excellent to eat. Extensive descriptions may be found in the writings of Gordon-Cumming, Anderson, Baker, Selous, Bryden, and other African sportsmen-travelers.

**Sable, Cape.** See CAPE SABLE.

**Sable Island**, a low-lying island in the Atlantic, in lat. 44° N. and lon. 60° W., 85 miles east of Nova Scotia. It is a chain of sand-dunes enclosing a lagoon, and is such a menace to navigation that the government of Canada maintains two lighthouses here. It was formerly 40 miles long and is now but 20, gradually sinking. Upon its sandy ridges grow cranberries and wild grass, and attempts are being made to grow pines and other hardy ever-

## SABOTS—SACCHAROMETER

greens. There are sandbanks in the vicinity. The only inhabitants are the lighthouse and lifeboat men attached to the establishment for the relief of shipwrecked persons. The island is known for its breed of hardy wild ponies.

**Sabots**, sā-bōz', shoes for women largely worn by the peasantry of France, Belgium, Holland, and some other parts of Europe. They are especially useful in wet weather, and in moist places generally, being well adapted to preserve the feet from damp. Great numbers of sabots are exported by France to Belgium. In some parts of England, as in Lancashire, shoes with thick wooden soles, but with leather vamps or "uppers," are worn by most of the artisan class. See **BOOTS AND SHOES**.

**Sabre-Tache**, sā-br-tāsh, a leathern case or pocket worn by cavalry officers at the left side, suspended by three straps from their sword-belt. It came into use when the jackets of cavalry soldiers were too short or too tight to admit of pockets being made in them, but is now rather ornamental than useful.

**Sabre-toothed Tigers**, extinct cats of the family *Macharodontidae* (or *Nimravidae*), a group whose remains occur as fossils from the Eocene up to the Pleistocene. They differ from ordinary cats (*Felidae*) in several anatomical features, having some peculiarities which ally them to the bears, and others recalling existing viverrids, as the fousa (*Cryptoprocta*). They are remarkable for the character of the dentition, which in the earlier genera comes near showing the complete number of teeth, but displays a steady tendency as the family history is followed toward the reduced number possessed by existing cats. At the same time the dentition is often distinguished by the huge size of the upper canines, which in some cases were five or six times as long as the neighboring teeth, and have been justly called "sabre-teeth." These tushes reached their highest development in the genus *Macharodus*, whose species were of very wide distribution, occurring in both North and South America and in Europe. These carnivores were of various sizes, up to dimensions equal to those of modern tigers, and so little different in general from true cats that Cope places them within the *Felidae*. It began in the Eocene and continued down almost or quite to the Glacial Period, when the type seems to have become extinct because the great canines had overgrown usefulness and become a hindrance instead of a help in getting a living. They finally became so large that the animal could not open its mouth wide enough to make use of them in biting, and the space between them would admit none but a very small piece of meat to enter, even if a large piece could be torn away. "Even when the mouth opens so far as to allow the mandible to pass behind the apices of the canines," remarks Cope, "there would appear to be some risk of the latter being caught on the point of one or the other canine, and forced to remain open, causing early starvation." Other prominent genera in the family are the plantigrade *Dimictis* (q.v.); *Nimravus* and *Pogonodon*, with species as large as panthers; and *Hoplophoneus*, with dentition like modern cats. Consult Flower and Lydekker, 'Mammals, Living and Extinct' (1891); Cope, 'Vertebrates of the Tertiary Formation of the West,' Rept.

U. S. Geol. Survey, Vol. III. (Washington, 1884); Woodward, 'Vertebrate Paleontology' (1898).

**Sac** (sāk) City, Iowa, county-seat of Sac County; on the North Fork of the Raccoon River, and on the Chicago, M. & St. P. and the Chicago & N. W. R.R.'s; about 42 miles west by south of Fort Dodge. It is in an agricultural region where considerable attention is given to raising live stock. The chief manufacturing industries are connected with farm products. The trade is chiefly in farm and dairy products, flour, and agricultural implements. The educational institutions are the Sac City Institute (Baptist), a high school, public elementary schools, and a public library. Pop. (1890) 1,249; (1900) 2,079; (1910) 2,201.

**Sac Fungl.** See **FUNGI**.

**Sac-à-Lait**, sāk'-ā-lā, a fish. See **CRAPPIE**.

**Sacbut**, or **Sackbut**, the word by which translators have rendered the *sabbeka* of the Hebrew Scriptures. The exact form of the sabbeka has been much disputed, but that it was a stringed instrument is certain, for the name passed over into Greek and Latin in the forms *sambuke*, *sambuca*, and the instrument so called is described by Athenæus as a harplike instrument of four or more strings, and of a triangular form. It is not unlikely that this instrument was introduced among the Jews from the East, since one of the musical instruments most frequently occurring in the Assyrian sculptures answers very closely to this description, and may perhaps be identified with the sabbeka, the name of which is, besides, Chaldaic. Nothing resembling this Assyrian instrument is to be found on the Egyptian monuments or in the sculptures of Greece and Rome. Since the sabbeka was a stringed instrument the rendering sacbut is altogether wrong, since that was, at the time when our translation of the Scriptures was made, the name of a wind-instrument now called the trombone. See **TROMBONE**.

**Sac'caton Grass.** See **GRASSES OF THE UNITED STATES**.

**Saccharin**, sāk'-ā-rin,  $C_6H_4\langle\begin{smallmatrix} CO \\ SO_2 \end{smallmatrix}\rangle NH$ , benzoic-sulphinid, a sweet substance discovered by Remsen and Fahlberg in 1879. It is prepared from toluene by a series of chemical processes. White crystals soluble in hot water, alcohol, and ether. Its characteristic and most valuable property is its intense sweet taste, being about 550 times sweeter than cane-sugar so that a solution of one part in ten thousand parts of water has a perceptible taste. It has an extensive use as a sweetening agent in the manufacture of various beverages, preserves, jellies, etc., and may be used by diabetic patients who cannot use sugar. It has not, however, the food value of cane-sugar.

Saccharine forms salts with bases, the sodium salt being frequently used in place of saccharin because of its greater solubility.

**Saccharometer**, or **Saccharimeter**, any instrument used to determine the strength of a sugar solution. One common form is a hydrometer with the stem so graduated as to read per cents of sugar content in solution examined. Another is a form of polariscope devised

by Mitscherlich with the scale on which the angle of deviation of the plane of polarized light is read so graduated as to show the percentage of sugar in the solution used.

**Saccopharynx**, a genus of *Muraenidae*, with a single species (*S. flagellum*), a deep-sea conger eel, of which only three specimens have been observed: muscular system very feebly developed; bones thin and soft, wanting in organic matter; head and gape enormous; stomach distensible in an extraordinary degree, vent at end of trunk. The specimens known have been found floating on the surface of the North Atlantic with their stomachs much distended, having swallowed some other fish many times their own weight. They attain a length of several feet. See DEEP SEA EXPLORATION.

**Sacheverell**, al-shév'è-rèl, Henry, English Anglican divine: b. Wiltshire about 1674; d. London 5 June 1724. He was educated at Oxford and in 1705 was appointed preacher of Saint Saviour's, Southwark. While in this station he, in 1709, preached two famous sermons, the object of which was to rouse apprehensions for the safety of the Church, and to excite hostility against the Dissenters. Being impeached in the House of Commons he was brought to trial in February 1710, and on 23 March, when the trial was concluded, was suspended from preaching for three years. This prosecution, however, excited such a spirit in the High Church party that it helped to overthrow the ministry of Godolphin, and established the fortune of Sacheverell, who, during his suspension, made a kind of triumphal progress through the kingdom. The same month that his suspension terminated (1713) he was appointed to the valuable rectory of Saint Andrew's, Holborn, by Queen Anne. Of the offending sermons 40,000 copies at least were sold, and of the record of the trial 30,000. Little was heard of Sacheverell after this party ebullition subsided, except through his numerous squabbles with his parishioners. His abilities, even according to writers on his own side, were very slight. Consult Stanhope, 'History of Queen Anne's Reign' (1879).

**Sachs**, sàks, Bernard, American neurologist: b. Baltimore, Md., 2 June 1868. He was graduated from the University of Strasburg, Germany, in 1892, and engaged as a medical practitioner in New York. He has made a specialty of the study of nervous diseases, regarding which he is a recognized authority. Besides numerous medical monographs he has published 'Mental and Nervous Diseases of Children' (1894).

**Sachs**, Edwin O., English architect: b. London 5 April 1870. He was educated at University College School, London, and at the University of Berlin, and engaged as an architect in London in 1892. He has established a wide practice in connection with theatres and public buildings and in 1898 applied electrical power to the working of the stage for the first time in England. He founded the British Fire Prevention Committee in 1897 and organized the first International Fire Prevention Congress in London in 1903. He has published: 'Modern Opera Houses and Theatres' (3 vols., 1896-8); 'Facts on Fire Prevention' (1908); 'Stage Con-

struction' (1898); 'Fires and Public Entertainments' (1897).

**Sachs**, Hans, hants sàks, German master-singer: b. Nuremberg 5 Nov. 1494; d. there 20 Jan. 1576. He was by trade a shoemaker, and followed his business and made verses with equal assiduity. From 1510 to 1515 he traveled over different parts of Germany, practising his craft, according to the custom of German workmen, in all the towns he visited. In the latter year he returned to his native town, where he was admitted as master in his guild. He early attached himself to the Reformation movement, to the spread of which among the *bourgeois* he contributed not a little by a poem written in 1523, 'Die Wittenbergisch Nachtigall, die man jetzt höret überall,' in which he hailed with approval the cause of Luther. In 1544 he was with the army of Charles V. in France. The productions of Hans Sachs are extremely numerous. In 1536 he estimated the number of his poems at 5,000 or more. Three volumes of his poems were published during his lifetime, and two more after his death. In the 17th century, after the introduction of a more artificial style into German poetry, Hans Sachs fell into neglect, from which he was not withdrawn till Goethe, who had become acquainted with him in his studies for 'Faust,' drew attention to his merit in a poem (Erklärung eines alten Holzschnitts vorstellend Hans Sachsens Poetische Sendung) which appeared in the 'Deutscher Merkur' (April 1776). The best edition of his works is that of Keller and Goetze, and the best selection that of Gödeke and Tittmann in 'Deutsche Dichter des sechzehnten Jahrhunderts' (2d ed., 1883-5). He possessed a fruitful genius, and, notwithstanding the rudeness of his language, his poems are distinguished for *naïveté*, feeling, invention, wit, and striking description. Consult: Schweitzer's 'Etude' (1889); Goetze's 'Hans Sachs' (1894); Genée's 'Hans Sachs und seine Zeit' (1893); and Drescher, 'Studien zu Hans Sachs' (1891).

**Sachs**, Julius, German botanist: b. Breslau 2 Oct. 1832; d. Würzburg 29 May 1897. He studied at Prague where he became assistant in botany, and in 1867 became professor of botany at Freiburg. The following year he removed to Würzburg, where in his own laboratory he made extremely important experiments in the physiology of plants. He published 'Handbuch der Experimental-Physiologie der Pflanzen' (1865); 'Lehrbuch der Botanik' (1868-74); 'Vorlesungen über Pflanzenphysiologie' (1882-7); 'Geschichte der Botanik vom 16. Jahrh. bis 1860' (1875); 'Gesammelte Abhandlungen über Pflanzenphysiologie' (1892-3).

**Sachsen**, sàks, Julius Friedrich, American author: b. Philadelphia, Pa., 23 Nov. 1842. He engaged in journalism and has written extensively, his publications including: 'The German Pietists of Provincial Pennsylvania, 1694-1708'; 'Horologium Achat-Christophorus Schissler, Artifex'; 'Justus Falckner, Mystic and Scholar' (1903); 'Pennsylvania: the German Influence in its Settlement and Development'; 'The German Separatists of Pennsylvania, 1708-1743.'

**Sachsenhausen**, sàk'sèn - how - zèn. See FRANKFORT-ON-THAINE.

**Sachsenspiegel**, *sák'sén-spé'gēl*, a private collection of legal precepts and legal customs which had the force of law in the Middle Ages in Germany, especially in the north of Germany. One of the six prefaces to the collection mentions one Eyke von Repgow as its author, and this account is generally accepted as true. Its date is supposed to be earlier than 1235. The study of it has been revived in Germany. The best edition is by Homeyer (Berlin, 1835-44).

**Sack**, a general name for the different sorts of dry wine, more especially the Spanish, which were first extensively used in England in the 16th century.

**Sackbut**. See **SACBUT**.

**Sacketts** (*sák'ts*) Harbor, N. Y., village, in Jefferson County; on Black River Bay, the inlet through which Black River discharges its waters into Lake Ontario; and on the Rome & Watertown railroad, which is a branch of the New York Central & Hudson River railroad. The village is about 10 miles from Watertown, eight miles from Lake Ontario, and 170 miles west-northwest of Albany. It has a good harbor, large enough to accommodate vessels of the largest size, and it has steamer connections with several of the lake ports. Sacketts Harbor is one of the oldest places on the northern frontier; in 1809, the Oneida, the first United States war vessel, was built here. In the War of 1812 the village was the scene of several engagements, and was an important United States naval station. The frigates *Madison* and *Superior*, war vessels, were made here in 40 and 80 days respectively, from the time the timber was cut. A third warship was nearly completed when peace was restored; the hull remained in the yard for a number of years. The United States military station, *Madison Barracks*, is located here. Sacketts Harbor is in an agricultural region, and although it has good water power, there is but little manufacturing. Pop., exclusive of garrison (1910) 868.

**Sackville**, *sák'vīl*, **Charles**, 6TH EARL OF DORSET, English courtier and poet: b. 24 Jan. 1637; d. Bath 29 Jan. 1706. He became a wit and roisterer, in the company of Charles II., served under the Duke of York in the sea fight with the Dutch in 1663 and is said to have written or retouched on the night before the engagement of 3 June his famous song, "To all you ladies now on land." He succeeded to his title in 1677, but did not stand well in the favor of James II., and later became an ardent supporter of William of Orange, under whom he was lord chamberlain of the household from 1689 to 1697, and three times one of the regents during the king's absence. He was a patron of poets like Prior and Wycherley, and Dryden dedicated to him the "Essay on Satire."

**Sackville**, **Lionel Sackville Sackville-West**, BARON, English diplomatist: b. Cambridgeshire 19 July 1827; d. Knole Park, Sevenoaks, Eng., 3 Sept. 1908. After a private education, he entered the diplomatic service in 1847, was made secretary of legation at Turin (1858), Madrid (1864); Berlin (1867), and Paris (1868), and was envoy extraordinary and minister plenipotentiary successively to the Argentine Confederation (1872-8) and to Spain

(1878-81). In 1881 he was appointed minister to the United States, and in 1888 with Joseph Chamberlain and Sir Charles Tupper negotiated the fisheries treaty of that year. In October 1888 he received a letter from one C. F. Murchison, who, representing himself as an Englishman naturalized in the United States, asked for which party he should vote in the ensuing Presidential election. The minister in reply advised his correspondent to vote the Democratic ticket as favorable to English interests. The Murchison letter was generally regarded as a trap set for the embarrassment of the minister. His recall was at once asked for, and in default of a prompt compliance with the request the Department of State sent him his passports 30 October. The incident, occurring as it did during a Presidential canvass, was the subject of much discussion. He died 3 Sept. 1908.

**Sackville**, **Thomas**, EARL OF DORSET and BARON BUCKHURST, English statesman and poet: b. Withyham parish, Sussex, 1536; d. London 19 April 1608. He was a member of the University of Oxford, but removed to Cambridge, and afterward became a student of the Inner Temple. At both universities he was distinguished for his performances in Latin and English poetry, and in the Temple wrote the last two acts of the tragedy of 'Gorboduc, or Ferrex and Porrex' (1565). Of a poem intended to comprehend a view of the illustrious but unfortunate characters in English history, entitled the 'Mirror for Magistrates,' he finished only a poetical preface (the 'Induction') and one legend on the life of the Duke of Buckingham. The work was completed by George Ferrers and Richard Baldwin (1559-63). He sat in the Parliament assembling 20 Jan. 1558, and in the first two Parliaments of Elizabeth (1559-63) after which he traveled. In 1586 he was made a member of the court appointed by Elizabeth to try Mary Queen of Scots. In 1598 he was joined with Burleigh in negotiations for peace with Spain, and renewed a treaty with the United Provinces. On the death of Burleigh, he became lord high treasurer. In January 1601 he was appointed lord high steward, and presided at the trial of the Earl of Essex. On the accession of James I. his post of treasurer was confirmed to him, and in 1604 he was created Earl of Dorset. He ranks among the most prudent and able of the ministers of Elizabeth, was a good speaker and a still better writer. The tragedy of 'Gorboduc,' the subject of which is a sanguinary story from early British history, is the first example in English of regular tragedy in blank verse. Sackville's share is inferior in literary value to his 'Induction,' called by Sidney Lee the greatest English poem between the 'Canterbury Tales' and the 'Faerie Queene.'

**Saco**, **José Antonio**, *hó-ás' in-tó'ná-ó sák'ó*, Cuban historian and publicist: b. Bayamo, Cuba, 7 May 1797; d. Madrid, Spain, 26 Sept. 1879. He was educated in Havana and in 1821 was appointed professor of philosophy in the Seminary of San Carlos. In 1832-4 he lived in Havana and edited the 'Revista Bimestre Cubana,' but his liberal and anti-slavery principles caused his banishment, though he was afterward allowed to return. He traveled in Europe and in 1840 settled in Paris where he resided for many years. He was elected a dele-

## SACO — SACRAMENTO

gate to Madrid in 1866 to advocate political reforms for Cuba and in 1878 was elected to the Spanish cortes. He wrote: 'Paralelo entre Cuba y algunas colonias inglesas' (1838); 'Supresión del tráfico de esclavos en Cuba' (1845); 'Ideas sobre la incorporación de Cuba á los E. U.' (1848); 'Historia de la esclavitud desde dos tiempos mas remotos' (1876 et seq.); etc.

**Saco, sá'kō**, Maine, city in York County; on the Saco River, and on the Boston & Maine railroad, about 15 miles west-southwest of Portland and four miles from the ocean. Four bridges span the river connecting the city with Biddeford and other localities. A fall in the river of about 40 feet furnishes extensive water-power. The tide-water extends to the falls. The chief manufacturing establishments are cotton mills, boot and shoe factories, lumber mills, manufactories of belting, brushes, and cotton-mill machinery. The city has an extensive coast trade in cotton goods and other manufactures, and it ships considerable farm products. Old Orchard, a popular seaside resort, is in the vicinity. The principal public institutions are Thornton Academy; York Institute, founded in 1866; a public high school and elementary schools, two libraries, one home for the aged, several fine churches, and a number of good business blocks. Pop. (1890) 6,075; (1900) 6,122; (1910) 6,583.

**Saco**, a river which has its rise in the White Mountains in New Hampshire, and flows southeast through New Hampshire and Maine, and enters the Atlantic Ocean. It is about 165 miles long and drains an area of 1,750 square miles. It is a swiftly flowing stream having a number of rapids and falls, which furnish abundant water-power for manufacturing. Great Falls is 72 feet high.

**Sacramentarians**, a religious term which at present is applied almost solely to members of the Protestant Episcopal Church in America, and the Anglican Church in England and elsewhere, who sustain a "high" view of the efficacy of the sacraments. In past ecclesiastical history it has had a wholly different meaning, and was applied to those Reformers who refused to agree to Luther's doctrine of the real presence of the body and blood of Christ in the bread and wine. The Sacramentarian party were the authors of the Tetrapolitan Confession, so called from the four cities of Strasburg, Constance, Lindau, and Memmingen, which supported the Sacramentarian doctrines. This confession excluded all idea of a physical presence of Christ's body. The Swiss reformer Zwingli took a similar position on the question of Christ's presence in the Eucharist, and an article prepared by him declaring against the real presence was embodied in the confession of the Helvetic Church. The German Sacramentarians joined the general body of Protestants in resisting Charles V., and became merged with the Lutherans.

**Sacramento, Cal.**, city, port of entry, county-seat of Sacramento County, and capital of the State, on the Sacramento River, and on the Southern P. and Central P. R.R.'s; 90 miles northeast of San Francisco. The city is situated in lat. 38° 35' N., and lon. 121° 20' W.; and is built on a broad, low plain, 30 feet above sea level. The streets are wide and straight and

cross each other at right angles. Shade trees are abundant. The shops and stores are built of brick and the dwellings mostly of wood. The city is noted for its beauty of environment, is the centre of an extensive agricultural and horticultural section; and has a warm, almost semi-tropical climate.

**Public Buildings.**—The State capitol building, completed in 1869, at a cost of \$2,500,000, stands in a plaza covering 30 acres. There is a United States government building here, the Crocker Art Gallery, building of the Foresters, Odd Fellows, and Masons, and Fort Sutter (re-built). California State Bank, Sacramento Institute, College of the Christian Brothers; California State Library (113,000 volumes), Public Library (28,000 volumes), Howe's Academy, Saint Joseph's Academy, City Dispensary, Railroad Hospital, and numerous churches, schools, and charitable institutions. The city has three daily newspapers and numerous weekly and monthly periodicals.

**Manufactures.**—Sacramento is the second manufacturing city in California, and has a variety of industries, including flouring and grist mills, foundries and machine shops, lumber mills, breweries, manufactories for saddlery, harness, furniture, carriage, soap, and crackers. The repair shops of the Southern-Pacific railroad are located here, giving employment to 3,000 men. The industries of Sacramento represent a capital invested of \$7,300,013, with an annual output valued at \$11,141,896. The city exports immense quantities of flour and grist mill products, to China, Japan, and Australia.

**Government.**—The city is governed by a mayor and city council elected every two years by a popular vote. There are well equipped fire and police departments. The waterworks are owned and operated by the municipality. The assessed property valuation of the city is about \$18,000,000. The streets are lighted by electricity. An annual State fair is held here, and an exhibition building, park, and race course are maintained by the State Agricultural Society.

**History.**—The first white settlement on the site of Sacramento City was made in 1839, by Captain John A. Sutter, a Swiss by birth, but a naturalized American citizen, who obtained a grant of 11 square leagues of land from the Mexican government. In 1841 Captain Sutter built a fort which he called New Helvetia. He took many of the neighboring Indians into his service, collected a few white trappers, and by virtue of his isolated position and the number of his adherents, secured influence and importance in the territory. Sutter's Fort, as it was popularly called, was the first point in California settled by immigrants crossing the continent; with the increase of the population the trade and importance of New Helvetia kept apace, and in October 1848 there was an auction sale of lots in the town of "Sacramento," which was first named in the advertisement of the sale. In January 1849 the first frame house was built on the banks of the Sacramento River, and here the settlement was moved from the fort. The site of the town was originally only about 15 feet above low-water mark, and as the river frequently rose to 20 feet, the town was subjected to overflows. In January 1850, in March 1852, and again in January 1853, the city was flooded so

## SACRAMENTO — SACRAMENTS

that boats were used in going from house to house; after this the lower streets were raised five feet, and a levee was built which saved the city from subsequent floods. On 3 Nov. 1852 a conflagration destroyed 600 houses and other property, entailing a loss of \$5,000,000. In July 1854 another fire destroyed property valued at \$650,000. The State capital was established here by an act of the Legislature on 25 Feb. 1854, but not until 1861 was a capitol building erected. On 3 Feb. 1856, the first railroad was opened between Sacramento and Folsom. In the gold days of 1849-50 Sacramento was the great mart of the mines, the base of supplies and the metropolitan centre of various mining camps. Steamers ran daily to San Francisco and up the river to Red Bluff. The California Stage Company with a capitalization of \$1,000,000 ran daily stages to Maryville, Nevada, Downieville, Stockton, Jackson, Mokelumne Hill, and other leading towns in the mining district. The city was first incorporated as a town in 1849, and was chartered as a city in 1863.

**Population.**—Sacramento in 1860 had a population of 13,788; (1880) 21,420; (1890) 26,386; (1900) 29,282; (1910) 44,606.

H. WEINSTOCK,  
of Weinstock, Lubin & Co.

**Sacramento**, a river in California which rises in the northern part of the State, flows south in the valley between the Sierra Nevada and the Coast Range, and uniting with the San Joaquin River (q.v.), both break through the Coast Range, and enter the Suisun Bay, from which the waters pass through a strait into the Bay of San Pablo, and to the Pacific through San Francisco Bay and the Golden Gate. The chief tributaries are the Pitt River, from the northeastern part of the State, and Feather River, which enters the Sacramento about 15 miles above the city of Sacramento. The Sacramento is about 400 miles long, from the source of the Pitt to the mouth of the Sacramento is about 600 miles. The river is navigable for about 270 miles from its mouth, and the Feather River for about 30 miles from the Sacramento. The debris from placer mining has been a hindrance to navigation; large sums have been expended to improve navigation. The Sacramento Valley is a fertile region, in which are raised large quantities of grain and fruits.

**Sacramento Salmon**, Perch, Pike, etc., local names in California for various fishes caught in the Sacramento River, and more or less widely elsewhere. The salmon is the quinnat (q.v.). The Sacramento sturgeon is the white sturgeon (see *Sturgeon*). The Sacramento perch is a fish (*Archoplis interruptus*) closely related to the eastern rock-bass (see *Bass*). It reaches from one to two feet in length, is blackish above, sides silvery, with about seven vertical blackish bars, more or less interrupted. It is an excellent food-fish. The Sacramento pike is a big minnow (see *Squawfish*). The sucker is a species (*Catostomus occidentalis*) formerly of great importance to the Indian population, but little esteemed in civilized markets.

**Sacraments.** The Latin word *Sacramentum* was in the classical period a judicial and military technical term. The underlying concept seems to be consecration to a divinity,

something set apart for that purpose as sacred and inviolable. Thus the term was applied in jurisprudence to the specified sum of money deposited with the judicial authorities by the parties to a suit, and was so designated either because the place of deposit was sacred, or because the sum forfeited by the losing party was used for religious purposes. In military parlance the word signified originally the preliminary engagement entered into by newly enlisted recruits, and afterward the military oath of allegiance which became obligatory after the second Punic war (Liv. xxii. 38). Later on the term was used to designate any oath or solemn engagement whatever.

Among ecclesiastical writers the word has had various significations. In earlier usage, represented for instance, by the ancient Latin version of the Scriptures, and maintained even in many passages of the Vulgate (for example, Eph. v. 32, Rev. i. 20, etc.) it was a synonym of *arcansum*, and corresponded in sense to the Greek word *μυστήριον*, the notion embodied being that of something secret or mysterious, whence also, by extension, it came to denote the sign or symbol whereby hidden things were signified, especially in matters referring to religion. Thus Augustine says: "Symbols when pertaining to things divine are called sacraments." As certain religious rites of paganism were called mysteries on account of their occult signification known only to the initiated, the equivalent word "sacrament" was naturally adopted by the early Christians to designate their own religious rites and ceremonies, and was used at first more or less indiscriminately with reference to any or all of them. There seems to have been no attempt on the part of early Christian writers to define the sacraments accurately or enumerate them. Thus they speak vaguely now of two, now of more sacraments, at times even restricting the term to the Eucharist as the sacrament, and opposing it to Baptism. Nor do we find in their writings any definition of a sacrament more explicit than the rather general notion formulated by Augustine, "a sign of something sacred." In the literary treatment of this as well as other doctrinal topics analytic precision and systematic classification came gradually with the development of theological thought.

Roman Catholic theologians of the mediæval and subsequent periods understand by sacraments in the strict specific sense of the word, a definite category of sacred rites or symbols of divine institution, and which in virtue of this institution have the power of conferring instrumentally the grace or sanctity which they symbolically represent. Of these a certain number are allowed to have belonged to the Old Dispensation, being typical of the sacraments of the New Law, but the intrinsic efficiency attributed to them is limited (with however certain reserves in favor of the rite of circumcision taken to be the Old Testament type of Christian baptism) to the bestowal, not of internal, but external sanctity, that is, legal purifications, etc. With regard to the sacraments of the New Law, Roman Catholic theologians hold that they are seven in number instituted by Christ (namely, Baptism, Confirmation, Eucharist, Penance, Extreme Unction, Holy

## SACRAMENTS.

Orders, and Matrimony), and this enumeration, together with the main points of doctrine concerning the sacraments collectively and individually has been fixed by the dogmatic definitions of the Council of Trent.

The Reformers of the 16th century who professed to retain only such beliefs as were clearly demonstrable from Scripture, rejected the doctrine of the seven sacraments, but did not at once agree as to the number to be admitted, some recognizing besides Baptism and the Eucharist, Confirmation, Penance and Orders, while others rejected one or the other or all of these last. As regards the present status of opinion, if we except the High Church section of the Anglican communion, Protestant denominations as a rule, recognize only two sacraments: Baptism and the Eucharist.

That the existence of seven sacraments instituted by Christ cannot be proved from the New Testament alone must, of course, be granted, even by Roman Catholic theologians, but they claim that such proof is not necessary, since according to the fundamental Catholic contention, the New Testament writings do not furnish a complete record of Christ's actions—they are not, unless supplemented by tradition and the voice of the living Church, an adequate criterion of Christian belief and practice. They contend, moreover, that if the Scripture alone is to be held as decisive in the matter, consistency would require that the ceremony of the washing of the feet (John xiii.) be counted among the sacraments, since it seems to fulfil all the requisite conditions. (Sc. permanent divine institution, v. 4 seqq. cf. 12-18. Signification and production of grace, v. 8.)

Be that as it may, it must furthermore be conceded in connection with the appeal to tradition, that no positive proof of the recognition in the early church of seven sacraments neither less nor more, can be gathered from the writings of the Fathers. An explanation of this silence has been sought in the heretofore widely assumed influence of the so-called *Lex Arcana*, or Discipline of the Secret, whereby the early Christians were, it was claimed, bound to secrecy with regard to their beliefs and mysteries for fear of profanation on the part of the pagans. But apart from the obvious consideration that there could have been no sufficient reason to make a secret of the number seven, especially when we find that things so sacred as Baptism and the Eucharist are currently mentioned, the most competent authorities of the present day, Roman Catholic as well as Protestant, deny the existence of the *Lex Arcana* as a general prohibitive measure. As such it is chiefly a creation of the 17th and 18th century theologians (consult: Batiffol, 'Études d'Histoire et de Théologie Positive,' Paris, Lecoffre, 1902).<sup>\*</sup> Consequently, others endeavor to explain the silence of antiquity regarding the explicit mention of seven sacraments on the ground that no systematic, synthetic treatment of the subject was attempted by the early writers. Whatever may be the value of this consideration, it is certainly rather strange to find that so late as the 12th century Saint

Bernard enumerates no less than 12 sacraments. Roman Catholic theologians therefore rely chiefly on the so-called argument of prescription which is formulated as follows. At the time of the Reformation the entire Christian Church, East and West, was in peaceful, undisturbed possession of the doctrine of the seven sacraments. From the fact that then, as now, it was common to both the Greek and Latin Communion, is inferred that it must have been held in the Church at a period anterior to the separation of the Greeks in the 9th century. For apart from the antecedent improbability that any doctrinal growth peculiar to the Latin Church would have been adopted by her hostile rival, we do not find, as a matter of fact, that in the various discussions relative to the reunion of the two churches there was ever any difference to be adjusted relative to the number of the sacraments, though matters of seemingly less consequence were often made the object of protracted dispute. A similar line of argument, though less cogent, is pursued with reference to the Oriental sects—Nestorians and Monophysites—who separated from the Church in the 5th century. Whence, it is argued: if this doctrine was that of the Christian Church in the 5th century, it cannot be of other than apostolic origin, for the spirit of the early Church was hostile to all doctrinal innovations, as is proved by the history of the great controversies, and she would doubtless have resented any alteration of the original belief in a matter so important and of such a practical character as that referring to the number of the sacraments. It will be noticed that this argument is partly *a priori*, involving the contested assumption, that with regard to the point at issue it was impossible for the Church to have undergone any change of belief.

In the synthesis of theological speculation elaborated by the scholastics, the sacramental system was conceived as an extended application and a consistent carrying out of the great principle embodied in the Incarnation. In this mystery, according to the belief of most Christians, the invisible Godhead, the author of life and grace, was made flesh and dwelt among us, imparting to men through his tangible, human life and ministry that life of the spirit without which salvation is impossible. Hence the idea of conferring and developing the spiritual life through the instrumentality of visible material things ordained to that purpose was recognized as a principle underlying the entire economy of external means of grace in the Church. As regards the seven sacraments the theory is thus systematically worked out in the theology of Thomas Aquinas (1226-74). There is an analogy between the natural and the spiritual life in man. In the natural order man is born; he attains strength and maturity through growth; he is nourished by food; should illness occur he needs medicine; the common good requires the propagation of the race, and the supervision of legitimate authority; and finally, man needs to be prepared for his departure from this world. Now the parallel needs in the spiritual order are provided for through the seven sacraments. Thus, man is born in baptism, strengthened in confirmation, nourished by the Eucharist, and cured

<sup>\*</sup>For a well meant but quite influential defense of the old view concerning the Discipline of the Secret, consult McDonald, 'The Apostles' Creed.'

## SACRED HEART

from illness by penance; the Christian Church is propagated through matrimony, and by holy orders proper guides are provided in things spiritual, and lastly by extreme unction the believer is prepared for his passage into eternity.

While this comparison is ingenious, and instructive as a part of a logical coherent system, it cannot, of course, be adduced as a proof that there are precisely seven sacraments, for obviously it was excogitated to fit the case, and had the number of sacraments then admitted been six or eight or more, the analogy would doubtless have been worked out just as satisfactorily. It proves at most that in the 13th century the doctrine of the seven sacraments had been definitely recognized. As regards the effects of the sacraments, it may be remarked that Catholic theology claims for three of them (Baptism, Confirmation, and Orders), besides the conferring of grace common to all, the impression upon the soul of an indelible mark or "character." This effect is produced even when through a lack of disposition on the part of the subject no grace is bestowed, whence these three sacraments, when validly administered, are never repeated. If sometimes in the case of baptized converts, baptism is again administered conditionally, it is only on account of some doubt as to the validity of the rite previously conferred. The proof for the existence of this "character," which Protestants unanimously reject, is based chiefly on the ancient practice of the Church with regard to the non-repetition of these sacraments, and on certain texts from the works of early writers who express more or less vaguely the doctrine formulated later on by the theologians and the Council of Trent.

The views of the early Reformers concerning the mode of efficiency proper to the sacraments were, no less than those concerning their number, a radical departure from the received Catholic doctrine. According to the latter the sacraments produce their effects *ex opere operato*, by which formula is meant, that whenever the rite is properly administered and no obstacle or indisposition exists on the part of the subject, saving grace is imparted to the soul, by virtue of the rite itself as an instrumental cause, and independently of the dispositions of the minister or subject—at least so far as the essential effect is concerned. This mode of efficiency is sometimes expressed by saying that the sacraments contain the grace which they signify. Not that grace can be inherent in the physical symbols, but that through a divine ordinance it is infallibly connected with their administration.

While Protestant authorities are generally agreed in rejecting this doctrine, there is among them much divergence of opinion when it is a question of determining the nature of sacramental causality. Thus according to the Zwinglian and Remonstrant doctrine the sacraments are not properly a means of grace. "They were not ordained to signify, seal, and apply to believers the benefits of Christ's Redemption, but simply to be significant emblems of the great truths of the Gospel." The Reformed Church holds the sacraments to be a means whereby grace is conferred, but "their efficacy is due solely to the blessing of Christ and the working of His

Spirit, and this efficacy is experienced only by believers." According to the Lutherans the sacraments confer grace in virtue of their own inherent power, but their efficacy resembles that of a sermon; it can act with saving effect only upon believers, and the beneficial efficiency of the rite consists chiefly in animating the faith of the receiver and strengthening his confidence in the divine promises.

To substantiate the *ex opere operato* or direct, independent causality, Roman Catholic theologians adduce certain passages of the New Testament referring to sacramental efficiency, and in which the saving effect is attributed directly to the rite itself as the secondary instrumental cause. Thus in John iii. 5 spiritual regeneration is expressed as a birth of water and the spirit. Similarly Paul asserts that we have been saved "through the washing of regeneration" (Tit. iii. 5) and he admonishes Timothy to stir up the gift of God which is in him through the laying on of hands.

Another argument is based on the very ancient custom of infant baptism, one that was retained by several of the Protestant denominations. If infants are really born again to a new life by means of the ceremony of Baptism, we can scarcely conceive such an effect otherwise than as due to the immediate efficiency of the rite itself. Obviously it is not because the faith of the subject has been stimulated. Neither can the faith of the minister be the efficient cause, since, apart from other reasons, the Church has always maintained the validity of Baptism even when conferred by heretics and schismatics—the sacramental rite when properly administered was supposed to possess its own efficiency.

Consistently with this view it has been the constant teaching of the Church ever since the controversy between Pope Stephen and Cyprian in the 3d century, that neither faith nor righteousness is required in the minister of the sacraments for their valid administration. A certain intention, however, is postulated, namely, that of doing what the Church intends to effect by the rite in question. In other words, it is required that the minister intend to perform the rite not in his own name, but, implicitly at least, as a representative of Christ and of the Church. This intention can be extremely vague—in fact, reduced to a minimum—provided the effect intended by the Church be not positively excluded. As is well known, this question of the requisite intention is one of the main points at issue in the controversy concerning the validity of Anglican orders.

Other questions pertaining to the sacraments are of less importance and belong rather to a complete detailed treatment of the subject as found in the ordinary handbooks of theology.

## SACRED HEART—SACRIFICE

**Sacred Heart, League of, or Apostleship of Prayer in League with the Sacred Heart of Jesus**, a pious association whose object, the glory of God and the salvation of souls, is expressed by its motto, "Thy Kingdom Come." The association was founded at Vals, France, on 3 Dec. 1844, the feast of Saint Francis Xavier, by Father Francis Xavier Gautrelet. The director-general of the League is the father-general of the Society of Jesus, and the principal seat or centre of the association is established at Toulouse. There are also diocesan directors and local directors for every centre. Promoters, who assist in extending the work of the association, are appointed by the local directors. The names and addresses of all the members of the association are kept on record. The number is so great in many centres that the card catalogue system is used. The number of local centres in the world, in October 1903, was 60,904, and in these centres there were registered over 20,000,000 associates or members. The directors of these 60,904 local centres are in communication through their diocesan directors and 37 periodicals, called 'Messengers of the Sacred Heart,' with the general director now (1904) living at Tournai, Belgium. The 'Messenger of the Sacred Heart' is published in 22 languages; 6 of the 37 are in English and 6 in Spanish. Other languages in which it is published are German, French, Albanian, Breton, Bohemian, Chinese, Catalanian, Croatian, Flemish, Dutch, Hungarian, Italian, Malabar, Indian, Polish, Portuguese, Slavonic, Hindustani, Arabian, and Greek. In January 1904, there were about 5,000,000 members in the United States. In addition to the league periodicals, another most important means of communication are the leaflets distributed each month by the promoters to all the members. The leaflets give the 'General Intention' for which all are to pray and work during the month, and supplement the 'Messenger' in suggesting ways and means of uniting with the efforts of the missionaries throughout the world for the conversion of souls. Consult: 'Handbook of the Apostleship of Prayer'; 'Messenger of the Sacred Heart' (magazine, February 1904, New York); Ramière, 'Apostleship of Prayer.'

**Sacred Heart of Jesus, Feast of the**, a feast celebrated by the Roman Catholic Church the first Friday after the feast of Corpus Christi. This feast originated in the latter part of the 17th century, as the special and formal devotion to the Heart of Jesus, owes its origin to Margaret Mary Alacoque, a French nun of the Visitation Order. Her biographers relate that the Lord Himself appeared to her and gave her instructions regarding the devotion. Many in the Church had practised devotion to the Sacred Heart of Jesus from the time of the Crucifixion, as Cyril, Cyprian, Tertullian, Basil, Ambrose, Saint Francis of Assisi, and others, but the devotion was not general nor popularly advocated until the time of Margaret Mary Alacoque. Consult: Gallifet, 'The Adorable Heart of Jesus'; Tickell, 'Life of Blessed Margaret Mary Alacoque'; Nilles, 'De Rationibus Fectorum Sacratissimi Cordis Jesu et Purissimi Cordis Marie.'

**Sacred Monkey**, any of several apes, monkeys and baboons regarded as venerable by har-

barous people in various periods and regions. See APE; BABOON; HANUMAN; LANGUR; etc.

**Sacred Order of Siam, The**. See ORDERS, ROYAL.

**Sacred Treasure, Order of the**. See ORDERS, ROYAL.

**Sacrifice**, the offering of anything to God or to a god; also the thing so offered. Sacrifice is common to all religions. In the lowest state of inculture the sacrifice is an offering of some article of food to the god, who is believed actually to eat the flesh of the victim or the fruits of the earth, which his worshippers deposit at his customary haunts—in some cave, at some fountain, or some sacred tree. But more usually a sacrifice is a feast of which the god and his worshippers both partake. In the best times of the Roman commonwealth this idea of a meal common to the gods and men had recognition in every household; for the Roman family never rose from table at the end of the principal daily meal till a portion of the food had been consumed on the hearth as an offering to the household gods. Of like significance is the fact that the slaughter of an animal for food and the offering of one in sacrifice are expressed by the same word in Hebrew; and that the Arabians pronounce over every animal they slaughter for food the name of Allah. In all sacrifices, whether of the pagan nations or of the people of Israel, certain portions of the victim were reserved for the deity—the blood, the fat, the head, shoulders, viscera, etc.; the rest was eaten by the worshippers. Usually the portions reserved for the god were consumed by fire, whereby, for the imagination of primitive peoples, the material offerings were etherealized, ascending to heaven in savory clouds of smoke and vapor. In many religions, too, as in that of Egypt, certain sacred animals are regarded as related to the tribal god, and as such are reserved wholly for sacrificial uses. The object of the sacrificial feast is always to renew and strengthen the ties of kinship and friendship between the god and his worshippers, and so to secure the continuance of material prosperity. This primitive sacrificial system is not without religious value; at least it is genuine; the ideas which it embodies are for every worshipper realistic. And it has considerable ethical value, too, as binding the worshippers not only to the god, but to one another. The goods it seeks are material, but they are always public and social; it gives the individual no place except as a member of the tribe or gens. A new and radically different conception of sacrifice is formed when the tribal system begins to break up. Before a sacrifice can now take place an animal has first to be surrendered by its owner and consecrated. Dedication takes the place of natural sanctity. It is this new and important element that changes the character of sacrifice. The act of surrender, which is at first a mere preliminary, comes to be regarded as the essential feature. A sacrifice begins to be spoken of as a gift or tribute from the worshipper to the deity, and the original sacramental idea is gradually lost sight of. Is this a forward or a backward movement of thought? Two interpretations are possible. If the sacrificial gift is simply an expression of the truth that all private property is

## SACRILEGE — SACY

a trust from God and ought to be devoted to His service, the new conception is an advance and can do nothing but good. But if it be supposed that God stands in need of gifts, and that the more numerous and costly the oblations the greater their efficacy, the tribute-idea is a backward movement. Sacrifice then becomes nothing but a method of conjuring. The historical outcome of the gift or tribute theory is holocausts, hecatombs, and human sacrifices. These last are a strange instance of reversion to barbaric practice. Human sacrifice is natural among cannibals; the food that is most grateful to man is always presented to the gods. Its revival among civilized peoples is the result of a very different train of thought. Those who begin to measure the atoning power of a sacrifice by its magnitude, splendor, or cost cannot forget that they have possessions more precious than flocks and herds. Hence in times of great distress they begin to conjure the displeasure of their gods with offerings of their own flesh and blood.

In primitive Israel the central feature of sacrifice is always the common meal, provided for by the slaughter of the sacred animal and by various kinds of cereal oblation. Time gradually robs the meal of its sacred character, and then the holocaust becomes common. After the exile the great sacrifice is the sin-offering, which culminates in the solemn ritual of the day of atonement. It is generally supposed that the central idea of the sin-offering is that of substitution — Jehovah accepting the life of the victim for that of the sinner. That is probably a mistake. Just as in the earlier sacrificial meal, so here, the significant part of the rite is not the shedding, but the application of the life blood, followed by the burning of certain portions of the flesh and eating of others.

The thinkers of Greece and the prophets of Israel wage a constant polemic against the popular superstitions connected with the sacrificial system. Some of the latter seem to break away entirely from ritual, others do much to give it an ethical and spiritual meaning. Christianity embraces whatever is true both in the sacramental and in the dedicatory idea of sacrifice. The former idea receives its perfect expression in the first Christian rite, the latter in the first rule of Christian ethics, which transfigures sacrifice into self-sacrifice. But the followers of Christ are slow to rise to the height of His teaching. Material sacrifice is always easier than spiritual. See *OFFERTORIES AND SACRIFICES*.

**Sacrilege**, the act of violating or profaning any sacred thing or any place that has been dedicated to the service of God, as a church or a chapel; in popular usage it means breaking into a place of worship and stealing therefrom. Another meaning of sacrilege is the alienating to laymen or to common uses, of what has been dedicated, appropriated or consecrated to religious persons or purposes; as thus understood, sacrilege is an offense triable by ecclesiastical courts. In the Roman law robbery of churches was, under the Justinian Code, punishable with death. It was formerly a capital crime in English common law also, but by the statutes 24 and 25 Victoria burglary of churches is treated simply as burglary, and theft of sacred things from sacred places as larceny. Neither in the stat-

utes of the United States nor in those of any of the individual States of the Union is sacrilege treated as a crime in any way different from common burglary or larceny. Consult: Spellman, 'The History and Fate of Sacrilege.'

**Sacristan**, the original of the name 'sexton,' which is an abbreviation of sacristan, the former title being still retained in some churches. The sacristan is an officer in a church whose duty it is to take care of the church and all belonging to it, the sacred vestments and utensils, etc., and prepare whatever may be required for the sacred offices.

**Sacristy**, in the ancient Church a building attached to the basilica and consisting of three parts: (1) The reception room, in which the bishop was received by the clergy and also gave audiences. It was in this room at Milan that the Emperor Theodosius asked absolution of Saint Ambrose. (2) The sacristy proper in which the sacred vessels and vestments were kept for immediate use; here the officiating ministers robed themselves for divine service. (3) The chamber in which office books, vestments, and church plate not in present use were kept. In many modern churches the sacristy is called the vestry, and consists of but one room.

**Sacroboeco**, sāk-rō-bōs'kō, Joannes de (John of Holybush, Holywood, or Halifax), English mathematician and astronomer: b. Halifax, Yorkshire; d. Paris 1256. He entered the University of Paris in 1221, afterward becoming a professor there. His most celebrated work is a treatise, 'De Sphæra Mundi,' a paraphrase of a portion of the *Almagest* (q.v.), of Ptolemy (q.v.). It was printed in 1472, and was afterward frequently reprinted, with the additions of able mathematicians. He was also the author of a treatise, 'De Ratione Anni, seu de Computo Ecclesiastico'; a work on arithmetic, bearing the title 'De Algorismo,' which is one of the earliest treatises on the subject in which the Arabic numerals are used. It was printed at Paris in 1498, with the 'Commentary of Petrus Cirvillus.'

**Sacrum**, the sacred bone (*os sacrum*), a compound triangular bone situated at the lower part of the vertebral column (of which it is a natural continuation), and wedged between the two innominate bones so as to form the keystone to the pelvic arch. In man it consists of several vertebrae with their bodies and processes consolidated into a single bone. Its anterior surface is concave from above downward and from side to side. The posterior surface is convex, and presents in the middle vertical line a crest, formed by the fusion of the spines of the vertebrae, of which the bone is composed. The last sacral vertebra has, however, no spine, and the termination of the vertebral canal is here very slightly protected. In the female the sacrum is broader than in the male. The sacrum of man differs from that of the lower animals by its greater breadth in comparison with its length. See *ANATOMY; OSTEOLOGY; PELVIS; SPINE*.

**Sacy**, sâ-sê, Antoine Isaac, BARON SILVESTRE DE, French Orientalist: b. Paris 21 Sept. 1758; d. there 21 Feb. 1838. Obtaining a thorough acquaintance with the Greek and Latin classics, he studied Hebrew, Syriac, Chaldaean,

Samaritan, and then Arabic and Ethiopic. To these he added a knowledge of the principal European languages, including Turkish. Later he mastered Persian. During the Revolution he withdrew to a short distance from Paris, and lived unmolested, though his attachment to monarchy was well known. In 1795, when the Convention established a school of Oriental languages, De Sacy was appointed professor of Arabic, and was allowed to retain this situation notwithstanding his refusal to take the oath to the new constitution. Bonaparte made him professor of Persian in the College of France (1806), and afterward bestowed upon him the title of baron (1813). In 1808 he was elected by the department of the Seine into the legislative body; but took no part in the debates till 1814, when he voted for Napoleon's deposition. In 1815 he was appointed rector of the University of Paris, and shortly after member of the commission for public education. While officiating in these capacities he formed around him a circle of scholars, by which he became indirectly the teacher of all Europe. He took a prominent part in founding (1822) the Asiatic Society of Paris, of which he was president; and it was by his recommendation that professorships of Chinese, Sanskrit, Manchu, and Hindustani were established in the capital. In 1832 Louis Philippe raised him to the peerage and made him, after Remusat's death, which took place in this year, conservator of the Oriental MSS. in the royal library. Among his works may be mentioned: 'Principes de Grammaire générale' (1799); 'Grammaire Arabe' (1810); and 'Chrestomathie Arabe' (1806); 'Exposé de la Religion des Druses' (1808); 'Calila et Dimna' (1806).

**Saddle**, a seat for a horse's back, contrived for the safety and comfort of the rider. In early ages the rider sat on the bare back of his horse, but in course of time some kind of covering was placed over the back of the animal. The modern riding saddle consists of the tree, generally of beech, the seat, the skirts, and the flaps, of tanned pig's skin, and the construction and weight vary according to the purposes for which it is to be used. Among the varieties are racing saddles, military saddles, hunting saddles, and side saddles for ladies. The name saddle is also given to a part of the harness of an animal yoked to a vehicle, being generally a padded structure by means of which the shafts are directly or indirectly supported.

**Sad'dlerock Oyster**, a large and favorite kind of oyster originally obtained from a reef known as Saddle Rock near Norwalk Harbor, Connecticut. The supply was exhausted early in the last century, but in the first attempts at artificial cultivation of oysters (q.v.) in the eastern part of Long Island Sound many small "seed-oysters" were derived from that district, and so the name continued until it became a market term about New York for large and well-shaped oysters mostly sold to be eaten raw.

**Sadducees**, sād'ū-sēz, a sect of the Jews well known in religious history on account of being mentioned in the New Testament. Beyond their name, however, very little is known regarding them. Even the origin of their name is undecided, though there seems plausibility in the argument that it is derived from the high-

priest Zadok, who anointed Solomon as the successor of David, and whose descendants appear to have been prominent many ages after in the Jewish community. It is conjectured that the Sadducees may have been members and adherents of the house of Zadok. The Sadducees denied that the oral law, handed down by tradition as the utterances of Moses, had equal authority with the written law, and they rejected the doctrine of the resurrection, and also denied, according to the New Testament, the existence of angels and spirits. According to Josephus the Sadducees also disbelieved that there was such a thing as fate, whereas the Pharisees, the other great Jewish sect while not denying nor questioning liberty of will, held that all actions and events were fixed by unalterable decree. The Sadducees seem to have disappeared as a separate body after the first century of the Christian era, although an existing Jewish sect, the Karaites, agrees with them in the rejection of oral law. See *JEWISH SECTS*.

**Sādha**, sādā, or **Sandha**, sādā, a Hindu sect which believes in one God, and teaches a pure morality. The sect was founded 658 A.D. by a man called Bīrbhan. They have no temples, but assemble at stated periods in houses, or courts adjoining to them. They are found chiefly in Farakhabad, Delhi, Mirzapore, etc.

**Sadi**, sādī, or **Saadi** (MOULANA SHIRAZI), Persian poet: b. Shiraz about 1184; d. there 1291 or 1292. After completing his studies and spending many years in travel, he settled in the neighborhood of Shiraz, where he enjoyed the favor of several Persian rulers. The Persians esteemed him exceedingly on account of his golden maxims, which they consider as a treasure of true wisdom; and also on account of his pure, elegant, and simple style. Of his works (1) a collection (Divan) of lyric poems in the Arabic and Persian languages; (2) 'Gulistan' ('Garden of Roses'), a didactic work composed both of prose and verse, in eight books; (3) a work in verse, called 'Bustan' ('The Orchard'), containing a collection of histories, fables, and moral instructions. The complete works of Sadi were published in Persian at Calcutta (1791-5). Graf has published translations from the 'Divan' in the 'Zeitschrift der morgenländischen Gesellschaft,' and there is a German translation of the political poems by Rückert (with life of Sadi, 1894). There are editions of the 'Gulistan' by Sprenger (1851) and others, and among English translations are those by Eastwick (1880) and Ross (1821). The 'Bustan' has been edited by Graf (1858) and Rogers (1891), and translated into English by Davies (1883), and in part by Sir Edwin Arnold ('With Saadi in the Garden,' 1898). Consult Ouseley, 'Biographical Notices of Persian Poets' (1846).

**Sadi-Carnot**, sādī-kār-nō. See *CARNOT*.

**Sadler**, sād'lēr, Anna Teresa, Canadian writer: b. Montreal, P. Q., 1856. She has written much for the Roman Catholic press, and her published books include: 'Ethel Hamilton, and Other Tales' (1877); 'The King's Page' (1877); 'Seven Years and More' (1878); 'Women of Catholicity' (1885); 'The Silent Woman of Alood' (1887); 'Gems of Catholic Thought,' a compilation (1882); etc.

**Sadler, or Sadleir, Sir Ralph**, English diplomatist: b. Hackney 1507; d. Standon, Hertfordshire, 30 March 1587. He became the ward of Thomas Cromwell, was one of Henry VIII's principal secretaries of state, and was appointed by Henry's will one of the council to assist the executors upon whom was laid the government of the country and the guardianship of young Edward VI. He went into retirement during Mary's reign, but emerged after the accession of Elizabeth, and became one of Cecil's agents, especially charged with negotiating Scottish affairs. In 1568 he became chancellor of the duchy of Lancaster and thereafter he was mainly occupied as one of the English commissioners to treat of matters relating to the Queen of Scots. In 1580 he was for a time one of her guardians at Sheffield and Wingfield. His last mission was to James VI. of Scotland in 1587 to endeavor to reconcile him to the execution of his mother. Consult *Sadler's State Papers*, with memoir and historical notes by Sir Walter Scott (1809).

**Sadler, Reinhold**, American legislator: b. Prussia 10 Jan. 1848. He came to the United States when young, and has been for many years a resident of Nevada. He was elected lieutenant-governor of Nevada in 1895, and on the death of Governor Jones in 1896 became governor. He was regularly elected to the office in 1898, which he occupied until 1903.

**Sadler, Walter Dendy**, English painter: b. Dorking, Surrey, 12 May 1854. He studied art in London and Düsseldorf, and has exhibited at the Royal Academy since 1873. Among his best known pictures are: 'Thursday'; 'Darby and Joan'; 'The Widow's Birthday'; 'The New Will'; and 'For Weal or Woe.'

**Sado, sã'dô**, Japan, an island off the west coast of Honshu, opposite and 32 miles from Nûgata, with an area of 336 square miles, and a coast line of 135 miles. It has a diversified surface culminating in Kimpokusan, 3,820 feet high. South of Kimpokusan is the town of Aikawa, near the east coast, with the ancient and still productive gold and silver mines in its vicinity, to which Sado owes its celebrity. On the west coast 18 miles distant from Aikawa is Ebisuminato, the port of the island. Pop. of island 113,000.

**Sadoletto, sã-dô-lã'tô**, Jacopo, Italian theologian: b. Modena 1477; d. Rome 18 Oct. 1547. He was consecrated bishop of Carpentras, near Avignon, in 1517; belonged to the Contarini Reformation Party, and was a member of the commission appointed by Paul III. to take steps toward effecting a church reformation. He immediately opened a correspondence with Erasmus, Bucer, Sturm, and Melancthon, but when in 1539 he invited the Genevans to return to the Roman Catholic Church, he received a harsh rebuff from Calvin. After that he confined himself largely to his own diocese. He had been appointed cardinal in 1536, but while he was frequently summoned to Rome he preferred Carpentras, and his study well stocked with books of the new learning, in which he was an adept, being one of the best Latinists of his day. He wrote commentaries on the Psalms, and on the Epistles of Saint Paul, and so excellent was their style that Erasmus made the somewhat invidious remark

that "their very polish of expression will take off the edge of their pious suggestiveness." His works were published in four volumes in 1734. He was a diplomat in whom successive popes had confidence and acted as ambassador to Francis I. in the interests of peace in 1544. Consult Joly, 'Etude sur J. Sadolet' (1856).

**Sadowa, sã'dô-vã** (Czech *Sãdovã*), Austria, in Bohemia, near Königrãtz, on the Bistritz, a village remarkable as one of the hotly contested Prussian positions in the decisive battle of 3 July 1866, in which the crown prince of Prussia and Prince Frederick Charles commanding the Prussians, defeated the Austrian forces under Benedek. This battle is known also as the battle of Königrãtz.

**Sæmund (sã'moond)** the Wise, Icelandic scholar: b. Iceland about 1155; d. Oddi 1233. He undertook a course of foreign travel in pursuit of learning, and visited Paris and Rome; then, returning to Iceland, he became priest at Oddi (1176). He was unknown to scholars till about 1643, when the newly discovered 'Elder Edda' and other writings were falsely ascribed to him.

**Safe**, a receptacle for money, important papers, and valuables, usually of iron or steel, or of both combined. A safe, to justify its name, should be proof against fire, explosives, acids, drills, wedges, and the other implements and opening devices resorted to by burglars. The history of safe-making is mainly a record of struggles between the burglar and the safe-manufacturer; the result is, that safes can now be obtained which are all but impregnable. With the modern safe of the best kind the lock may be said to be the only vulnerable point; hence much care and ingenuity have been expended on its mechanism. Numerous patents, mostly of American origin, have been introduced in recent years. Of these, the keyless permutation locks deserve particular mention, as they obviate the danger which arises from lost or false keys. Such locks allow of opening only after an indicator has been moved in accordance with a certain combination of numbers arranged before closing the safe. Some safe-locks are so constructed that to be freed they require different keys on different days, some can only be opened at a certain hour, this being fixed on before the door is closed; while others again require two or more keys in charge of different persons; in fact, the arrangements contrived to render the plundering of safes next to impossible are too numerous even to mention. The connection of safes with electric alarms in a variety of ways forms another safeguard.

**Safe-conduct**, a security granted by the sovereign authority, or persons delegated by it, to strangers or other persons to enable them to repair to and return from a certain place undisturbed. In most of these cases passports have now taken the place of special safe-conducts. Sometimes the safe-conduct is given to persons accused, to secure them against harm when summoned to an examination.

**Safe Industry in America.** Various methods for the safe-keeping of treasure, jewels and other valuables have been in use since the earliest periods in history, and the advancement in this line has necessarily kept

## SAFE INDUSTRY

space of the times, the increase in the volume of wealth throughout the world of course rendering it imperative that more improved facilities for guarding this accumulated wealth be put into use. Thus we have witnessed the evolution from the old-fashioned strong-box to the massive chilled-iron and steel vaults, absolutely fire-proof and burglar-proof, till they have reached the highest degree of efficiency and perfection that science and skill can make them. Locks of rude construction were in use by the ancient Egyptians, and during the Middle Ages by the Romans. The Chinese also used a lock similar in construction to the famous Bramah lock, invented in England in 1784. These were made of wood, the tumblers being of different lengths to fit the sizes of the wards in the keys. Beginning with the Middle Ages the inventive genius of man was turned toward providing something more substantial than a lock as a method of warding off the burglar, who at that time had not attained to the remarkable skill and cunning of the modern "cracksman," and indeed the professional thief of modern times would look back with envy on his predecessor who had nothing more than a mere wooden box, sometimes bound with iron, with which to cope. The first means of securing valuables was by placing them in some secret cavity in a wall, the door of which was opened by a spring or other device, but more often articles of household furniture were used, such as desks with secret drawers, or tables and chairs with false bottoms. These constituted the chests of the wealthy for some time and some of them were furnished with locks and bound with strips of iron, the whole very artistically made so as to ward off suspicion of their contents. The oaken-chest or strong-box, reinforced with iron bands and knees, was in the beginning of the 18th century considered to be the best means of security. Such a chest was used in 1707 to guard the crown jewels of Scotland, but when they were to be examined by the Royal Commissioners, the locks of the chest had to be broken and the lid forced up because there was no other manner in which the chest could be opened, an operation which the modern blacksmith would consider an easy task to perform.

Prior to the beginning of the 19th century practically no attempt was made to make these strong-boxes of a material which would withstand heat or which would in any way render them impervious to the ravages of fire. The first improvement along this line was made in France about 1820, the safes then constructed consisting of a metal box built within double walls, the space between being filled with a composition of non-conducting substances. A little later a so-called fire-proof safe was constructed in New England, considered to be a vast improvement over the existing types. This safe had a body of solid oak plank from three to four inches thick, which, after being thoroughly saturated with an alkali, was covered with sheets of thin iron. To make this more surely fire-proof bands of iron were crossed and recrossed over these plates and nailed down with large round-headed iron spikes,

the whole affair being a very gruesome and formidable looking object. The great fire in New York in 1835 proved the worthlessness of these, several hundred of them being then destroyed. The idea of filling in the walls of a safe with a nonconducting substance was first put into use in this country in 1843 by Daniel Fitzgerald. His idea was to fill the walls of the safe with plaster of paris because of its tendency to throw off heat, and having secured a patent on his invention he immediately began to manufacture a safe known as the "Salamander." His patent was later assigned to B. J. Wildey, who made a safe called "Wildey's Patent," the principle of these being to leave the space between the walls empty, trusting that the contents of the inner portion of the safe would be protected from heat by the nonconducting properties of the air. Other mixtures such as asbestos, mixed with plaster of paris, clay, alum, fire-clay, mica, chalk, etc., were then used to fill the vacant space but none of these have proven absolutely safe. To-day the modern safe is filled either with a substance, alum or some other salt, which when heated gives off a quantity of water; or by placing in the walls a receptacle, either glass or metal, containing water so as to give off steam when the outside walls become overheated. The idea of using steam as a nonconductor originated with Prof. A. K. Eaton, of New York, who learned by experiment that the contents of a safe could not be injured by fire so long as steam at 212° F. surrounded the inner chamber, but the main objection to the use of water as a nonconductor lay in the fact that this subjected the contents of the safe to constant dampness. The use of substances which contain water in their chemical composition has, however, largely done away with this objection.

Outside of the fire element, the most important part of the safe to be considered is the lock, for with our modern methods of fire protection the danger of burglary is more imminent than the loss by fire. The first supposedly nonpickable lock was the Bramah, but this was finally proven to be valueless and easily picked, this being done in 1851 by a Mr. Hobbs, by the "tentative process." Three other locks then came into use, the Chubb, also picked by Mr. Hobbs. The Pye lock, invented in 1851, but picked by Linus Yale, Jr., of Philadelphia, by the "impression process," and the Yale lock. Since then many new forms of locks have been invented, and the modern lock-combinations are constructed in a manner which has made the trade of burglary extremely difficult while they are otherwise absolutely fire-proof. There are three ways of procuring security against burglary, first, by the laminated construction; second, by the use of blocks of chilled iron, this method being more useful in the construction of large vaults than in the making of portable safes; and third, by the spherical chilled-iron safe. In the first method of construction the chamber is made of alternate layers of hard and soft plates of iron and of plates of hardened steel, the two laid alternately over each other in the walls of the chamber in such a way that they form a single mass. Thus the

## SAPED — SAFETY-VALVE

body of the safe being constructed of alternate plates of iron, welded iron and steel, carbonized and decarbonized steel, and crystal steel, fastened together by means of bolts from the inside has made safes practically impregnable to the appliances used by the modern burglar, such as sledge-hammers, jimmies, jackscrews and other devices. Another method of making safes, in common use by manufacturers, is to roll down together while hot into one solid sheet of tempered steel three layers of soft iron or steel alternated with two intermediate layers of hard steel. These composite sheets, when they have been rolled till about one-half of an inch thick, are then built into the walls of the safe and alternated with plates of heavy steel about one-half inch thick. The doors are generally the weak point in the construction of a safe, for it is these which a burglar first attacks to see if there is any crevice into which a wedge might be inserted, or any crack into which nitro-glycerine or any other high explosive might be introduced. In some safes the plates comprising the door are dovetailed, engaging with the corresponding parts of the jamb; in some an air-tight packing is used between the jambs and their abutments; while in others a screw door is used.

One solid mass of metal is used in the second and third types of safes, the tough and hard qualities of the metal being obtained by modification. The metal used is a soft, malleable iron, the surface of which can be hardened by cooling. In the construction of many vaults, blocks of this "chilled-iron," weighing from three-quarters to several tons, are bolted together on the inside, the sides being dovetailed together, and the outside surface is chilled to the highest degree of hardness. The door is a single casting of iron, two inches thick, and also chilled on the outside.

In the third type, the spherical, invented by William Corliss, the shell, constructed of steel from four to seven inches thick and chilled to a depth of about two inches, sometimes contains a "bugging" made from Franklinite ore found in Sussex County, N. J. This material, which possesses a hardness exceeding that of the best tempered steel, and is in appearance somewhat like crystallized silver, is so interwoven with wrought-iron rods that it can be battered with the greatest degree of force but will only bend, not break. The purpose of this construction of wrought and crystallized iron is to hamper a burglar in his work, it being supposed that in an attempt to drill through the walls of the safe, the drill will penetrate the soft metal more readily than the hard, and, consequently, working sideways, will be broken off when it strikes the hard metal. The "bugging" may, however, be used in precisely the opposite manner, the rods being made of the hardest tool-steel and the body of the filling composed of cast-iron segments, but the principle of turning the point of the "cracksman's" drill is the same.

In our large banks and safe-deposit vaults there is no room sufficiently large to contain the number of individual safes which would

be required to hold the enormous masses of money and other valuable securities with which these institutions are intrusted. This has turned the attention of the manufacturer in recent years to the building of large vaults which would be absolutely fire and burglar-proof. The interior of these vaults may be constructed to suit the tastes and requirements of the owner, but the walls are now made much thicker than formerly and the builder has made more use of fire-proofing materials. The most important feature of the modern vault is the lock, which has now reached the acme of perfection. The first form of lock used was the combination-lock, an outgrowth of the "tumbler" lock, and the mechanism of these is very ingenious. These locks are not limited in the number of combinations upon which they may be set, and may be changed at any time should the combination become known to undesirable persons. The most valuable asset of the modern vault, however, is the chronometer, or time-lock, the mechanism of which is as intricate and as complicated as the best watch but at the same time it runs as true and as smoothly. To offset any possible disarrangement in the mechanism of a single clock, which would, of course, prevent the opening of the safe, three movements are usually enclosed in a single case. As these safes cannot be opened by any human agency until the time set for the clock to operate the mechanism which swings back the ponderous doors, it is obvious that the chronometer combination is the greatest safeguard against robbery which the bank can employ.

In 1905 there were 31 establishments engaged in the manufacture of safes and vaults, capitalized at \$7,326,133. There were 415 officials and salaried clerks, with yearly salaries of \$723,097; wage-earners, 3,488; wages, \$2,162,246; miscellaneous expenses, \$801,309; cost of materials used, \$3,211,336; and producing goods annually to the value of \$7,861,069. The value of the American safe has been recognized in foreign countries, and to-day may be found throughout Great Britain, Europe, Asia, Africa, Australia, South America, etc. See LOCK; FIREPROOFING; BUILDING; BUILDING; Fireproofing; VAULT, ETC.

**Saped**, *sâ'fêd*, Palestine, occupies the summit of a hill 2,700 feet high, on the shores of the Mediterranean, six miles northwest of the Sea of Galilee. Safed was a fortified place of importance during the Crusades, and is one of the four holy cities of the modern Jews in Palestine, their settlement dating from the 16th century. Pop. (estimated) 19,000.

**Safety-Lamp**. See LAMP.

**Safety-valve**, a device used upon steam boilers and other vessels subject to an internal pressure, for the purpose of automatically preventing that pressure from rising to a dangerous intensity. It consists essentially of an opening in the boiler (or other vessel), over which a suitable lid or "valve-disk" is fitted. The valve-disk is pressed against its opening with a definite, constant pressure, whose magnitude is regulated according to the pressure that the boiler is intended to carry. So long as the pressure that the steam within the boiler exerts upon the under side of the valve disk is less

## SAFFLOWER—SAFFRON

than the constant force with which the disk is pressed down upon the opening, the valve remains closed, and no steam escapes. If the pressure within the boiler rises, however, so that the steam exerts upon the disk a total pressure that is greater than the external force that tends to hold the disk in place, the valve opens and permits steam to escape until the pressure in the boiler is sufficiently reduced for the external force to again close the opening. There are three general types of safety-valve in use, which are respectively known as "dead-weight," "lever," and "pop" valves. The fundamental principle of operation is the same in all, and the classification relates merely to the means that are employed to hold the valve-disk against the opening in the boiler. In the "dead-weight" valve, this is accomplished by placing weights directly upon the valve-disk. Safety-valves of this type can be recommended for low pressure boilers, and they are greatly used, in England, upon heating boilers, and also upon kitchen boilers. They are not adapted for use in connection with high pressures, however, for the load resting upon the valve-disk must then be very great, in order to prevent the valve from opening at the ordinary running pressure. It is common, therefore, to use the "lever" type for high pressure service. In this type the valve-disk is held against its seat by the action of a weight, but the weight does not rest directly upon the disk. A horizontal lever two or three feet long is provided, and this is pivoted at one end, while the weight is attached near its free end. The centre of the valve disk comes directly under the lever, a few inches from the pivoted end, and the lever is supported by means of a stout vertical rod whose lower end rests upon the centre of the valve-disk. By this means the total downward force acting upon the disk and tending to keep it in position may easily be made to be eight or ten times as great as that which would be realized if the weight rested upon the valve-disk directly; and the pressure at which the valve will open can be nicely regulated by shifting the position of the weight upon the lever arm. In the "pop" valve, the disk is forced against its seat by means of a stout spiral spring, which is held in position by a framework, or casing, which is securely attached to the boiler. The compression on the spring is regulated by means of a screw that acts upon its upper end, and which can be turned by a wrench. It is now customary, however, to have the adjusting screw entirely within the casing of the valve, so that the attendant in charge of the boiler cannot tamper with it; the casing being provided with a lock, the key to which remains in the possession of the owner of the boiler. The name "pop" refers to the sound that these spring valves make when they open and close. Lever valves and dead-weight valves open and close gradually, and before they open they give warning by a hissing sound. "Pop" valves, on the contrary, open without any such premonitory signal, and when they close they do so with corresponding quickness. "Pop" valves are used exclusively upon railroad locomotives, as the violent swaying and vibration to which these are subject would render weighted valves undesirable.

**Safflower**, a large thistle-like composite plant (*Carthamus tinctorius*) with orange-colored flowers, said to have been originally brought from the East, but now naturalized in many parts of Europe, and extensively cultivated. The tubular flowerets are collected, dried, and somewhat used as a feeble laxative medicine, in place of, or as an adulterant of, saffron. They are, however, chiefly important as the source of carthamin, a dyeing principle originally much employed by the Chinese, and later by occidental silk manufacturers, as it gives brilliant, although fugitive red tints; mixed with French chalk, it forms the cosmetic rouge. In Spain the flowers are used to color soups, and other dishes. The Jews in Poland are remarkably fond of the flowers, and mix them with their bread and most of their viands. Oil, in India, is expressed from safflower seeds, for culinary and lighting purposes.

**Safford**, *saff'ord*, Truman Henry, American mathematician: b. Royalton, Vt., 6 Jan. 1836; d. Newark, N. J., 13 June 1901. He was early known as a calculator of great skill; in 1845 prepared an almanac; by a method of his own abridged by one fourth the task of computing the rising and setting of the moon, and after his graduation from Harvard was officially connected with the observatory there in 1854-66, acting in 1866 as director. In 1865 he was appointed professor of astronomy in the University of Chicago and director of the Dearborn observatory, in 1874-6 was a member of the United States coast-survey, and in 1876-1901 professor of astronomy in Williams College. He was a fellow of the American Academy of Arts and Sciences, of the American Association for the Advancement of Science, and an associate of the Royal Astronomical Society of England. He studied the nebulae, discovering many new ones, computed cometary and planetary orbits, and for some time devoted his attention to latitude and longitude work for the United States corps of engineers, for which he prepared a star-catalogue. Among his further published writings were a catalogue of polar-stars, 'Mathematical Teaching and its Modern Methods,' and numerous contributions to astronomical journals, to the 'Proceedings' of the American Academy, and to the notices of the Royal Society.

**Safford**, James Merrill, American geologist: b. Zanesville, Ohio, 13 Aug. 1822. He was graduated from the Ohio State University in 1844 and in 1848-72 occupied the chair of natural science at Cumberland University, Lebanon, Tenn. He was professor of chemistry at the University of Nashville and at Vanderbilt University in 1874-94, and of natural sciences at the latter in 1875-1900, where he now occupies the chair of geology. He was State geologist of Tennessee in 1854-60 and 1871-1900. His publications include many papers on geological subjects, beside: 'Geological Reconnaissance of Tennessee' (1856); 'Geology of Tennessee' (1869); 'Elements of the Geology of Tennessee' (1900); etc.

**Saffron**, a bulbous autumnal plant (*Crocus sativus*) and a commercial dye-stuff obtained from it. The cultivated saffron originated probably in the Levant, and was grown in early times about the town of Corycus, Cilicia (from which the *Crocus* genus may have taken its name).

## SAG HARBOR—SAGAŒTA

The Arabs cultivated it in Spain, about the 10th century, and it was an important crop in England, especially about Saffron Walden, in the 15th century, bringing the highest market price. It is now raised about the Mediterranean, and in Asia. The saffron is low, with the grass-like leaves, and long-tubed, funnel-shaped flowers, springing directly from the ground, which are characteristic of the crocuses. Its flower is purple, with a style tipped with three orange-colored stigmas, each more than an inch long, depending from one side of the perianth. These stigmas are picked off in the early morning, and dried on a kiln, either loosely or between layers of paper, and under the pressure of a thick board which forms the mass into cakes, about 4,000 of these stigmas being necessary to give an ounce of saffron. In either case the commercial saffron is liable to suffer from adulteration. This adulteration was so prevalent at one time that those guilty of it (when caught) were killed.

Saffron stigmas, when genuine, have a characteristic orange red color, and an aromatic, bitter odor and taste. The substance has faint carminative and narcotic properties, but is seldom used medicinally, except for coloring tinctures. In the 'Song of Solomon' the saffron is mentioned among the sweet-smelling herbs, and it was much in demand among the Greeks and Latins for its perfume. A fragrant essence was made from it with water and wine for sprinkling in theatres and other places, even in the streets, for anointing the hair, and for the bath. Saffron was also much employed in culinary operations, chiefly for its aromatic taste and for coloring, as the clown in the 'Winter's Tale' says he "must have saffron, to color the warden pica."

Saffron, however, is most commonly used as a dye, giving a yellow hue to cloth, but is being displaced by cheaper colors. This tint was in very early times the royal color in Greece, and was that of some of the women's court robes, but afterward was appropriated by the betairæ. In Ireland and the Hebrides it was also the color of the king's mantle, and of the shirts of persons of rank. Saffron enters largely into the composition of the sacred spot on the forehead of a Hindu Pundit. An extract made from saffron, used as a glaze on tinfoil, imitated gold in mediæval illuminations, and was also employed by painters.

Helen Ingersoll.

Sag Harbor, N. Y., village in Suffolk County; on Gardiner's Bay, an inlet from the Atlantic Ocean, and on the Long Island railroad; about 100 miles east of New York. It has a good harbor, regular steamer connections with New York and several of the Long Island coast towns. It has several manufactories, chief of which are a watch-case and silverware factory, flour and cotton mills, a tannery, and machine shops. The Sacred Heart Academy (R.C.), opened in 1877, a Union school, public and parish schools, and a library constitute the educational institutions. There are three banks with a combined capital of \$100,000. The village is a favorite summer resort.

At one time Sag Harbor was noted for its interests in whaling; its income from that industry amounting to \$1,000,000 some years. In those days its tonnage equaled that of New York. The Indian relics found in and near the

village show it was once an important Indian settlement. Pop. (1910) 3,408.

Saga, sã'gã, from the word meaning "to say," is a narrative of the past handed down by word of mouth. The name is applied to a large collection of mythical, semi-mythical, and historical works written mainly in Iceland chiefly in the 12th and three following centuries. The most conspicuous and important of the historical sagas are Snorre Sturlasson's Heimskringla, the Njals Saga, the Egla, and the Sturlunga Saga. Consult Horn's 'History of the Literature of the Scandinavian North,' translated by Anderson. In Scandinavian mythology the name of the goddess who presides over history. She dwells in Sokkvabog, where she and Odin sit drinking joy from golden goblets.

Saga, sã'gã, Japan, capital of the province of Fizen, on the island of Kiu-siu, 74 miles northeast of Nagasaki. It is an important seaport and commercial centre. The town is intersected by numerous streams, chief of which is the channel of Sentonofutsi, 50 miles long. It unites the Gulf of Simbara with the Northern Sea, and is of considerable commercial importance. Pop. 32,753.

Sagard, sã-gãr, Theodat Gabriel, French Roman Catholic missionary. He labored in converting the Huron Indians to Christianity during the 17th century, and contributed, in an important degree, to a knowledge of Canada in its early colonial days as "New France." His principal works are: 'Travels to the Huron Country, towards the Freshwater Sea and the Uttermost Limits of New France, called Canada; Wherein is Treated of all Matters touching the Country, the Manners and Character of the Savages; their Government and their Ways, as Well in their Own Country as when Roaming; of their Faith and Belief; with a Dictionary of the Huron Language' (1632); also, 'History of Canada and the Journey made by the Friars Minor Recollects Thither, for the Conversion of Unbelievers.' An edition of his works was published at Paris in 1866.

Sagasta, sã-gãstã, Praxedes Mateo, Spanish statesman: b. Torrecilla en Cameros 21 July 1827; d. 5 Jan. 1903. He studied at the College of Engineers in Madrid, practised as an engineer in Valladolid and Zamora, in 1854 was elected from Zamora province to the Cortes, where his attitude was a radical one, and in 1856 for participation in an unsuccessful revolt was compelled to escape to France. Upon the proclamation of amnesty, he returned, became professor in the Madrid College of Engineering, re-entered the Cortes, was identified with the Progressive minority, and edited its journal, 'La Iberia.' After the outbreak of 22 June 1868 he again fled to France, but at the beginning of the revolution of 1868 was once more in Spain, where he became minister of the interior in the provisional government. In October 1871 he was chosen to the presidency of the Cortes. In December entered the Malcampo cabinet as minister of the interior, in February 1872 was commissioned to form a new ministry, but in May was forced to resign. In 1874 he appeared anew in office as minister for foreign affairs in the Serrano cabinet, shortly afterward ex-

changed his portfolio for that of the interior, and in August became president of the ministry. He retired from office at the accession of Alfonso XII, for a time was a leader without a party, as a member of the Cortes was finally associated with Martinez Campos (1881) in the organization of the new Liberal party, and upon the overthrow of the Conservatives became president of the ministry. He was forced from power in 1883. Subsequently he was president of the Cortes in 1883-4, and of the ministry in 1885-90 and 1892-5. In September 1897 he was again summoned to form a cabinet. He recalled Weyler from Cuba, appointed Blanco captain-general, and drafted a plan for Cuban autonomy. Although opposed to the war with the United States, he waged it with such efficiency as his limited resources would permit, and was loudly denounced for signing the treaty of peace. On 4 March 1899 he resigned with his entire cabinet, though on 6 March 1901 he again took the helm, and, after averting a Carlist insurrection, remained in office until 3 Dec 1902. He has been characterized as "singularly devoid of the blind arrogance which has been the bane of so many Spanish statesmen." After Canovas' death, he was conceded to be the greatest political figure of Spain.

**Sage, s<sub>1</sub>j**, Henry William, American philanthropist: b. Middletown, Conn., 13 Jan. 1814; d. Ithaca, N. Y., 17 Sept. 1897. In 1833 he engaged in the lumber business which he conducted until 1854, and settling at Ithaca, N. Y., entered the New York Assembly in 1847. His earlier benefactions were the endowment of various schools and churches, the West Bay City, Mich., public library, and the Lyman Beecher lectureship at Yale College. In 1870 he became a trustee of Cornell University and his various gifts to that institution were \$266,000 for the Sage College for Women; \$200,000 for the Sage School of Philosophy; \$50,000 for the Susan Lyon Sage chair of philosophy; \$260,000 with an additional endowment fund of \$300,000 for the University Library Building; \$20,000 for the Museum of Classical Archeology; \$11,000 for the Sage professorship of philosophy; \$300,000 for floating indebtedness. His careful management of timber lands owned by the institution realized for it about \$6,000,000.

**Sage, Russell**, American capitalist: b. Verona Township, Oneida County, N. Y., 4 Aug. 1816; d. Lawrence Beach, L. I., 23 July 1906. He began life as clerk in his brother's grocery store; entered the retail grocery business for himself in 1837, and during 1839-57 was a wholesale grocer at Troy, N. Y. He was alderman of Troy in 1847; treasurer of Rensselaer County, and a Whig member of Congress during 1853-7. In 1863 he removed to New York and shortly began large operations in railroad and other securities. He accumulated one of the largest fortunes in America and was a director in many large corporations.

**Sage, William**, American novelist, son of Abby Sage Richardson (q.v.): b. Manchester 8 May 1864. He was educated in France and Germany, was engaged in railway and banking business 1881-96, and since then has given his attention to literature. He has published 'Robert Tournay' (1900); 'The Claybornes' (1902); 'Prenchy—The Story of a Gentleman.'

**Sage**, a name covering both the common garden herb (*Salvia officinalis*) and other plants of diverse families, somewhat resembling it in color or odor. The cultivated sage is a labiate, and the genus differs from the majority of Labiate, in having two stamens instead of four. It is a native of southern Europe, is a shrubby perennial of hoary aspect, bearing rough, wrinkled, gray-green, opposite leaves, on the decumbent stems, and pale-blue, streaked flowers in verticillate spikes at the extremities of the branches. It has been widely cultivated, for at least three centuries, on account of its aromatic odor, and bitter, pungent taste. It was formerly used in medicine, having slight tonic, stimulant, and astringent properties. An infusion of the plant, or "sage-tea," was drunk in England before the advent of Chinese *Thau*, was a favorite remedy for colds, and is even now employed as a gargle. An old English proverb states that "He that would live for aye must eat sage in May." See *HANNA, CULINARY*.

Many *salvias*, or sages, are frequently cultivated for their brilliant flowers. The most common, perhaps, are the scarlet sage or *salvia* (*Salvia splendens*) with racemes, perhaps a foot long, of slender flowers two inches long, arranged in whorls, both calyx and corolla being of a most brilliant scarlet hue; and the equally large-flowered but blue-tinted *S. patens*. The woolly white foliage of *S. argentea* has caused it to be included in gardens, and there are a score of others quite worthy of cultivation for ornament.

Several genera of the *Chenopodiaceae*, a family which takes kindly to alkaline soils, and which inhabit the desert regions of western North America, are called salt, sweet or silvery sages. Bitter sages are *Compositae*, and are more commonly known as sage-brush (q.v.). The salt sages are species of *Atriplex*, living on thousands of acres of waste lands, which are strongly impregnated with alkali, and so dry that little other vegetation can exist. Since water is so scarce in certain of these alkali deserts, stock can not be taken into them in summer, and the sages make a good growth, the fruits, valuable for their nutritive qualities, become ripened and the leaves "sun-cured," which, together with the tender spring shoots, make excellent forage, particularly for sheep. The flocks are taken in in winter, when the snow furnishes water for them, and eat the salt-bushes greedily. Nuttall's sage (*A. nuttallii*) being the most valuable, as it is perennial with a deep, woody root, and although cropped, seeds and all, quite down to the ground, survives and starts up again, during the summer, when it is undisturbed. In fact, the constant cropping of these pastures, and the constant manuring, are improving the winter ranges, which are thus becoming nearly as valuable as the summer ones. The sweet-sage or winter-fat (*Eurotia lanata*) is another highly prized winter forage plant, a foot or more high from a shrubby base, whitened with long hairs, perennial, and with abundant fruit, that contributes largely toward the great fattening qualities attributed to this sage, which is also supposed to have a beneficial effect on the grazing stock. The shad-scale, a spiny, shrubby salt-sage (*Atriplex confertifolia*) produces in the spring tender shoots and thick succulent leaves, and enormous quantities of flat, winged seeds. These are eag-

## SAGE-BRUSH—SAGINAW BAY

erly sought at the time, and, in the autumn, when leaves and fruit have dropped, and been blown into hollows of the plain, the sheep seek them out, and devour them utterly.

HISLAW INGLELL.

Sage-brush, any one of the species of the genus *Artemisia*—composites very abundant in the arid, alkaline regions of the Western United States, where the soil is not too saline, and, with other desert vegetation, covering immense areas. The best known sage-brush is the common shrub, or bitter-sage (*A. tridentata*), which is found growing on the plains, and ascending to the sub-alpine parks of the mountains. It varies in different situations from a dwarfed shrub to almost tree-like proportions, when its trunk near the ground will measure nearly a foot through, being twisted and knotty, and loosely enveloped in a light-gray, shreddy bark.

Sage-brush State, or Sage-hen State, a nickname for the State of Nevada, from the large amount of sage-brush growing there.

Saginaw, Mich., a city, and county-seat of Saginaw County, on the Saginaw River, 16 miles from Saginaw Bay, 97 miles northwest of Detroit, and 65 miles northeast of the capital at Lansing. The railroads entering the city are 6 divisions of the Pere Marquette, 3 divisions of the Michigan Central and 1 division of the Grand Trunk.

**History.**—The City of Saginaw is a consolidation of old Saginaw City, East Saginaw and the Village of Salina or South Saginaw. The latter was incorporated as a village in 1866 and became a part of East Saginaw in March 1873. East Saginaw was incorporated as a village in 1855 and as a city in 1859. Saginaw City was never incorporated as a village, its first incorporation being as a city in 1857. The two municipalities, East Saginaw and Saginaw City, were consolidated by act of the legislature of 1889 into the City of Saginaw, and the first meeting of the common council of the consolidated city was held March 12, 1890. The site upon which this prosperous community is located was first settled in 1815 by men of French origin and half breeds. The city comprises about seven square miles, the east side being 27 feet above the river and the west side 35 feet.

**Government.**—The form of government is by a mayor elected every two years and a council of 20 members, one from each of 20 wards, to serve for two years. Various city boards are appointed by the mayor subject to confirmation by the council.

**Manufactures, Industries, Buildings, etc.**—Saginaw was at one time the centre of the white pine industry, and millions of dollars worth of logs have been floated on the bosom of her river. This vast industry has of late years given way, in a measure, to manufacturing, and the city is now (1904) distinctively a manufacturing and jobbing centre. Some of the manufactures are beet sugar, plate glass, salt, iron and steel products, furniture, pianos and musical instruments, vehicles, baskets and a great variety of wood products, malt liquor and flour. It has planing mills, lumber assorting yards, brick yards, tanneries, graphite works and a variety of foundry and machine shops, in addition to the big shops of the Pere Marquette R.R. Co. The bituminous coal fields of Saginaw and vicinity employ 1,500 miners from the

city alone, and the pay roll is \$100,000 a month. The total number of wage earners in Saginaw is 26,000. According to the 1900 census, the number of manufacturing institutions in the city was 203, with a capital of \$26,703,000, number of employees, 6,858; annual wages paid, \$4,110,000; value of output, \$18,833,000. The assessed valuation of Saginaw for 1904 was \$23,971,068, and the net debt of the city was \$1,524,022, but this includes water bonds of \$500,000 on a water plant valued at \$1,000,000, which the city owns. The total expense for running the city for the year was \$420,861. The city has 58 miles of water mains and uses the Holly system of water supply, from two pumping stations, one on each side of the river. It has a fine sewerage system with 70 miles of sewers; 10 small parks; 54 miles of finely paved and beautifully kept streets, many of them laid with asphalt. The streets of the city are for the most part notable for their width. They are traversed by an excellent electric street railway system, and two interurban roads reach out into the surrounding country. The city has 46 church edifices and 5 missions. The hospitals are the Saginaw General Hospital, Saint Mary's Hospital, and the Woman's Hospital. Other charitable institutions are the Home for the Friendless, and Saint Vincent's Orphan Home. Fiduciary institutions are represented by 6 national and State banks, with a capitalization of \$700,000 and \$200,000 surplus and deposits of over \$10,000,000. Besides these, there are 2 private banks. Saginaw possesses a \$300,000 Manual Training School, and is also the seat of the Michigan Employment Institution for the Blind. It has the Hoyt Reference Library of 27,000 volumes, besides 2 other public circulating libraries. The educational system has at its head 2 finely equipped High Schools and the graded schools require 26 buildings, nearly all of the most modern character. There are in addition several private business colleges, the German Lutheran Theological Seminary, and 16 parish and parochial schools and academies. The city has one of the finest Masonic Temples in the State, a handsome Federal Building, 2 theatres and numerous capacious public halls. The east and west sides are connected by a number of fine bridges over the river, so that access is easily obtained from the business centre to the most remote parts of the city. In addition to the numerous small parks, the city has a large suburban resort, operated in connection with the street railway system. The population of Saginaw is cosmopolitan in character, the German possibly predominating, as attested by their numerous large and prosperous societies of an educational and social character. The Irish, French, and Bohemian are also conspicuous elements of the city's population, which, according to the census of 1910 is 50,510.

JOHN T. WINSHIP,

Editor 'Saginaw Evening News.'

Saginaw, a river in Michigan which is formed by the junction of the Flint and Shiawassee, and flows nearly due north into Saginaw Bay. The main stream is only about 30 miles long, but with its branches it drains a large portion of the Lower Peninsula. It is navigable to the city of Saginaw, 24 miles.

Saginaw Bay, the largest inlet of Lake Huron on the coast of the United States. It

## SAGITTARIA.—SAGUNTUM

Indents the east coast of the Lower Peninsula of Michigan. It is about 60 miles long and 30 miles wide. It is a safe harbor and never dangerously rough, although it is sometimes subject to storms. The color of the water is different from that of the open lake; it is a brownish-green.

**Sagittaria**, sâj-i-tâ'ri-â, a genus of the water-plantain family (*Alismæ*). It is a widely distributed genus, wholly or partly aquatic, native to the temperate zones and the tropics. The species are handsome, with lance-like, elliptical or arrow-shaped leaves, erect or floating; the flowers are verticillate in trios around the upper part of the scapes, that carry them well above the water, and are 3-merous, with beautiful white and crinkled fugacious petals. The common arrow-head (*S. variabilis*), grows in the mud along rivers and ditches, and is very ornamental with its charming whorls of flowers rising from the centre of a cluster of large, erect sagittate leaves, varying surprisingly in different plants in respect to size and shape. It is a perennial, with thick fibrous rootstocks, which produce oval, fleshy tubers, often as large as a hen's egg, abounding in starch, and a staple and nutritious article of food with many Indian tribes. The squaws sometimes waded into the mud where the arrowheads grew thickly, loosened the tubers with their toes, and when the plants floated to the surface, captured them and flung them into canoes, to be boiled or roasted. *S. clematis* is cultivated in China for food.

**Sagittarius**, sâj-i-tâ'ri-âs, in astronomy, the ninth sign of the zodiac, into which the sun enters 22 November. The constellation consists of eight visible stars. It is represented on celestial globes and charts by the figure of a centaur in the act of shooting an arrow from his bow.

**Sago**, a farinaceous food, obtained from the central portion of various species of tropical palms, principally, however, from *Metroxylon rumphii*, or *M. lawii*. The sago-palms flourish in wet soil, and are cultivated in the East Indies, and particularly in Sarawak. They are rarely over 30 feet high and have stout stems, with an outer rind about two inches thick, as hard as bamboo, but filled with spongy pith, containing a large proportion of starch.

The preparation of sago is one of the industries of the East Indies. The trees flower only once, and if allowed to do so, and to fruit, would exhaust the mass of starch stored in their stems, and then die, after propagating themselves either by seeds or by offshoots. To prevent this, the trees are felled when they are about 15 years old, and on the point of flowering. The starchy tissue, then most productive, is extracted, and pounded or grated to a powder. This is kneaded in water, in a cloth or sieve, the escaping water carrying the starch into a trough, where it is washed and settled out, until fit for use. The water is then drawn off, and the caked residue is ready for native cookery. This cake, or meal, when made into a paste and pressed through a sieve, forms fine pearly grains, which are left either in their original brownish hue, or are bleached, and compose the commercial product "pearl-sago."

Vol. 18—18

Sago-meal is eaten by the natives as pottage, or as biscuits, partially baked in earthen molds. It is not entirely soluble in hot water, as is ordinary starch, and can therefore be employed in making puddings, etc., forming a valuable article of food, as it is cheap, nutritious and easy of digestion. In Europe it is used for feeding stock, making starch, and by cocoa manufacturers for their beverages. Inferior qualities of sago are produced by *Phanis farinifera*, *Corypha* of various species, *Caryota wrens*, *Raphia flabelliformis*, and two South American palms.

Portland sago is a delicate farina extracted from the corm of the European wake-robin (*Arum maculatum*). Wild sago is the product of the coontie-root (*Zamia integrifolia*), a cycadaceous plant of Florida, well known as an article of food among the Seminoles; and other cycads, incorrectly called "sago-palms," furnish a coarse kind of sago.

**Sagoin**, sa-goin', or **Sagouin**, a French form of the native South American name of a genus (*Callithrix*) of Brazilian monkeys, of small size and remarkably light, active, and graceful in their movements.

**Sa'goyewath'a**. See RED JACKET.

**Sagua la Grande**, sâ'gwâ lâ grân'dâ, Cuba, town, province of Santa Clara; on the Sagua la Grande River; 150 miles east of Havana. It is connected by railroad with La Isabela, its port on the north coast, with Cienfuegos, Havana, and Matanzas, and with towns to the east; and carries on a considerable trade, sugar and molasses being the chief exports. Formerly gold was mined in the vicinity to some extent. It is well built, with wide and regular streets; among its public buildings are a hospital, a town hall, and a large church; it has also several schools.

**Saguenay**, sâg-t-nâ, Canada, a large river in the province of Quebec, emptying into the Saint Lawrence at Tadoussac Harbor. It is about 100 miles long with a remarkable depth—17 to 500 fathoms. It drains Lake Saint John and flows with almost unparalleled impetuosity, between high rocky walls and over deep precipices, forming numerous falls and cataracts in its upper course. Its magnificent scenery attracts many tourists. It is navigable for large vessels as far as Ha Ha Bay, 10 miles south of Chicoutimi.

**Saguntum**, sa-gûn'tûm, or **Murviedro**, Spain (*Hispania Tarraconensis*), situated near the mouth of the Palantias, three miles from the coast and 18 miles by rail from Valencia; was a rich commercial town in early times, especially famous for its figs and manufacture of a certain kind of pottery. The town was founded by Greek and Italian colonists. In the interval between the first and second Punic wars, it formed an alliance with the Romans, and became celebrated for the resistance it made to Hannibal in the siege of 219-18 B.C. The city was nearly destroyed at this time, but the Romans rebuilt it and made it a colony. The ancient city is now replaced by the modern Murviedro, and the only important ruins are those of the theatre. Pop. (1900) 6,764.

**Sahara**, *sa-hā'ra*, Africa, the great desert region in the north of the continent, extending from the Atlantic eastward as far as the Nile, and from the Mediterranean provinces to the Niger and Lake Tchad. Its area contains 3,459,500 square miles,—a region equal to the whole of Europe. The configuration is irregular and the surface highly diversified, reaching from 100 feet below the sea-level to an altitude of from 5,000 to 8,000 feet in Mount Tusidde. Some of the highest summits are those of the Ahaggar, a great mountain plateau. Air or Asben is an isolated mountain, midway between Tibesti and the Niger. Farther south is the extensive plateau of Adghagh. At the northeast in Fezzan are the dark mountains of Jebel es Sôda. The rest of the Sahara consists generally of undulating rocky surfaces and sand dunes interspersed with occasional oases. The date-palm flourishes on these green spots, also the olive tree. Apples, peaches, oranges, grapes, etc., grow and wheat, barley, rice, durra and other tropical crops are raised, and there is a considerable variety of flora. Mammals consist, outside of the domestic animals, such as camels, asses, black cattle, etc., of 15 species, comprising the jerboa, fox, jackal, baboons, hyenas, mountain sheep, etc.; about 80 species of birds, among which is the ostrich. There are also tortoises, lizards, chameleons, serpents, such as the python, horned viper, etc. The edible frog and fish also occur. There is an important trade in silk tissues and mixed goods, ivory, ostrich feathers, guma, spices, musk, hides, gold dust, indigo, cotton, palm oil, kola nuts, silver, dates, salt, and alum. The exports are textiles, weapons, gunpowder, etc. Many thousand tons of phosphate are extracted. The range of temperature is very great. The chief centres of population are the oases. The inhabitants consist of Moors, Tuareg, Tibbu, Negroes, Arabs, and Jews; the former occupy the region between Fezzan and Lake Tchad. The tribes south of Algeria and Tunisia. The Tuareg control the principal caravan routes. The Tibbu, who number about 200,000, live in the oases between Fezzan and Lake Tchad. The tribes of the desert are, generally speaking, camel drivers, slave and salt dealers, guides, and robbers. A few possess date-groves, but they usually subsist on the milk of their herds, bartering for fruits or grain. The principal caravan routes lead from Timbuktù to the Wady Draha, and to the oasis of Twat; from Haussa by Air or Asben and Ghat to Ghadames and Murzuk; from Bornu by Bilma and Murzuk to Tripoli; from Waday by Ojariga, Kufara, and Aujilah to Benghazi, and from Darfur to Siut. Pop. about 2,000,000.

**Sahāranpur**, *sa-hār-an-poor'*, or **Seharun-poor**, *st-hār-ān-poor'*, India, (1) capital of a district of the same name, in the United Provinces, 90 miles northeast of Delhi. It is an important railway junction. Among the buildings the most noteworthy are an old Rohilla fort (used as a court-house), and a fine Mohammedan mosque. The residential part is substantial and modern. There is a church, an American Presbyterian mission and a fine botanical garden for experiments in tea and cinchona. Commerce in grain, sugar, molasses

and country cloth is considerable. Pop. about 70,000.

(2) The district in the Meerut division has an area of 2,242 square miles, and occupies an alluvial table-land between the Ganges and the Jumna. It consists partly of wild, picturesque broken ground, but the larger portion is tillable. Cereals form the chief products, and its commercial importance is considerable. Pop. about 1,200,000.

**Sahib**, *sā'ib*, the term of native address in India toward a respectable European. It is an Arabic word, signifying companion or lord. The feminine form is *Sahiba*.

**Sai**, *sā'i*, a Brazilian native name of indefinite application for a local monkey, most often, perhaps, designating the capuchin (*Cebus capucinus*).

**Said Pasha**, *sā'id pāsh'a*, Turkish statesman: b. 1835; d. Constantinople, 29 Oct. 1907. He commanded an army corps in the Russo-Turkish war, became governor of Cyprus, and was later appointed secretary of state. He was premier 1870-82, was grand vizier 1882-85 and was twice dismissed but reinstated by the sultan in 1883. In 1885-95 he was minister of foreign affairs, and subsequently president of the council of ministers.

**Saiga**, *sā'ga*, an antelope (*Saiga tatarica*) found on the steppes of Russia and in western Asia. It is about 2½ feet high at the shoulders, pale bluish gray in color, and is remarkable for the greatly swollen appearance of the nose, due to the thick cartilaginous coverings of the nostrils. It once had a far wider habitat in Europe, and is steadily diminishing in range and numbers.

**Saigon**, *sā'gon* (Fr. *sā'gôn*), or **Sai-gun**, Indo-China, the capital of Lower Cochinchina before the French conquest, is on the right bank of the Saigon or Dow-nal River, 24 miles from the sea. The town was nearly destroyed by the French, and the present city dates practically from 1861. It has fine public buildings, modern shaded streets, and zoological and botanical gardens; of educational institutions, the colleges of Chasseloup-Laubat and d'Adran are the most important. There is a large floating dock. The majority of the population is Asiatic, the Chinese element predominating. The town has an active trade with China, Siam, Singapore, and Java. Considerable French and English goods are imported. The main exports are rice, cotton, silk and hides. The great market is Cholon, 3½ miles from Saigon. Pop. about 80,000; Cholon, 127,000.

**Sail**, or **Sail-tailed Lizard**, a large agamoid lizard (*Lophurus amboinensis*) of the Philippines, Celebes, Java, and neighboring islands, which takes its name from the tail sail-like crest bone upon the upper surface of the tail of the adult, which is supported by a great lengthening of the spines of the vertebrae of that region; the tail otherwise is highly compressed, long and powerful. This lizard frequently exceeds three in feet in length, is olive-green spotted and marbled with black, and has many curious folds of skin about the neck. It is strong and active and spends much of its time in trees, but when alarmed or chased

## SAIL--SAILING VESSELS

rushes for water, dives to the bottom and endeavors to hide among the stones. It is defenseless and harmless, and its flesh, which is white and tender, is much liked by the islanders.

**Sail.** See **SNAPE**.

**Sailcloth**, a coarse, strong linen, cotton or hempen cloth used in making sails. The best is made of flax, and combines flexibility with lightness and strength. See **SNAPE**.

**Sailfish**, a large predaceous fish (*Istiophorus niger*) of the West Indian and neighboring waters, which is closely allied to the sword-fishes and of the same family as the spear-fishes (*Tetrapturus*). It reaches a length of six feet, has an elongated, much compressed body, covered with elongate scutes, and a powerful, deeply forked tail; while the dorsal fin is, relatively, of huge size and deeply notched outline, well simulating the appearance of a ship under sail as it appears above the water when the fish glides along the surface as it frequently does. The bones of the nose are prolonged into a "sword," not so long as that of the swordfish, but sharper, and an effective weapon in a school of small fish.

**Sailing.** See **NAVIGATION**; **SHIPS**; **SAIL AND STREAM**.

**Sailing Vessels.** The first vessel of which history gives any description is the Ark, as built by Noah. Its proportions possess some interest, because, though not intended for a voyage, it may be inferred that it was constructed to float with as little motion as possible, considering that it "went upon the face of the waters" for about five months. Assuming a cubit to be about 21 inches, its length was 325 feet, its breadth 87 feet 6 inches, and its depth 52 feet 6 inches. Its length is thus seen to have been six times its breadth, which proportion is about an average of all types of vessels. Its draft of water must have varied greatly during the period of its occupation, as 12 months' provisions must have formed a very large proportion of the original weight, and these must have been gradually consumed. It had three decks; but was fitted with neither masts, sails, nor rudder.

**Ancient History.**—The paintings and sculptures, as the early records of Egypt, show regularly formed boats constructed of sawn planks of timber, propelled by numerous rowers, and also by sails. These vessels were long galleys with one mast and a large square sail, which was sometimes of linen and sometimes of papyrus. The Hebrews in the time of Solomon must have possessed vessels of considerable size, as mention is made in the sacred writings of that date of stately ships, and of voyages made to bring trees of considerable size to be used in the building of the temple. The Phœnicians were connected with the Hebrews in their maritime expeditions, and this people appear to have been the most enterprising in navigation of all the nations of antiquity. Herodotus tells us of their feat of circumnavigating the continent of Africa in 604 B.C. They started from the Red Sea, passing Ophir on east coast of Africa, then rounded the Cape, and keeping by the west shore they entered the Mediterranean Sea through the Straits of Gibraltar, and arrived in Egypt in the third

year of their expedition. Little doubt exists of the Phœnicians having been the discoverers of the art of sailing, as their skill in evading Nebuchadnezzar at the siege of Tyre for 13 years, shows that they possessed more than a superficial knowledge of navigation. They were also engaged in concert with other nations in wars with the Greeks; and it was from them the latter nation learned in their conflicts what they knew of ships and navigation. The fact of the Grecian mariners making use of the screw pump to discharge water from their vessels' holds, would lead to the conclusion that their vessels were no mere sloops. An evidence of the want of strength in the construction of these ancient vessels, is the fact of their being bound around the outside with heavy ropes. They were sometimes carried as part of the vessel's outfit, and used as necessity required. Out at sea and in heavy weather, there they were made use of. There were sometimes as many as 8 or 10 bands running fore and aft of the vessel.

**Roman Galleys.**—The Romans in the early stage of their history paid little attention to navigation, until it was forced upon them by the necessity of competing with their rivals, the Carthaginians. The galleys of this period ranged from a single bank up to five banks of oars. The oars in these large galleys were arranged in sets or banks, the number of these could be increased to any extent by giving increased length to the galley. The trireme, or three-bank galley, appears to have been generally open, in the waist where the rowers sat, with decks or platforms at both ends for the soldiers. The galleys of greater size than the three tiers, appear to have been always decked vessels. At the time of the first Punic war the Roman fleet is said to have consisted of 330 vessels, each containing 300 rowers and 120 soldiers. The triremes were each 105 feet long and 11 feet wide, and the quadriremes were 125 feet by 13 feet.

**Merchant Ships.**—It is generally supposed that ships intended only for merchant purposes were first built by the Genoese, and that not until the beginning of the 14th century were sails first used by that people. The fishing boats were the small beginning from which sprang the sailers and the larger sail vessels of a later period. In England, as early as 1344, many vessels of this character were in service. In the middle of the 15th century many large vessels were built in England. Prior to this the compass had come into more general use, and it was now possible to engage in longer voyages. The discovery of America and the passage around the Cape of Good Hope were early fruits of these improvements. The Portuguese employed vessels of small size in their voyages of discovery, but the Spaniards built larger vessels and long maintained a superiority in this respect. England was far behind the Peninsular nations in commercial enterprise at the opening of the 16th century; and at the close of the century the merchant marine was in a very depressed condition. Internal discords had put a damper on the enterprise of the merchants, and as the island was not yet famed for its manufactures, commerce drooped with every disaster to trade. The Dutch had monop-

olized the East Indies trade and Holland bid fair to enrich herself at the expense of her neighbor. The British East Indies Company was formed, vessels built for the trade, and the merchants again prospered. (See SHIP.)

**The First American Ships.**—This continent having been fitted by nature in supplying it with an abundance of good timber, vessels have been built upon our shores from the first year of actual settlement. The first ship constructed was for the purpose of carrying a small band of settlers back to England, who were discouraged with their prospects after the first winter. The vessel was built at the mouth of the Kennebec River in Maine. It was a staunch and excellent little vessel, a two-master, named *Virginia*. She is believed to have been about 60 feet long and 17 feet beam and 10½ feet deep. The next vessel built was at New York in 1614 or 1615 by Captain Adrien Blok, who had lost his ship *Tiger* by fire while lying at Manhattan River. His new vessel was named *Onrust*, or *Restless*, and was 38 feet keel, 44½ feet long over all, and 11 feet beam. This vessel was employed for several years in exploring the Atlantic coast from the 38th to the 42d degree of latitude. Block Island was visited during one of the excursions, and took its name from Adrien Blok. With the exception of fishing boats and shallops, there is no record of the construction of any other boats until 1631. In that year the bark *Blessing of the Bay* was launched at Medford, Mass., for the use of the Massachusetts colony. In the course of the season this vessel made several coasting trips, and soon after visited Manhattan Island and Long Island. It is thought the vessel was lost with a load of furs and fish in 1633 off the capes of Virginia.

**Early Shipbuilding.**—Shipbuilding at this time appears to have received its first impulse from the same cause which threw the colonists upon their own resources for the supply of many of the necessities of life. They had been hitherto supplied with all but their corn and fish, by the many emigrant ships which had yearly added to their numbers. A suspension of this emigration was brought about by the civil wars in England, and the diminished intercourse caused thereby left them dependent on mercantile enterprise alone, which the state of navigation then rendered precarious in the extreme. Governor Winthrop then said, "The general fear, of the want of foreign commodities, now our money was gone, and things were like to go well in England, set us on work to provide shipping of our own: for which end Mr. Peter, being a man of very public spirit and singular activity for all occasions, procured some to join for building a ship at Salem of 300 tons, and the inhabitants of Boston, stirred up by his example, set upon the building of another at Boston of 150 tons. The work was hard to accomplish for want of money, etc., but our shipwrights were content to take such pay as the country could make." He speaks in another place of the *Trial* of 160 tons, as the first ship built at Boston. She sailed for Bilbao on 4 June 1642, laden with fish, "which she sold there at good rate, and from thence freighted to Malaga." Thus

early began the profitable trade to distant ports from New England. An early and successful prosecution of the business of shipbuilding could have been more reasonably expected of none of the first colonists of America, than of the settlers of Manhattan. Holland was at that period, and long after, in the enjoyment of the carrying trade of the world. Though not possessed of a foot of timber, she built and armed more ships than all the rest of Europe. Planted by this commercial people, and by merchants and capitalists of Amsterdam, then the mercantile metropolis of Europe, exclusively for the purposes of trade, it appears somewhat surprising that the facilities afforded by the new territory for shipbuilding were not made available to a greater extent by the parent nation. But the administration of a privileged mercantile association, such as the West India Company, which, in 1621, was invested with a monopoly of its trade, was unfavorable to the development of the resources of the colony. About 1630 the carrying trade between Holland and America, and the trade with Brazil, where the company had sustained losses equivalent to "one hundred tons of gold," were thrown open to the colonists, and private ships were for the first time entered at Amsterdam, and publicly advertised for New Netherlands. Other restrictions, which had fettered commerce, were soon after removed, and the trade of the world with the exception of that to the East Indies, and the trade in furs, were open to the colonists. In 1678 the shipping owned in the port consisted of three ships and fifteen sloops, and other small sailing vessels. In 1694 the shipping had increased to 60 ships and 102 sloops. This was on account of a monopoly of exporting flour and biscuits from the province. South of New York during colonial times, there was little or no construction of vessels. New England developed her large shipping interests through the fisheries, that were at her door, and the coasting trade maintained by the latter extended as far south as the West Indies during these early days. It might be said the fisheries were the cause of the large merchant marine of New England.

**The Schooner.**—In 1745 Andrew Robinson of Gloucester, Mass., built a vessel with a square stern, which was fitted with two masts, bearing a sloop sail on each, and a bowsprit with jib. She was sharp on the bottom, and on being launched, sped over the water so fast from the impetus gained by descending from the ways as to elicit from a bystander the remark, "See how she scoons." Scoon was a word used by plain people to express the skipping of a flat stone over the surface of the water when skillfully thrown; and the builder of the vessel, having been somewhat at a loss for a name for the new rig, seized upon the trifling incident and replied, "A scooner let her be," and two-masted vessels, with jibs, and fore and aft sails have since been called by that name. This vessel was probably used in the fisheries. The largest schooners were those sent to the Grand Banks, and for many years after 1800 about 70 sail vessels were sent annually to the Grand Banks, chiefly from Cape Ann. These early vessels were from 20 to 40 tons.

**Colonial Merchant Marine.**—Before the Revolutionary War our merchant marine was

THE FIRST SEVEN-MASTED STEEL SCHOONER.

Length, 395 feet; Beam, 50 feet; Molded Depth, 34 feet 5 inches; Displacement, 10,000 tons; Cargo Capacity 7,500 tons; Total Sail Area, 40,617 square feet.

## SAILING VESSELS

in a prosperous condition, and took nearly first rank with us. By 1760 from 300 to 400 trading vessels were being built annually in the different provinces. During the War of the Revolution the whaling and fishing fleets were almost annihilated by raids on the coast towns, by English cruisers. Foreign trade in our vessels suffered the same fate. A large part of the merchant and fishing fleet was employed during the war in privateering, and it became a profitable field for them at times, as small armed sloops frequently captured a large merchantman with the British flag. The larger privateers built during the war, when the conflict was over, were converted into merchantmen, and sent to the East Indies to trade. The Baltimore built schooner took high rank as a privateer during the war. The 16 years that followed ending with the War of 1812 were perilous times for American shipping. England excluded us from a profitable trade with the British West Indies, and the same interests led to the searching of our merchant vessels for British subjects, the capture and confiscation of our vessels and cargoes, and a detention of a large number of them for evasions of the British law. Then came on the War of 1812 that lasted for nearly three years, during which many privateers were constructed that subsequently pursued the peaceful pursuit of trade. A change in the form of our sailing vessels now began to appear, giving them better entrance lines, and cutting off those high poop decks that had been such a fixture on large vessels for many years, being among several changes that were made.

**The Carrying Trade.**—Prior to the War of 1812 our coastwise trade was carried on by no larger sailing vessels than those that were schooner rigged, while our foreign trade was most largely carried on in foreign bottoms. Before 1812 a few sailing packets, or vessels carrying both passengers and freight, were brought into the transportation business, and cleared from port on regular days in each month, and were operated between special points only. When the war ended there were only a few small British ships in the packet service between England and America, and very few between America and other parts of the world. Soon after the peace, however, a large number of lines came into existence as a natural outgrowth of the rush of emigration from Europe to America, and the general expansion of ocean travel and trade. The carrying of passengers was a profitable business, and there was considerable competition among shipping merchants to get the most business for their vessels. None but the best and finest vessels could be used in this trade, and the old-fashioned freighting vessels with their small cabins and houses, and poop decks, were subjected to many changes to adapt them to the passenger business. The merchants at most all our coastwise ports, from Portland, Maine, to New Orleans, La., soon saw the advantage of these packets for our coastwise trade, and regular established lines were soon in operation that remained as carriers until the coastwise steamship lines began operations in 1847, when these lines of sailing vessels gradually withdrew from business. In this trade brigs, schooners, and barks were used, while in the foreign service ships and barks only were placed in service.

**Packet Lines.**—It was at New York the packet business between Europe and America mainly centred. There were lines from other ports, but New York was the pioneer, always kept the lead, and had the largest number and finest vessels for the service. In 1816 Isaac Wright & Co., of New York, founded the famous Black Ball Line, so called from the round black dot in a white field, which was adopted as the pennant of the ships. There were at first four vessels in this line, each of 400 to 500 tons, and named "Pacific," "Amity," "James Cropper," and "William Thompson." This line was subsequently owned by Goodhue & Co., Charles H. Marshall, and others. They were placed in the Liverpool trade, and sailed once a month at first, and during the first nine years the average time in voyages to Liverpool was 23 days, and for returning home 40 days, but one of the later ships, the Canada, once made the outward voyage in 15 days and 18 hours. A London line followed the Black Ball line, and then a Havre line was started. In 1821 a second Liverpool line was established from New York by Byrnes, Trimble & Co., known as the Red Star line, consisting of the Manhattan, Hercules, Panther, and Meteor, sailing once a month, and soon after Fish, Grinnell & Co., afterward Grinnell, Minturn & Co., founded the Swallow Tail line with four packets, making from New York at this time one sailing for Liverpool each week. In 1830 the passenger fare in the cabin from Liverpool was \$180, including beds, bedding, wines and stores of every description. The London packets now sailed twice a month, and the Havre line had three sailings a month. There were also at this time sailing packets to South America and Mexican ports. In 1830 there were 1,510 arrivals at New York from foreign ports, of which 382 were ships, 26 barks, 714 brigs, 376 schooners, 8 sloops, 1 ketch, and 1 felucca. Of these 1,366 were American, 92 British, 7 Spanish, 12 Swedish, 2 Hamburg, 5 French, 8 Bremen, 6 Haitian, 9 Danish, 2 Brazilian, 2 Dutch, and 1 Portuguese. The number of arrivals in 1839 was 1,310, and passengers, 16,064. In 1823 John Griswold established a London line of four vessels, that had been increased by 1837 to 12 vessels. These vessels down to 1845 were one- or two-decked vessels, and had increased in size to 900 or 1,000 tons. The between deck space, aft, was divided into cabins for the passengers, the middle portion was fitted up with kitchens, pantries, etc. The steerage passengers and crew were placed forward. After 1830 there were frequent sailings of rival packets, transient, but all American, from Boston, New York, and Philadelphia to Great Britain and other parts of Europe. All the ships sailed with great speed, and made the run across the Atlantic in excellent time. The Red Jacket once ran from New York to Liverpool in 13 days 11½ hours. The Mary Whitebridge made the voyage from Baltimore in 13 days 7 hours; but the usual time was 19, 20, or 21 days to Liverpool, and from 30 to 35 days homeward. English steamers were sent out in 1836 and 1840 to compete with these packet lines; but the steamers did not at first make much better average time on a voyage than the packets, but in the course of a few years the increase in speed and their additional carrying capacity

## SAILING VESSELS

gave them an advantage, and the packets could no longer successfully compete with them.

**Clipper Ships**—After the packets came the clipper ships, vessels intended primarily for freighting, and built to secure the highest possible speed when laden with cargo. The packets were the fast sailers from 1816 to 1845, but after the latter date there grew up various branches of trade in which a quick delivery was as important for commercial purposes as it was for the passenger trade. For instance there was the tea trade from China to the United States, in which speed has always been considered essential. The cargoes consisted of teas, spices, coffee, dried fruits, etc., which were liable to deteriorate in a long voyage of four months to the home port, and to shorten the voyage as much as possible was desirable for many reasons. There were no telegraph lines and ocean cables in those days, and the uncertainty of the markets made fast trips home from the East Indies very important. Merchants had repeatedly suffered heavy loss, sometimes business ruin by the decline in eastern goods brought home by ships during their absence on the voyage out and back, and good ships were therefore always required in that trade. The first clippers were built at New York. The pioneer was the *Helena*, built by William H. Webb, whose dimensions were 135 feet length on deck, 30 feet 6 inches beam, and 20 feet depth of hold. She came out in 1841, and was constructed for A. and N. Griswold for the China trade. She was a good sea boat and a very fast sailer for her day, making many fast voyages between China and other East Indian countries, and New York. Following the *Helena* came the *Rainbow* of 750 tons, built by Smith and Dimon in 1843 for Howland and Aspinwall. This vessel made the voyage to Canton and return home in six months and 14 days, having spent three weeks of the time in loading and discharging cargo. The *Helena* and the *Rainbow* brought about a great change in this type of vessel. They commanded better prices for freights than slow ships, and in every way proved desirable. Then in 1844 followed the *Montauk* of 540 tons for William S. Wetmore, built by William H. Webb. Then A. A. Low & Co. had Brown & Bell construct for them the *Howqua* of 706 tons, a very fast and fine vessel, which made a voyage from Shanghai to New York in 87 days. The owners of the *Rainbow* then had the noted clipper *Sea Witch* built of 907 tons by Smith & Dimon, with the intention to have the fastest vessel of the type afloat. This vessel had finer under water lines than her predecessors, and may be said to have been the first of that advanced type of fast clipper ships. She made one voyage to California in 97 days. The era of fast clipper ships was now fairly inaugurated, and many of this class were now built not only at New York, but at Boston, Philadelphia, and Baltimore. Nearly all the early ones did not exceed 1,000 tons register, or about 165 feet long, but competition led to a great increase in size, and every year saw vessels launched that spread more and more canvas, longer, larger, and faster than ever, and expressly intended to excel everything that had preceded them in the merchant shipping of the world. In 10 years after the first clipper ship

the size of 2,400 tons was reached, and there were many built of 2,000 tons each.

**British Rivalry**—Foreign merchants were by no means idle spectators of what was going on in this country, and in 1846 England began to awake to the new and dangerous rivalry from America. Alex. Hall & Co. of Aberdeen made a specialty of clipper ships, and there were launched from their yard many superior and famous vessels. But the Americans, though hard pressed, were able to maintain the lead, and entitled to the best record ever made by ships sailing under canvas. There were several famous races home from China. Once the British clippers *Chrysolite* and *Stornaway*, and the American clippers *Race Horse*, *Surprise*, and *Challenge* engaged in a race from Canton to Liverpool and Deal, and arrived at the home ports as follows: At Liverpool, *Chrysolite* in 106 days; at Deal, *Stornaway* in 109 days; *Challenge* in 105 days; *Surprise* in 106 days. The British ship *Challenge* ran from Shanghai to Deal in 113 days, and the American clipper *Nightingale* in 110 days. These races were claimed by both parties; but the Americans kept the reputation of superiority, and several ships were ordered at our ship yards for foreign account. Then shortly after the gold fever broke out in California, and the John Bertram of 1,100 tons was built at Boston, Mass., and sent to the Pacific coast in 1850 by Boston parties. This was the first clipper ship built for the California trade. The *Witch of the Wave* and four others of 1,500 tons each, were immediately after built for the same parties.

**Sailing Speed**—The speed of the clippers was remarkable. Six miles an hour was a good average rate of speed for long voyages, and nine miles an hour excellent time, especially for a ship loaded with a full cargo of merchandise. Clippers ran across the Atlantic to Liverpool at an average speed of nine miles an hour, spurring at the rate of from 10 to 13 miles with a favorable wind, and on voyages that gave them the advantage of the trade winds they ran for days and weeks in succession at an average speed of from 12 to 15 miles an hour. To sail 300 miles a day was not exceptional. The largest of them all was the *Great Republic*, built by Donald McKay in 1853 at East Boston. The length on load line was 314 feet, beam molded 49½ feet, molded depth 38 feet. One of the noted clippers of the day was the *Dreadnought* built in 1853 at Newburyport, Mass. In 1859 she made the voyage from Sandy Hook to Liverpool in 13 days and 8 hours, and in 1860 from Sandy Hook to Queens-town in 9 days and 17 hours. After 1860 there was no longer any necessity for great size and speed in this type of vessel. Too many ships had been built, and a reaction set in that lasted for many years. By 1857 there were from 80 to 100 large ships in the California trade, and the rates of freight fell off one half, and the ships were thrown into the general trade of the world. In the next place, steam vessels, about 1852, had been built to run on all the principal ocean routes, and there was no longer any need for sailing vessels to be fitted out with large cabins and roomy passenger accommodations. This ended the career of those fast clipper ships that had such a world-wide reputation from

## SAILOR'S CHOICE—SAILOR'S CREEK

1850 to 1860. Then the Civil War came on, and our foreign trade was cut off for four years. After 1865 the grain trade attracted the larger sailing vessels. This type of vessel was no longer an extreme clipper of the former period, but a handsome, medium clipper, of about 2,000 tons register, capable of carrying a large cargo at a fair rate of speed. These vessels continued in the Atlantic-Pacific trade until the American Hawaiian Steamship Line commenced operations, in 1900.

**Modern Schooners.**—The schooner, as previously mentioned, was the product of a comparatively early date. It was largely used in the coastwise trade, to the West Indies, to South America, and later to Africa, and it may be said has not fallen from favor even to this day. The early vessels were not over on an average, 75 tons. When it became necessary to increase the tonnage of the vessel it was thought to be advantageous to increase the power, so three masts were adopted. The earliest date of the building of a three-masted schooner in this country is thought to be about 1831. There were a few more built about 1845, and in 1847 the *Midas* was converted into a three-masted schooner, the *Zachary Taylor* was built at Philadelphia in 1849, and the *Spray* at Wilmington, Del., the same year. The period when this type of sailing vessel had passed the experimental stage appears to have been in 1853 when there were built the *Gardner Pike*, the *James H. Chadbourne*, the *Kate Brigham*, and the *E. R. Bennett*; and in 1855 the *Eckford Webb*, and the *William L. Burroughs*; and in 1856 the *Hartstein* and the *Cordelia*. The two latter were two-deck vessels, and were the largest of the type built for some years. These vessels were used mainly in our coasting trade, as far south as the Gulf of Mexico ports. There were a few more built prior to 1860; the Civil War came on when but few, if any, were built. It was 1868 before three-masted schooners were again constructed, and by 1873 they were the most popular type of our coastwise sailing vessels. The first four-masted schooner was the *William L. White* built at Bath, Maine, and completed in June 1880. The Northern lakes also had four-masters immediately after the *William L. White*. Then it was some years before the pioneer five-master was constructed in 1888 at Waldoboro, Maine, as the *Governor Ames*. The latter was the largest schooner for 13 years, until the *George W. Wells* was built in 1900 as a six-masted schooner. The largest of them all is the *Thomas W. Lawson*, built of steel in 1902, as a seven-masted schooner.

**Iron Hull Ships.**—The first iron hull sailing vessel constructed in the United States was the schooner *Mahlon Betts* of 275 tons, built in 1854 at Wilmington, Del. Then there were none but wooden sailing vessels until the brig *Novelty* was built at Boston, Mass., in 1868, and the bark *Iron Age* constructed in 1869 for *Tupper & Beattie* of New York. The sloop yacht *Vindex* was then built in 1871 at Chester, Pa., by *Reanie Son and Archbold*; and in 1879 the yacht *Mischief* was built at Wilmington, Del. The three-masted schooner *Josephine* followed in 1880, being built by *William Cramp & Sons Co.* Then there came such larger vessels in

the *Tillie E. Starbuck*, built in 1883 by *John Roach & Son* at Chester, Pa.; and in the same year by *Gorringe & Co.*, as the *American Ship-building Company*, the *T. F. Oakes*. These vessels were about 2,000 tons register each. See also **NAVAL CONSTRUCTION**; **SHIP-BUILDING**.

J. H. MORRISON,

*Author of 'History of American Steam Navigation.'*

**Sailor's Choice**, the name of several excellent food fishes taken on the eastern and south-eastern coasts of the United States, which are of small size and belong to the family of grunts. The best known, probably, is *Orthopristis chrysopterus*, also called pigfish, and especially common in the Gulf of Mexico, which is regarded as the best pan-fish of the region.

**Sailor's Creek, Battle of**, the last great battle of the Civil War in the East. Sheridan says that it was "one of the severest conflicts of the war . . . so overshadowed by the stirring events of the surrender, three days later, that the battle has never been accorded the prominence it deserves." When Gen. Lee abandoned Richmond and Petersburg on the night of 2 April 1865, he ordered the concentration of his army at Amelia Court House, about 30 miles west of Petersburg, and it had collected at that point by noon of the 5th. On the night of the 5th Sheridan's cavalry and the Second, Fifth, and Sixth corps of the Army of the Potomac were at or near Jetersville, under orders to march early next morning on Amelia Court House. Gen. Meade began the advance at 8:30 A.M. and when four miles out of Jetersville, Humphreys' Second corps, on the left, discovered that Lee was moving westward, passing by the flank of the Union army. The advance on Amelia Court House was suspended, and the army faced about; the Second corps was ordered to move on Deatonville; the Fifth through Painesville, on the right of the Second; and the Sixth through Jetersville to the left of the Second. Sheridan's cavalry moved on the extreme left parallel to the Confederate line of retreat, impeding the march of the column wherever practicable, but Longstreet's corps succeeded in reaching Rice's Station, on the Lynchburg road, where he awaited the corps of R. H. Anderson, Ewell, and John B. Gordon, the last-named commanding the rear-guard. The Second corps was checked at Flat Creek by the destruction of the bridge, but, soon repairing it, overtook Gordon and kept up a running fight with him for 14 miles, carrying several lightly entrenched positions, and capturing prisoners, colors, and wagons. The pursuit continued to Parkinson's Mill, on Sailor's Creek, where Gordon made a stand, but was soon driven across the creek, losing three guns, 13 colors, several hundred prisoners, and a large part of the trains of Lee's army. He attempted another stand beyond the creek, but fell back as Humphreys crossed, and marched for High Bridge. Pursuit ended at night. During the day the Second corps had captured 1,700 prisoners, four guns, 13 colors, and several hundred wagons and ambulances. While the Second corps was engaging Gordon, the Sixth corps, with the cavalry commands of Merritt and Crook, had come up some three miles to the left and overthrown the corps of R. H. Anderson and Ewell. Custer's division had interposed between Ewell and

## SAILOR'S SNUG HARBOR—SAINT

Gordon, destroying 400 wagons and taking prisoners and 16 guns; and Crook, moving rapidly to the left, found R. H. Anderson's command posted on high ground behind breastworks running across the Rice's Station road, and sent a dismounted brigade to take possession of and form across the road, thus cutting Anderson off from Longstreet. Ewell now proposed to Anderson that they make their way through the woods, around Sheridan's left, and get to Longstreet; but before anything could be done both were attacked. The Sixth corps had opened its artillery upon Ewell's 3,600 men, to which there was no reply, as Ewell was without artillery; and about 5 p.m. two divisions advanced, crossed Sailor's Creek, and attacked Ewell, who made a most determined resistance and, massing his troops, broke the centre of the Union line, but was checked by the artillery-fire from beyond the creek. The two divisions of the Sixth corps—Seymour's and Wheaton's—wheeled to the left and right respectively, enveloping Ewell's flanks; Stagg's cavalry brigade charged his right; and at the same time Merritt's and Crook's cavalry charged and routed R. H. Anderson's 6,300 men, killing, wounding, and capturing about 2,600. Ewell, now completely cut off and surrounded, surrendered his entire command. About 250 men of Kershaw's division, serving with him, escaped. Seven general officers were included in the surrender. The total loss of Lee's army was not less than 8,000 men. The Union loss did not exceed 900. Longstreet, who had remained at Rice's Station during the day, waiting for Anderson, Ewell, and Gordon, to unite with him, marched as soon as night set in, with Fields', Heth's, and Wilcox's divisions, for Farmville. (See FARMVILLE AND HIGH BRIDGE.) Consult: 'Official Records,' Vol. XLVI.; Humphreys, 'The Virginia Campaign of 1864-5'; Walker, 'History of the Second Army Corps'; Grant, 'Personal Memoirs,' Vol. II.; Sheridan, 'Personal Memoirs,' Vol. II.

R. A. CARMAN.

**Sailors' Snug Harbor**, a home for aged sailors on Staten Island, N. Y., established by Captain Richard Randall in 1800. The home is under government supervision and is in charge of a naval commander.

**Sainfoin**, *san'foin*, or *Asperuget*, a leguminous plant (*Onobrychis sativa*), originating in the Mediterranean countries, but which has been cultivated for centuries. The stem is about two feet high, with pinnate leaves, composed of small leaflets; the pea-like flowers are rather large and of a showy pink color, and are disposed in short spikes, on long axillary peduncles. It is a nutritious fodder, well liked by live-stock, especially sheep, makes good hay, and will grow on light, warm, chalky soils, where other pasturage does not thrive; the roots are long-lived and are useful for binding light soils, while the foliage not only shades the pastures, but makes a good crop for plowing under. It is also recommended as a honey-producing plant for bee pastures.

**Saint**, a person eminent for piety and other virtues. In the books of Scripture, both the Old and the New Testament, the whole body of the faithful people are called saints (2 Chron. vi. 41; Ps. xxxi. 3; Hebr. xiii. 14, "Salute all the saints"; Eph. i. 1, "the saints at Ephesus.") It is customary to give the title

saint to all the apostles, evangelists and other holy persons, men and women, named in the New Testament, to most of the Fathers of the Church, to all the martyrs. In the Church of Rome the title of saint is formally and authoritatively bestowed on servants of God who in their lifetime were eminent for their Christian virtues and graces, and whose sanctity has been proved by miracles after their death (see CANONIZATION; BEATIFICATION); but thousands of saints are honored by that church, who lived in early times before the process of canonization was thought of. Intercession by the saints in heaven and Invocation of the Saints are articles of belief in the Catholic Church, Eastern and Western, as also in the schismatical eastern churches; but that doctrine is repudiated by all the Protestant churches. The teaching of the Church of Rome, as proclaimed by the Council of Trent, is that the saints reigning with Christ "offer to God their prayers on behalf of men"; that it is good and useful "to call upon them with supplication," and, in order to obtain benefits from God through Jesus Christ, "to have recourse to their prayers, help and aid"; here the church's doctrine regarding both intercession and invocation of saints is defined. Catholic divines find full warrant for this belief in the Christian sacred books; for the doctrine of intercession, in 1 Cor. xii. 12, where the unity of the Christian society is enforced; in James v. 16, where the prayer of the righteous is lauded; in Eph. vi. 18, and 1 Tim. ii. 1, where Saint Paul sets such store on the prayers of his fellow Christians; and it is asked, Can it be that the souls which have gone to God no longer exercise this kind of charity for their brethren on earth? If Scripture were silent on this question, the practice of the Church in all ages would suffice to remove all doubt as to the Apostolic origin of the belief in the intercession of saints. For the doctrine of the invocation of saints, theologians quote the word of Jesus Christ, that the angels in heaven rejoice when a sinner repents of his sin (Luke xv. 7); it were superfluous to cite the usage of the Catholic Church regarding invocation of saints; it began with the beginning of Christianity itself.

**Saint Albans**, *Albanz*, England, in Hertfordshire, 20 miles northwest of London, an ancient borough and market-town, standing on a height above the river Ver. Its abbey is one of the most remarkable Christian temples in England. Only a gateway remains of the original abbey, built in 796, in honor of Saint Alban, the first British Christian martyr. The present abbey has been so often extended and altered that it represents in its architecture many styles and various epochs of history, from the time of the Romans to that of Henry VII. It has the form of a Latin cross, with a length of 547 feet, and breadth of 206 feet. Its tower has an elevation of 146 feet, crowned with battlements. Other churches are Saint Michael's 10th century; Saint Stephen's, with some good Norman features, and Saint Peter's, whose nave is of the Early Perpendicular. There is an Edward VI. grammar school, and of modern buildings those deserving notice are the corn exchange, court-house, prison, baths, and public library, besides benevolent institutions, including hospital and almshouses. The chief industries are silk manufacture, straw-plaiting, and there are breweries and iron foundries. Two battles were fought between the houses of York and Lancaster, near Saint Albans; in that of 1455 Richard, Duke of York, defeated Henry VI., and in 1461, Margaret of Anjou, defeated the army of York, commanded by Warwick. Southwest of the present city stood the ancient Verulamium, one of the oldest towns in Britain, on Watling Street. In the abbey the printing press was set up on which the first English translation of the Bible was printed. Nicholas Breakspear, the only English pope, was born near Saint Albans. Pop. about 17,000.

**Saint Albans**, Vt., city, county-seat of Franklin County; on the Central Vermont railroad; in the northwestern part of the State, about 60 miles north-northwest of Montpelier, the State capital, and three miles from Lake Champlain. It was settled in 1763 and chartered as a city in 1897. In 1864 the town was raided by a band of Confederates who entered the United States from Canada. In 1866 a number of Fenians who were planning an invasion of Canada, made Saint Albans their headquarters.

The city is on a plain about 390 feet above sea-level and 373 feet above lake-level. The scenery is most pleasing; to the east are the Green Mountains, and on the west may be seen the Adirondacks. The city is in an agricultural region in which considerable attention is given to dairying. The chief manufacturing establishments are creameries, railroad shops,

machine shops, and flour and grist mills. There are large shipments of farm and dairy products. Saint Albans contains the Warner Hospital, the Warner Home, Villa Barlow Convent, an academy; Saint Mary's Academy, public and parish elementary schools, and a public library. Pop. (1890) 7,771; (1900) 6,239. Since 1890 a part only of the town has been chartered as a city. The population is, according to the 1910 census, 6,381.

**Saint Albans** (Vt.), Confederate Raid on, a foray made 19 Oct. 1864, when Lieut. Bennett H. Young, with about 25 Confederates, nearly all of them escaped prisoners, armed with revolvers and carrying chemical preparations with which to set fire to town and farm-houses, crossed the Canada line into the town intending to burn it and rob the banks. Several citizens were killed or wounded, and three banks robbed of \$150,000. An attempt to burn the town failed because of the defective character of the chemical preparations. Young and his party remained in town less than an hour, when they rode back to Canada on horses they had seized. Pursuit was made by United States troops, who captured some of the men on Canadian soil and turned them over to the authorities, by whom they were released on the technical ground of want of jurisdiction.

**Saint Andrews**, *Sn'drooz*, Scotland, an ancient city of Fifeshire, on the North Sea, 11 miles southeast of Dundee and 31 miles northeast of Edinburgh. It was created a royal burgh by David I. in 1140, and after having been an episcopal see became an archiepiscopal see in 1472; it was long the ecclesiastical capital of Scotland. The ruined cathedral was begun in 1160 and took 157 years to finish. The old castle, also in ruins, was founded about 1200, and rebuilt in the 14th century; in it James III. was born, Cardinal Beaton assassinated, and in front of it George Wishart was burned. Saint Andrews was a celebrated educational centre as early as 1120; its university, the first in Scotland, dates from 1411; it consists of the united colleges of Saint Salvator and Saint Leonard and the college of Saint Mary, both at Saint Andrews, and embraces also University College, Dundee, founded in 1880. The united college of Saint Salvator and Saint Leonard has a principal (also principal of the university) and 11 professors, and the college of Saint Mary has a principal and three professors. Degrees, open to women as well as men, are conferred in arts, divinity, science, medicine, and law, much as in the other Scottish universities; and the university also confers the diploma and title of L.L.A. (Lady Literate in Arts). The number of students is about 250. In connection with the university is a library containing about 100,000 printed volumes and 150 MSS. The university unites with that of Edinburgh in sending a member to Parliament. Madras College or Academy, founded by Dr. Bell of Madras, the principal secondary school of the place, provides accommodation for upward of 1,500 scholars. Saint Andrews is a popular watering place and summer resort, and the headquarters of Scottish golf, its links being famous. The manufacture of golf clubs and balls is a thriving industry.

## SAINT ANDREW'S CROSS — SAINT AUGUSTINE

**Saint Andrew's Cross.** See Cross.

**Saint Angelo Castle,** Rome, Italy, a famous fortress situated on the right bank of the Tiber in the northwestern part of the city, opposite the bridge of Saint Angelo, and a short distance from the main buildings of the Vatican. It was built by the Emperor Hadrian as a tomb for himself and his family. Originally it was a round stone tower covered with marble and surmounted by a number of statues, which, together with the marble covering, have disappeared, leaving the bare stone structure. When the Goths besieged Rome it was used as a fortress, and has served this purpose ever since, being held and garrisoned by the party in power in the city. Since the time of Innocent III. it has belonged to the popes, who strengthened the fortifications with outworks, and connected the castle with the Vatican by an underground passage.

**Saint Arnaud,** *sān-tīr-nō*, Jacques Leroy de, French soldier: b. Bordeaux, France, 20 Aug. 1796; d. at sea 29 Sept. 1854. He entered the French army in 1813, but in 1822-31 was engaged with the Greeks in their struggle for independence. He returned to the French army in 1831, and in 1837 he went to Algeria, where he rose to the rank of *maréchal-de-camp* in 1847, and general of division in 1851, in recognition of his successful warfare against the Kabyle tribes. He was appointed minister of war 26 Oct. 1851, was active in promoting the *coup d'état* of 2 December, and was made a marshal of France in that month. He was placed in command of the French forces in the Crimean war and co-operated with Lord Raglan at the battle of Alma, 20 Sept. 1854. Consult Duperré Sainte-Marie, 'M. le Général Leroy de Saint-Arnaud' (1852).

**Saint Asaph,** *zā'af*, Wales, an episcopal city in the County of Flint, six miles southeast of Rhyl, occupies an eminence in the Vale of Clwyd, near the confluence of the Clwyd and Elwy. It is built irregularly and has a venerable appearance. The encampment, *Bron-y-Wylva*, on the brow of the hill, is supposed to have been occupied by Roman forces. The cathedral, a small plain structure, dating from 1284, has been restored several times. Its library contains some rare and valuable books. The bishop's palace is modern. The town has a grammar school, founded 1600, county offices, a union workhouse and almshouses. Pop. about 18,000.

**Saint Aubin,** *ān-tō-bīn*, Nicolai de, Danish author, known largely by his pseudonym, 'KARL BERNHARD': b. Copenhagen 18 Nov. 1798; d. there 25 Nov. 1865. He first appeared in literature as a contributor to the 'Flyvende Post,' and finally obtained a large measure of success by his works of fiction, of which several dealt with higher Danish circles in modern times, while others were drawn from events of Danish history. Among the titles are: 'Lykkens Yndling' ('Fortune's Favorite'); 'Krøniker fra Christian den Andens Tid' ('Chronicles from the Time of Christian II', 1847), and 'Krøniker fra Erik af Pomerens Tid' ('Chronicles from the Time of Erik of Pomerania', 1850). A collection of his writings appeared at Copenhagen in 1856-66 (2d ed. 1869-71).

**Saint Aubyn,** *ō'bīn*, Alan, pseudonym of FRANCES MARSHALL BRIDGES, English novelist: b. Surrey. She was the daughter of G. B. Bridges, a dramatist, and was married to Matthew Marshall of Saint Aubyns, Tiverton, Devonshire. Among her very numerous novels may be named 'The Master of St. Benedicts'; 'Broken Lights'; 'A Prick of Conscience'; 'The Junior Dean.' She has also written many juvenile tales such as 'Joseph and His Little Coat'; 'The Dean's Little Daughter'; 'Wapping Old Stairs.'

**Saint Augustine,** *ā-gūs-tēn* or *ā-gūs'tēn*, Fla., city, port of entry, county-seat of Saint Johns County; on the Atlantic coast, about 36 miles south of the mouth of the Saint Johns River. The city is in lat. 29° 48' 30" N., and lon. 81° 35' W. It is on a peninsula formed by the Saint Sebastian River on the south and west and the Matanzas River on the east. It is on the Florida East Coast railroad. The city has many evidences of its ancient fortifications. The residence of the old Spanish governors is now a custom-house and post-office. The principal streets extend north and south. The main thoroughfare, Saint George Street, only 17 feet wide, extends through the centre of the city to the city gateway; but beyond this point it is called San Marco Avenue. Treasury Street, which crosses Saint George, is only seven feet wide at the east end. Of the modern buildings, the hotels are the most beautiful. The Ponce de Leon is of the style of the Spanish Renaissance; the buildings and furnishings cost about \$2,100,000. A pictorial history of Spanish adventure in the New World, especially relating to the history of Florida, is given in the mural decorations of the dining room and loggia.

Saint Augustine was settled 8 Sept. 1565 by Spaniards under Pedro Menéndez de Aviles; but the place had been visited as early as 1512 by Ponce de Leon. For two centuries it remained under Spanish rule, although in 1586 it was plundered by Drake. The population in 1769 was 3,000, besides the garrison of 2,500. It became a British possession in 1763, which it remained until 1783. During the Revolution it was an important military depot. It became again a Spanish possession in 1783 and in 1821 it was ceded to the United States (see FLORIDA). Some of the old buildings of the first Spanish régime are still in existence. The houses were then built chiefly of coquina, a formation found on Anastasia Island, a concrete made of broken shells cemented with shell-lime. The sea-wall, the city walls, and the fort were made of the same material. San Marco, now Fort Marion, is a fine specimen of the knowledge of military engineering of that age. The Government added a water battery in 1842-3, and has made occasional repairs, but it stands to-day about as when built by the Spaniards. It is said to have been built by Mexican convicts and Indian prisoners, and to have been in process of erection for about 100 years. The shaft of marble in the Plaza was erected in 1812-13 to commemorate the adoption of a Spanish constitution which was more liberal than the one under which the city had been governed. The inhabitants were ordered to destroy the shaft when the project failed, but the authorities only removed the tablets which have since been restored. A Roman Catholic Church begun in 1793 and used later as a cathedral, was burned in 1887; but the façade remained almost unin-

## ST. AUGUSTINE

## SAINT BARTHOLOMEW.—SAINT BRANDAN'S ISLE

jured. In rebuilding, this front wall was incorporated into the new structure; and the bell bearing the date of 1682 is also preserved. The only part of the old wall which now remains is the city gateway with about 30 feet of the wall on each side. The wall extended south along San Sebastian River, and from the river to the castle of San Marco (Fort Marion) where were a wall and moat. The old city extended nearly a mile, from the Castle of San Marco to the Franciscan Convent, now Saint Francis barracks, and the old sea-wall, built to protect the city from the sea, was also limited by the castle and the convent. The Government rebuilt the sea-wall in 1827-43, and there is now a granite coping three feet in width. For many years, until 1817, the entrance to the city from the mainland was by means of a drawbridge.

There are a number of manufacturing industries; chief among the establishments are the Florida East Coast railroad shops, which have about 200 employees; printing plant, 75 employees; lumber and wood works, 60. There are engaged in oyster canning and in fishing fully 250 persons. Saint Augustine is a famous winter resort; about 25,000 persons visit the city annually. Two fine hospitals, the Alcaia and the Florida East Coast, several churches, and the municipal buildings are among the principal buildings. The educational institutions are Saint Joseph's Academy, Warden Academy (colored), three public schools (white), two parish schools (white), one parish school (colored), one kindergarten, and one of the 17 best libraries in the United States, entitled to all Government publications free, and a museum of natural history. The one bank has a capital of \$100,000; the annual amount of business is \$1,100,000. The government is vested in a mayor and a council of 10 members, five of whom are elected each year. Pop. (1910) 5,494.

D. E. THOMPSON,  
General Manager 'The Evening Record.'

Saint Bartholomew, bār-thōl'ō-mē, or Saint Barthélemy, sām bār-tāl-mē, West Indies, an island 100 miles east of Porto Rico. It is about eight square miles in extent, of irregular form, and mountainous. Although nearly treeless it is fertile, vegetables are cultivated in some of the valleys, and bananas, cassia, tamarinds, and sassafras are exported. Rocks and shallows make access to the island difficult for any but the larger coasting craft. Lead and zinc ores have been found in the island but are not worked. The principal town is Gustavia, near the port. The island belonged to Sweden, but in 1877 was sold to the French who had previously held it from 1648 to 1748; the people, who had retained French language and customs, desiring it. Slavery was abolished in 1848. Pop. 2,942.

Saint Bartholomew, Massacre of. See BARTHOLOMEW, SAINT, MASSACRE OF.

Saint Bede College, a Roman Catholic institution, in Peru, Ill., opened in 1891, and in charge of the Order of Saint Benedict. In 1902-3 there were connected with the school 18 professors and instructors, 194 students, of whom 774 were in the collegiate department. The courses are preparatory, commercial, and classical. The classical course is intended for those studying for the priesthood or for the professions.

Saint Benedict's College, located at Atchison, Kan. It was founded in 1858 by the Benedictine Fathers. There are two distinct courses offered, the classical and the commercial, the classical course leads to the degree of bachelor of arts, the degree of master of arts is conferred for two years' post-graduate study. The commercial course leads to the degree of master of accounts. There is also a preparatory course provided. There are two scholarships for those who enter the classical course. The college has two distinct libraries, one for the free use of the students, numbering 4,000 volumes in 1904, and one for the special use of the professors, numbering 15,000 volumes in 1910. The number of students in 1909-10 was 245, of members of the faculty, 26; the total number of graduates from the opening of the college was about 400.

Saint Bernard of Clairvaux. See BARNARD, SAINT.

Saint Bernard Dog, a race of large dogs which gets its name from the Hospice of Saint Bernard, where it has long been kept by the monks to aid them in rescuing perishing travelers. This dog is very valuable in assisting the monks to keep to the line of the road and in finding their way back. They are seldom burdened. Dogs of other races are used for the same purpose in other parts of the Alps. The Saint Bernard dog is of two varieties: the first, which has long white hair with black or tawny spots being few in number. This famous dog, according to the traditions of the monastery, is the result of a cross between a Danish bull-bitch and a mastiff, a native hull dog, though at what time effected it is impossible to say. After the breed was once established it was kept pure till 1812. About 1860 these dogs first attracted the attention of English travelers, who imported them to Great Britain, where they were exhibited and at once excited much notice on account of their size and beauty. Others were introduced, and the Saint Bernard was soon established as the most popular big dog, a popularity which has gone on increasing. The Saint Bernard, as bred to modern English ideas, is an immense red or orange colored dog, marked with white on muzzle, neck, chest, feet, and tip of tail. The head should be massive and imposing, with a strong square muzzle, a point of great importance. Legs should be straight, with large feet, and double or, at least, single dew claws. Hind feet should turn out, though not sufficiently to hinder the dog's movements. The coat of the rough variety is of medium length; it should not be too curly. In the smooth variety the coat should be short and wavy. Many of the finest Saint Bernards measure over 30 inches high at the shoulder and weigh over 150 pounds. While most of these dogs are good-tempered, strangers should be cautious in dealing with them, they are very likely to attack and kill small pet dogs, especially fox-terriers.

Saint Brandan's Isle, a legendary island supposed to have existed to the southwest of the Canary Islands and to have been discovered by the Irish monk, Saint Brandan, and 75 brother monks in the 6th century, after seven years spent in search for the land of saints. This legend is traceable as far back as the 11th century. Each of the various early geographers gives it a different location. The legend had some influence upon the discovery of America.

## SAINT CATHARINES—SAINT CHRISTOPHER

**Saint Catharines**, Canada, county town of Lincoln County, Ontario, on the Welland Canal and on the Grand Trunk and Niagara, Saint C., and Tor. railways; 12 miles northwest of Niagara Falls, 32 miles east of Hamilton. Saint Catharines is noted for its mineral wells, has large hotels, and is in a picturesque and fertile region. It has important manufactures of agricultural implements, sewing machines, foundry products, saws, edge tools, furniture; flour, saw, and planing mills, ship yards, tanneries, woolen factories, and breweries. Saint Catharines also carries on an extensive fruit trade. It has good water and sewerage systems, gas and electric lights, banks, and newspapers. The more noted local institutions are Bishop Ridley College, a marine hospital, and a commercial college. Pop. about 10,000.

**Saint Chamond**, sãh shã-môn, France, in the department of Loire, eight miles northeast of Saint Etienne by rail, at the confluence of the Gier and Janon, is a well-built manufacturing city. There are large coal mines in the vicinity, famous dye-works, and extensive metallurgical manufactures, and various other industrial works, including large mills for the manufacture of silk, lace, etc. The remains of a Roman aqueduct are found at Saint Chamond. Pop. about 17,000.

**Saint Charles (Ark.), Engagement at**, a battle of the Civil War, fought in Arkansas County on the White River, 17 June 1862. On 10 June Capt. C. H. Davis, then in command of the Federal Mississippi flotilla, received a request from Gen. Halleck to open up the White River for communication; he accordingly despatched a force under Commander Kilty, consisting of the ironclads Mound City and Saint Louis, and the wooden gunboats Lexington and Conestoga. Meanwhile the Confederates had fortified the bluffs at Saint Charles and, on learning of the approach of the Union vessels, had sunk their gunboat Maurepas across the channel and transferred her guns to the shore-battery. On 17 June a detachment of Federal troops landed below the bluffs, and the gunboats opened the attack upon the Confederate position, the Mound City leading; when she was within 600 yards of the shore a 42-pound shell entered her casemate and exploded her steam-drum; badly crippled she was towed out of action by the Conestoga, and the other boats continued the attack. The commanding officer of the land forces very shortly signaled them to stop firing, and the troops successfully stormed the Confederate battery. The Confederate loss was 6 killed, 1 wounded, and 8 missing; the most serious Federal loss was on the Mound City, the majority of her crew being killed by the escaping steam, or in consequence of jumping into the river. Of 175, only 3 officers and 22 men were saved. As there were no Confederate works farther up the river, this action gave control of the White River to the Federals. Consult: Mahan, 'The Gulf and Inland Waters,' p. 50; 'Battles and Leaders of the Civil War,' Vol. III., pp. 552-3.

**Saint Charles, Mo.**, city, county-seat of Saint Charles County; on the Missouri River, 20 miles from its mouth, and on the Wabash, the Missouri, K. & T. R.R.'s; about 18 miles

northwest of Saint Louis. It was settled in 1765 by Blanchette "Chasseur," incorporated in 1795, and chartered as a city in 1805. There is an electric road connecting Saint Charles with Saint Louis. The city is in an agricultural region, in which the chief products are wheat and corn. The principal manufacturing establishments are car works in which there are 1,800 persons employed and flour mills. The city has large grain elevators, tobacco factories, and a foundry and machine shop. The principal public buildings are a court-house, 10 churches, the schools, and Saint Joseph's Hospital. The educational institutions are Sacred Heart Academy, opened in 1818; Saint Charles Military College, opened in 1838; Lindenwood College, opened in 1830; a high school, public and parish elementary schools, private schools, and four libraries. The three banks have a combined capital of \$150,000, and the annual amount of business is about \$1,400,000. The government is vested in a mayor and a council of eight members, elected biennially. Pop. (1890) 6,161; (1900) 7,982; (1910) 9,437.

Editor 'Banner News.'

**Saint Charles College**, at Ellicott City, Md.; founded 11 July 1831, under the auspices of the Roman Catholic Church. The funds for the institution were donated by Charles Carroll of Carrollton, one of the signers of the Declaration of Independence, who gave 253 acres of land from his own domain, and \$5,349 in money. The charter of the school as agreed upon by Archbishop Maréchal of Baltimore and Charles Carroll, stipulated that the purpose of the school was "the education of pious young men of the Catholic persuasion for the ministry of the gospel," and that the legal administration of the college should be entrusted to five trustees, who must be citizens of the United States. The founder also requested that the trustees be members of the Society of Saint Sulpice. The school was not opened until October 1848. The faculty then consisted of the president, one assistant and four students. At the present date (1910) the faculty numbers 15, the students 173. The total number that have matriculated is 4,000; and about 1,400 have been ordained priests. The grounds have been improved and a number of fine buildings supply all needful space. Saint Charles College forms the classical department of Saint Mary's University and Theological Seminary of Saint Sulpice, at Baltimore. The course including the preparatory work is six years. The college has power to grant degrees. There are three libraries; the main one has about 16,000 volumes; the library connected with the reading room has 5,000 volumes, and the library for the Juniors is in their own part of the college. Several scholarships are available on competitive examination.

**Saint Christopher**, popularly **Saint Kitts**, West Indies, 45 miles northwest of Guadeloupe, is an island belonging to the Leeward group, and a British possession. Its area is 68 square miles; its length 23 miles, breadth five miles. It is traversed by a rugged range whose highest summit, Mount Misery, has an altitude of 4,100 feet. Basse-Terre, the capital, on the coast, has a population of about 7,000. It is united administratively with Nevis, and the small island Anguilla. The chief products are sugar, mo-

## SAINT CLAIR—SAINT CLOUD

James, rum, salt, some coffee, tobacco, and cattle. The island was discovered in 1493 by Columbus; colonized by the French and British simultaneously in 1606, and held by those nations alternately for some time, passing over entirely to England in 1713.

**Saint Clair, Arthur**, American soldier: b. Edinburgh, Scotland, 1734; d. Greensburg, Pa., 31 Aug. 1818. He was a grandson of the Earl of Roalyn and was educated at the University of Edinburgh, after which he studied medicine. He came to America with the fleet of Admiral Boscawin and took part in the capture of Louisbourg and of Quebec. In 1762 he resigned his commission of lieutenant and two years later established a home and a manufacturing industry in Ligonier Valley, Pa. He became prominent in his vicinity and held several civil offices. In 1775 he was made colonel of militia; and on 9 Aug. 1776 was appointed brigadier-general and was ordered by Washington to organize the New Jersey militia. He fought at Trenton and Princeton, and having been appointed major-general in 1777, succeeded General Gates in command at Ticonderoga. At the approach of Burgoyne, with a force more than three times outnumbering his, he evacuated the fort on account of his inability to protect all the exposed points. A part of his force was attacked and defeated at Hubbardton. For this disaster he was tried in court-martial in 1778, but acquitted of the charges brought against him. He commanded a body of troops in 1781-2 under General Greene in the South; was a delegate to the Continental Congress in 1785-7 and its president in 1787. He was appointed first governor of the Northwest Territory in 1789, and was appointed commander-in-chief of the forces engaged in warfare with the Indians in 1791, but was defeated on 4 November, near the Miami villages. In March of the following year he resigned his commission and in 1802 President Jefferson relieved him of the governorship of the territory. He published a narrative of the manner in which the campaign against the Indians in the year 1791 was conducted under the command of Maj.-Gen. St. Clair with his observations on the statements of the Secretary of War (1812). Consult: W. H. Smith, 'The Life and Public Services of Arthur St. Clair' (1882).

**Saint Clair, Mich.**, city in Saint Clair County; on Saint Clair River at the mouth of the Pine River, and on the Michigan Central railroad; about 43 miles northeast of Detroit and 12 miles south of Port Huron. A ferry connects the city with Courtwright on the Canadian side of the river. It is in an agricultural region and has considerable manufacturing interests. The chief industrial establishments are lumber mills, sash, door, and blind factories, ship-yards, salt works, brick works, iron works, foundry, tannery, and brewery. There is a good system of waterworks, several well built churches and schools. Pop. (1890) 4,353; (1900) 2,543; (1910) 2,633.

**Saint Clair, Pa.**, borough in Schuylkill County; on Mill Creek, and on the Philadelphia & Reading railroad; five miles north of Pottsville. An electric railroad connects the borough with Pottsville. It is in an anthracite region, and the chief industries are connected

with mining and shipping coal. It has machine shops, a foundry, a tool factory, large coal and brick yards, and a large mining implement works. There are a high school, public and parish schools, a private school, and a library. There is a large trade in coal. Pop. (1890) 3,680; (1900) 4,038; (1910) 6,455.

**Saint Clair**, a lake on the boundary between Michigan and Canada, and between Lake Huron and Lake Erie. It receives the waters of Lake Huron through Saint Clair River and discharges its waters into Lake Erie through Detroit River. It is about 30 miles long, from north to south; its maximum width is 24 miles and the average width 12 miles; area, 396 square miles. It is about 3 feet higher than Lake Erie and 5.4 feet lower than Lake Huron. The northern part is shallow, owing to the sediment from Saint Clair River; the average depth of the central part is 19 feet. The bed is covered with a blue mud, with sand and gravel in some parts, all supporting a dense growth of low vegetation in which are many forms of animal life. The lake is noted for the large number of steamers and the enormous tonnage which it carries each year.

**Saint Clair**, a river called originally Sinclair, in honor of Patrick Sinclair, a British officer, who in 1765 purchased from the Indians, a tract of land along the river. The river is the outlet of Lake Huron, and discharges its waters by several channels into Lake Saint Clair. The delta at the mouth is known as the Saint Clair Flats. A number of summer cottages and hotels have been built on the Flats. One of the channels has been improved for navigation; a canal about one and one half miles long has been built at such an angle as to shorten the course, and of such a width and depth as to admit large lake steamers. A railroad tunnel under the river connects Port Huron (q.v.) in the United States with Sarnia (q.v.) in Canada. It is nearly two miles long, including approaches, and was opened for travel in 1891. The river is about 41 miles long.

**Saint Cloud**, *sân-kloo*, France, in the department of Seine-et-Oise, on a height near the Seine, seven miles west of Paris, is charmingly situated and especially interesting for its historical associations. It commands a superb view of Paris, and the beautiful shady park, with its chateau and elegant fountains, is a favorite resort of Parisians. Within the precincts of Saint Cloud are situated the new national Sèvres porcelain manufactory. The chateau was built by Gondi in 1572, purchased by the Duke of Orléans, the brother of Louis XIV. in 1658, and by Louis XVI. for Marie Antoinette in 1782. Henry III. was murdered in the old mansion by Clement 21 Aug. 1589. Peter the Great was received there in 1717. It was the scene of Napoleon's coup of 18th Brumaire, and his favorite residence; here he caused himself to be declared first consul, and here Blücher had his headquarters (1815). At Saint Cloud, Charles X. (1830) affixed his signature to the ordinances which doomed him. Napoleon III. signed here the declaration of war against Prussia (1870).

**Saint Cloud**, *klowd*, Minn., city, county-seat of Stearns County; on the Mississippi River, and on the Northern P. and the Great

## SAINT CROIX - SAINT DIZIER

**N. R.R.s**; about 63 miles north of Minneapolis, two miles below the mouth of the Sauk River. It was settled in 1852 by Ole Bergeson, incorporated in March 1856, and became a city in 1868. In the vicinity are extensive granite quarries. The city has good water-power and a number of manufactories. There is a large surrounding region in which are productive farms. The chief manufacturing establishments are flour mills, foundries, machine shops, wood working factories and railroad shops. There are large grain elevators, stock yards, and several well built business houses. There is considerable trade in granite, farm products, flour and wood work.

Saint Cloud has the Minnesota State Reformatory Prison, Saint Raphael's Hospital, and Saint Joseph's Home for the Aged. The educational institutions are a State normal school, Saint Clotilde's Academy of Music, five public schools, three Roman Catholic parish schools, and a library. The five banks have a capital of \$300,000. The government is vested in a mayor and a council of 15 members, three of whom are elected each year. Pop. (1890) 7,686; (1900) 8,663; (1910) 10,600. C. F. McDONALD, Editor 'Daily Times.'

**Saint Croix** (sometimes called **Schroonic**), (1) a river, the outlet of Grand Lake, flows south, east-southeast, and forms part of the boundary between Maine and New Brunswick. It flows into Passamaquoddy Bay. It is 75 miles long; navigable as far as Calais, Maine, above which there is extensive waterpower. (2) A river which has its rise in Douglas County, Wis., flows southwest to the Minnesota border, then south, forming the boundary between Wisconsin and Minnesota for a distance of about 100 miles, entering Mississippi River at Prescott, Wis. It is about 150 miles long and navigable to the Falls or the Dalles, a distance of 54 miles from its mouth. At the Falls there is a descent of 50 feet in 900 feet, and below there is a cañon.

**Saint-Cyr**, **Laurent Gouvion**, 18-rôô goo-vê-ôn sãn sêr, MARQUIS DE, marshal of France: b. Toul, France, 13 April 1764; d. Hyères, France, 17 March 1830. In 1792 he entered the army and attached to the staff of General Custine. He was rapidly promoted and in 1796 commanded the centre division in the army on the Rhine under Moreau. He was appointed to the command of the army of Italy in 1798 where he re-established discipline, the army having been on the verge of revolt against their general, Masséna. He returned to the army of Moreau in 1799, was victorious at Biberach in 1800, and in 1801 was sent to Spain to command the army which was to invade Portugal. After the treaty of peace was signed he became ambassador at Madrid. He participated in the Prussian and Polish campaigns of 1807, and in 1808 was in command in Catalonia, where he relieved Barcelona. In 1811 he was assigned to the command of a corps in the Russian campaign. He was victorious at Polotsk in 1812 and was created marshal of France in recognition of his services. He made a brilliant fight at Dresden, but was forced to capitulate and remained a prisoner in Hungary for some time. After the Restoration he was created a peer of France, was appointed minister of war in 1815, minister of marine in 1817 and a few months

later minister of war again, retiring in 1819. He wrote: 'Journal des Opérations de l'Armée de Catalogne en 1808 et 1809' (1821); 'Mémoires' (1829-31); etc. Consult De Vernon, 'Vie de Maréchal Gouvion Saint-Cyr' (1857).

**Saint Cyr**, or **Saint Cyr-Piccole**, sã-hol, France, a village near Paris, west of Versailles, at the end of the old park of Louis XIV., celebrated for its military school. Madame de Maintenon founded here (1686) a seminary for the education of the daughters of families of high rank in reduced circumstances. The convent chapel contained the tomb of Madame de Maintenon, and Racine's 'Esther' and 'Athalie' were written for the pupils of the school and first acted there. During the Revolution this institution was abolished, and in 1806 Napoleon transferred to Saint Cyr the famous military academy which he had founded at Fontainebleau. Two advanced forts of the new enceinte around Paris are situated at Saint Cyr. Pop. 2,835.

**Saint Denis**, sãn dê-nê, France, in the department of Seine, 4½ miles north of Paris, is an important junction on the Northern railroad. The town is especially celebrated for its venerable abbey, from which it derives its name; the two high towers are respectively Romanesque and Gothic; the rose window dates from the 13th century. The abbey was the burial place of the kings of France and in the chapels of the nave are the tombs of Louis XII., and Anne of Brittany (1591); of Henry II.; Catharine de' Medici; of Louis of Orleans; of Francis I.; and Claude of France—one of the splendid tombs of the Renaissance; and that of Dagobert, one of the most curious of mediæval (13th century) works of art. The crypt dates partly from the time of Charlemagne. In the centre is the vault, where the last king reposes—Louis XVIII., the only one whose ashes have been respected. The crypt also contains the Bourbon vault, where repose Louis XVI. and Marie Antoinette. Modern features deserving notice are an orphanage (1886), the monument commemorative of the Revolution and other public statues, and the railway station. In 1888 the old Hotel Dieu was converted into a hospital for old men.

**Saint-Denis**, the capital of the French island of Réunion in the Indian Ocean, on the north coast of the island. It is built on a long, narrow beach shut off on the land side by a range of high volcanic mountains. In the city are a cathedral, a palace for the governor, a theatre, and a large number of educational institutions, including a lyceum, several large schools, a library, a museum, and a botanical garden. The harbor is an open roadstead exposed to frequent severe storms, but a new, protected harbor has been constructed at Pointe des Gallets, a few miles to the west, which is connected with the city by a railroad. Pop. about 35,000, chiefly French creoles.

**Saint Dizier**, sãn dê-zê-â (ancient **Desmum Fanum**), France, department of Haute-Marne, on the Marne, 35 miles southeast of Châlons. Part of the old castle is standing and the church has some peculiar Gothic windows. There is a library and a museum. It is an important centre of the iron trade, with foundries of iron, steel, copper and bronze, engineering works,

etc. It is a railway station. In 1544 Saint Dizier was besieged and taken by Charles V., although strongly fortified. In 1814 there was severe fighting nearby, between Napoleon and the Allies. The walls have been razed and the site now constitutes the promenade of the town. Pop. about 15,000.

**Saint Elias, Mount**, in Alaska, in the southeastern part of the Territory; lon. 140° 55' 47.3" W.; lat. 60° 17' 35.1" N. The United States Coast and Geodetic Survey report the height 18,100 feet above sea-level. It rises from an elevation of considerable height, and the foot-hills on the south side are covered with trees. The timber line is from 2,000 to 2,500 feet above sea-level. The mountain itself is covered with snow and ice and has many glaciers. The south side is almost perpendicular; the storms of ages and the avalanches have removed many of its rugged features. The north side is more accessible, and has been explored to some extent. The Malaspina Glacier (area 1,500 square miles) is at the foot of Mount Saint Elias, near Yakutat Bay.

**Saint Elmo Castle**, Naples, Italy, a fortress crowning a rocky hill on the western outskirts of the city. It was built by Robert the Wise in 1343. It has massive walls surrounded by fosses cut out of the solid rock, and was long held to be impregnable. It is now used as a military prison.

**Saint Elmo's Fire**. See **ELMO'S FIRE**, **SAINT**.

**Saint Etienne**, sâh-tê-tên, France, a manufacturing town in the department of the Loire, on the Furens, 32 miles southwest of Lyons. It is located amid some of the richest coal fields of France. The important buildings include the old abbey of Valbenoite, dating partly from the 13th century, a Protestant church, a synagogue, a town house, a school of mines with fine collections, and an art palace, with a museum and library, rich in old MSS., collections of natural history, and of ancient artillery. The enormous metallurgical establishments yield one third of the whole French production of steel, manufactured according to the Bessemer and Martin processes, the national gun factory and other metal works; the manufacture of hemp cables, pottery and lime, the weaving of ribbon, laces, trimmings, etc., and conditioning of silk are among the varied and active industries of the town, giving employment to thousands of men and women. The collieries are very extensive, employing alone 15,000 miners, while 80,000 work in the ribbon factories, 16,000 work in heavy iron goods, hardware 7,000, military and naval material, etc., 6,000.

**Saint Eustatius**, 8-stî-shî-ds, or **Saint Eustache**, sâh-tê-stâsh, an island of the Dutch West Indies, lying south-southeast of Porto Rico, 12 miles northwest of Saint Christopher. It consists of two volcanoes with an intervening valley, and covers an area of eight square miles. Sugar, cotton, maize, yams, potatoes, and above all tobacco are cultivated. Yarns and sweet potatoes are exported. The only landing is protected by two forts. The Dutch acquired the island in 1600, colonizing it in 1635. It suffered many vicissitudes at various periods under English and French occupation, but in 1814 was finally restored to the Dutch. Orange-

town is the only town. Earthquakes are frequent. It has a salubrious climate. Pop. about 2,000, mostly negroes.

**Saint-Evremond**, sâh-tîv-môn, Charles de Marguetel de Saint Denis, French courtier and author: b. Saint Denis du Guast 1 April 1613; d. England 20 Sept. 1703. He was educated by the Jesuits, entered the army about 1639 and served in the Thirty Years' war. He was a witty and accomplished courtier, and was for a time a favorite with Condé and also with the king; but incurred their displeasure by his sarcastic raillery and especially by his letter on the Peace of the Pyrenees. In 1662 he went to England, where he became a favorite at court and received a pension of £300 (\$1,500) from Charles II. He wrote dramas, essays and letters, his collected works being published in 1705. These include 'Sir Politics,' written with Buckingham.

**Saint Francis**, a river which rises in eastern Missouri and flows into the Mississippi River in Arkansas, lat. 34° 45' N. It is a large river, and was formerly navigable 300 miles for large keel boats; but the earthquakes of 1811-12 raised its channel so much, and so irregularly, as to cause the waters to overflow the banks and form a vast number of lakes and swamps along its former course. At high water the river is still navigable at some seasons of the year for about 150 miles; and there are several settlements about 70 miles from its mouth. Its waters abound with excellent fish. Length, about 450 miles.

**Saint Francis Xavier College**, located in New York. It was founded in 1847 by the Jesuits, and was granted the powers of a university in 1861 by the State board of regents. Its organization includes a collegiate and a preparatory department. The regular college course leads to the degree of A.B.; it includes instruction in logic, metaphysics, and theology, English and the classics, mathematics and science, and history. Post-graduate work in literature, history, sociology and psychology is provided for, and leads to the degree of A.M. There are 46 scholarships. The college is well equipped; the library in 1910 contained 115,000 volumes, and the grounds and buildings were valued at over \$750,000. The students in 1910 numbered 454, a large majority being in the preparatory department, and the faculty 38.

**Saint Gall**, gâl, Switzerland, (1) capital of the Canton of Saint Gall, on the Steinach, in a high, narrow valley, about 50 miles from Zürich. It is the see of a bishop, and has besides the cathedral, several churches, a monastery, now containing public offices, a large town-house, library, and orphan asylum. The town library is rich in works relating to the Reformation. The ancient Benedictine Abbey was famous as an asylum of learning during the Dark Ages, and was one of the most celebrated educational institutions of Europe. Several of the classics, namely, Quintilian, Sillicus, Italicus, and Ammianus Marcellinus, were solely preserved among its MSS. Notker and Ekkehard were among its pupils. Saint Gall is an important manufacturing centre, celebrated for its fine laces and embroideries.

(2) The Canton covers an area of about 780

## SAINT GAUDENS—SAINT GERMAIN-EN-LAYE

square miles. It has a diversified surface; the southern and central portions are covered by lofty Alpine ranges. Its principal lake is the Wallenstadersee. The climate of the valley is mild, but in the mountainous district is rigorous. There are important stone quarries, much wood and good pastures; on the lower slopes vineyards and orchards, and some arable lands. Manufactures consist of cotton and linen goods. The constitution is preeminently democratic. German is the language spoken. Pop. about 255,000.

**Saint Gaudens**, gl'dēnz, Augustus, American sculptor: b. Dublin, Ireland, 1 March 1848; d. Cornish, N. H., 3 Aug. 1907. He was brought to the United States in infancy and at 13 was bound in apprenticeship to learn cameo-cutting and spent several years at this art. Six years later (1867) he went to Paris and studied under the sculptor Joffroy at the Ecole des Beaux Arts. While at Rome in 1871 he produced his first figure, 'Hiawatha,' and the following year returned to the United States. The Sherman equestrian statue which was unveiled at the southeast entrance of Central Park in 1904 is the last of a series of five in which are commemorated heroes of the Civil War, among the most notable of which is the remarkable statue of Farragut in Madison Square, New York. Saint Gaudens was a sculptor of originality and freshness, who had adopted the best standards of French taste and method of execution without being hidebound by tradition; he had a style at once polished and free. Among his other works are the 'President Lincoln' statue in Lincoln Park, Chicago; the bas-relief 'Adoration of the Cross by Angels'; the 'Shaw Monument' at Boston; and the 'Diana' on the tower of Madison Square Garden, New York. He also took part in executing the 'Parnell Memorial' monument in 1901, designed several medals of presentation authorized by Congress, and assisted John La Farge in decorating Trinity Church, Boston.

What perhaps is the most striking characteristic of all his ideal statues is that of 'The Puritan' (at Springfield, Mass.). This is the puritan of earlier New England in all his aggressive and unbending strength—soldier, theologian, statesman. There is nothing winning or conciliating in his air. He is come to conquer the wilderness as Cromwell conquered the aristocracy of England and wiped out for the brief period of the Commonwealth the haughtiest of European dynasties. The puritan, as Saint Gaudens has portrayed him, carries the Bible next his heart in one hand and a stout cudgel of oak in the other. He personifies those unswerving, and sometimes fanatic principles on which the ancient commonwealths of New England were established. Of the Sherman monument, executed by Gaudens, a critic had said: 'The composition of the Sherman is his own, and it has the spontaneity and the balance of a work evolved straight from a powerful imagination and an original mind. The Victory is exactly where it belongs, and bears a relation as true, as unforced, as anything in nature itself to the horseman pressing close upon its flying robe. Once more a word on the sculptor's discretion is inevitable. He wanted to express movement in this monument, to give to Vic-

tory almost aerial lightness in her carriage, to embody in the horse a type of great strength, pushing its way to the front, and to make Sherman himself the very ideal of a leader, who spurns the miles behind him. The bronze seems almost sentient. The group quivers with vitality. But the rhythm of this dramatic conception is held so well in hand, it is so majestic, that classic art itself could not produce a more nobly monumental effect.'

**Saint George and the Dragon.** See DRAGON.

**Saint George**, Cape, Newfoundland, the westernmost projection of the island, forming the northwestern extremity of Saint George Bay, on the Gulf of Saint Lawrence.

**Saint George's Channel**, an arm of the Atlantic which separates Ireland from England. At the north it unites with the Irish Sea. Its entire length from southwest to northeast is about 210 miles. The tide rises in this channel about the same time as in the English Channel, so that there is high water simultaneously at Brest in France, Falmouth in England, and Cape Clear in Ireland.

**Saint George's Chapel**, Windsor, England. See WINDSOR CASTLE.

**Saint Germain**, sā-zher-mān, COURTIER, adventurer of the 18th century: b. perhaps 1710; d. Eckernförde, Schleswig, 1784. A mystery enveloped his birth and origin, of which he took every advantage. He spoke English, German, Italian, Spanish, and Portuguese to perfection, and French with a slight Piedmontese accent; and was variously thought to be the son of a tax collector at San Germano, Savoy, an Alsatian Jew, a Portuguese marquis named Betmar, or the illicit offspring of a Spanish princess. After sojourning in various cities of Italy under as many pseudonyms, he lived from 1750 to 1760 at the French court under the patronage of Marshal de Belle-Isle, and, having a fine personal appearance and address, considerable erudition, and a wonderful memory, became a favorite of Mme. de Pompadour and the king. He was reported to be from 2,000 to 3,000 years old. Frederick the Great, having asked Voltaire for some particulars respecting this mysterious person, was told that he was 'a man who never dies and who knows every thing.' He passed the last years of his life at the court of the prince of Hesse-Cassel, and is supposed to have been employed during the greater part of his life as a spy at the courts at which he resided. Cagliostro owned himself a pupil of the Count of Saint Germain. Consult: Oettinger, 'Graf Saint Germain' (1846).

**Saint Germain-en-Laye**, sā lā, France, a town in the department of Seine-et-Oise, on a height bordering the Seine, nine miles west of Paris. At the edge of a forest, 200 feet above the river, the air is bracing and salubrious. It is a favorite summer resort and residence of Parisians. The terrace of Saint Germain is one of the finest promenades in Europe and commands an extensive view of the valley of the Seine and surrounding hills. The ancient castle of the town now serves as a museum of antiquities; it was destroyed and restored at various epochs. In the Henry IV. pavilion Thiers died (1877). The old castle was first built by Charles V.

(1370), and reconstructed and embellished by many succeeding sovereigns, especially Louis XIV. Here were born Charles IX., Margaret of Navarre, Henry II., and Louis XIV. James II. of England and most of his family here lived and died as exiles. It now serves as barracks and a military prison. Saint Germain is the seat of one of the cavalry garrisons which surround Paris; at a short distance is the Convent des Loges, connected with the Legion of Honor (Saint Denis).

**Saint Germain de Rimouski.** See RIMOUSKI.

**Saint Gotthard,** göth'ard, Switzerland, a mountain group on the confines of the cantons Uri, Grisons, Ticino, and Valais, belonging to the Lepontine or Helvetic Alps, which it connects with the Bernese Alps. It forms a kind of central nucleus in the great watershed of Europe; each of its slopes giving rise to an important river -- the north to the Reuss, the south to the Ticino, the west to the Rhône, and the east to the Rhine; all these rivers rise within a circuit of 10 miles from its centre. The culminating point has a height of 10,600 feet, and three other summits are beyond the limit of perpetual snow. The Col of Saint Gotthard, at its summit level, where the Hospice stands, is 6,808 feet high. A bridle path over the pass had existed since the 6th century and over it an excellent carriage road was completed in 1832, in which, particularly on the Italian side, formidable difficulties were surmounted, and much engineering skill displayed. A railway tunnel pierces this mountain group between Göschenen on the north and Airolo on the south, thus directly connecting the railway system of North Italy with those of Switzerland and Western and Central Germany. This tunnel is the longest in the world, being 16,295 yards, or rather more than 9¼ miles long. Its construction, begun in 1872, was completed in 1881, and it was opened for traffic early in 1882. Its total cost was about \$45,400,000, defrayed by Swiss, German, and Italian state subventions, by mortgages and shares. The excavation was carried on simultaneously on the Italian and the Swiss side, the workmen finally meeting in the middle, where the height above sea-level is 3,785 feet.

**Saint Gregory.** See GREGORY, SAINT.

**Saint Helena,** hē-lē'nā, an island in the Atlantic, belonging to Great Britain, 700 miles southeast of the island of Ascension, the nearest land. The area is about 47 square miles. Although isolated as relates to its contiguity to the mainland, it is in the direct line of ocean communication via the Cape of Good Hope, many vessels making it a halting station. It is an extinct volcano whose crater forms the main ridge. Many gorges, some of which are 1,000 feet deep, converge from the walls of the crater in all directions and numerous caves have been formed. High cliffs extend all around its shores to the water's edge, and there is a good harbor.

The fauna and flora are deeply interesting, many specimens being peculiar to the island. Farm and garden produce constitute the entire wealth of the colony; Jamestown (3,000 inhabitants) is the only town. Longwood, where Napoleon died, is a farm-house, standing on a high plain. The Portuguese discovered the is-

land, subsequently the Dutch took possession, and later it was ceded to Great Britain. Its chief interest consists in its being the scene of Napoleon's captivity.

**Saint Helena,** England, Lancashire, 11 miles northeast of Liverpool, a municipal county and parliamentary borough, and market town. A town hall (1875-6), a technical institute (1896), churches, schools, library and baths, an asylum and hospitals, besides numerous parks and recreation grounds are the main modern features. The town owes its importance to the coal-beds in the environs, and to its glass-works, copper-smelting, the manufacture of iron and steel, chemical and lead works, potteries, breweries and other industries.

**Saint Helena,** a volcanic peak of the Cascade Range, in the State of Washington; lat. 46° 12' N., lon. 122° 4' W. The volcanic débris at the base and beyond is of ancient origin; the mountain has all the appearance of an extinct volcano. Height, 9,750 feet. It resembles Mount Rainier in its treeless sides and ice-covered summit, but it is smaller. On the north side, at the base, is Spirit Lake.

**Saint Helier,** hē-l'yer, Channel Islands, capital of the Island of Jersey, and a favorite European summer resort, on the east side of Saint Aubin's Bay, on the south coast. It is strongly fortified and defended by Elizabeth Castle (1551-86), on a rocky island connected with the mainland by a causeway, and by Port Regent, an imposing citadel dominating the town. The principal buildings are Victoria College; the Maison Saint Louis or Jesuit College; the courthouse; public library, town hall, hospital, Norman parish church, and the French Roman Catholic cathedral. Fine markets, an esplanade and marine drive four miles long encircling the bay, and extensive and well built harbors, are prominent features. There is considerable trade with England, France, and India, in fruit, potatoes, and cattle. Pop. 29,100.

**Saint Henri,** or Tannery West, Canada, an incorporated city of Hochelaga County, Quebec, suburban to Montreal on the southwest. It is a busy industrial centre on the Lachine Canal, and has a station on the Grand Trunk Railway. Cotton, leather, confectionery, sewing machines, and machinery are among its principal manufactures.

**Saint Hilaire,** sâ-tē-lîr, Auguste François César, called Auguste Prouvençal de, French naturalist and traveler: b. Orléans 4 Oct. 1779; d. there 30 Sept. 1853. A botanical expert, he set out in 1816 on a long journey through Brazil, carrying his explorations to regions then unknown, and returning in 1822 with valuable collections. In 1830 he was admitted to the Paris Academy of Sciences; subsequently he was made professor of botany in the faculty of sciences at Paris. He made several discoveries of scientific value, and published three narratives of travel, 'Voyage dans la Province de Rio de Janeiro et Minas Geraes' (1830); 'Voyage dans le District des Diamants et sur le Littoral du Brésil' (1833); 'Voyage aux Sources de San Francisco et dans la Province de Goyaz' (1847-8); besides 'Flora Brasiliæ Meridionalis' (with Jussieu and Cambesides 1845), and 'Leçons de Botanique' (1840-1).

**Saint-Hilaire**, *Manco de*, pseudonym of **EMILE MARC HILAIRE**, French writer: b. Versailles about 1796; d. 5 Dec. 1887. He was educated as a page at the court of Napoleon I., and finding himself without means of support after the Restoration, turned his attention to literature. Though not important as a writer, his continued glorification of Napoleon was popular and undoubtedly did much to pave the way for the Second Empire. His work includes: 'Mémoires d'un Page de la Cour impériale' (1830); 'Souvenirs de la Vie privée de Napoléon' (1838); 'Souvenirs intimes du Temps de l'Empire' (6 vols., 1838-46); 'Histoire de Napoléon III.' (1853); etc.

**Saint Hubert**, Order of, a Bavarian order founded by Gerhardt V. in 1444, and which was originally named the Order of the Horn, so called from the hunting horns of which the links of chain were made. The membership was composed of the nobility, the number being unrestricted, while the number of members of lower rank was limited to 12. A white cross with eight points, on each of which is a small golden ball, constitutes the decoration. A crown surmounts the cross, while the arms of the cross are divided by three rays of gold representing Light from Heaven. On the medallion is pictured Saint Hubert's conversion, under which, on a red ribbon, is the inscription *"In terris ueritas"* (Firm in Faith).

**Saint Hyacinthe**, *hi'a-sinth* (Fr. *Saint à-saint*), Canada, city and port of entry, county-seat of Saint Hyacinthe County, Quebec; on the Yamaska and Black rivers, and on the Grand Trunk, Canadian Pacific, Intercolonial, and Quebec Southern railways; 35 miles northeast of Montreal. It is the seat of a Roman Catholic bishop, and among its more notable institutions are Saint Hyacinthe College (Jesuit), occupying a handsome stone building, a nunnery with a seminary for young ladies, a hospital in charge of the Sisters of Charity, and monasteries of the Precious Blood and Dominican Fathers. The principal manufactures of the city are woollen goods, lace, linens, hosiery, corsets, boots and shoes, leather, flour, lumber, woodenware, organs, agricultural implements, and casting and machinery. Pop. about 10,000.

**Saint Ignatius College**, a Roman Catholic institution located at Chicago, Ill. It was chartered in 1870, and is under the control of the Jesuits. It has a collegiate or classical, a commercial, and an academic department; religious instruction is a part of all courses. In the collegiate department the degrees of A.B., B.S., and Ph.B. are conferred; and the degrees A.M. and Ph.D. for graduate work. Though the College is designed especially for Roman Catholic students, non-Catholics are admitted. The library contains over 35,000 volumes, including a select library for the special use of undergraduates; there are also a good scientific laboratory equipment and valuable mineralogical and zoological museums. There are no dormitories. The College has no endowment, and is dependent mainly upon its tuition fees for income; the students number about 500, and the faculty about 40.

**Saint Ives**, *ivz*, England, seaport and watering resort, in Cornwall on Saint Ives Bay, 57 miles southwest of Plymouth. The parish

church of Saint Andrew is in the Early Perpendicular style of the 15th century. The town-hall, a free library and a new pier, arc, besides the harbor, the chief features of interest. Pop. about 7,000.

**Saint Jacob**, or *Sankt Jakob*, *säntk yä'kōp*, Switzerland, a small village on the Birs in the canton of Basel, two miles southeast of Basel. It is noted for the important battle fought there on 26 Aug. 1444, between the Swiss Confederates and the Armagnacs, in which the latter were totally defeated.

**Saint James' Coffee-house**, a famous Whig coffee-house of London which flourished from the time of Queen Anne until late in the reign of George III. It stood on Saint James' Street in the neighborhood of Saint James' Palace, and was much frequented by Swift and Harley in its early days. It was here that Goldsmith's poem 'Retaliation' originated. The poet, a member of a group of men of talent who met here, was proverbially late in his arrivals. On one such occasion those present wrote in jest epitaphs "on the late Dr. Goldsmith." None is preserved save Garrick's, which became famous:

Here lies poet Goldsmith, for shortness called Noll;  
He wrote like an angel, but talked like poor Poll.

The retort above mentioned dealt in a satirical vein with the club members who had exercised their wit upon him.

**Saint James' Palace**, England, a royal palace in London, between Saint James and Green Parks. It was built originally for a hospital, reconstructed by Henry VIII., enlarged by Charles I., and up to the time of George IV. was the permanent royal residence. It is still known as the Court of Saint James, being occupied by the royal family. Henry VIII. annexed to the palace a park enclosed by a brick wall, connecting it with Whitehall. Queen Mary died here in 1558; Charles I. spent his last night in this palace; and here were born Charles II., the Old Pretender, and George IV. After Whitehall burned down in 1697, Saint James became the London residence of the sovereigns up to the time of Queen Victoria. In 1837 Buckingham Palace became the royal home. The park covers 58 acres.

**Saint Jean d'Acre**, *sän zhōn dāktr*, Palestine. See **ACRE**.

**Saint John**, one of the 12 Apostles of Jesus Christ. He and his brother James are often spoken of as sons of Zebedee. It is commonly accepted (cf. Mark xv. 40 and Matt. xxvii. 56) that his mother's name was Salome and it is still further conjectured by many (see John xix. 25) that she was a sister of Mary, the mother of Jesus—a relation which would render more natural the committing by Jesus of his mother to the care of John. The family seems to have possessed some means, as Zebedee employed hired servants in his fishing business, Salome is mentioned among the pious women who aided in the support of Jesus and his associates during his ministry, and John himself was personally known to the high priest.

Of his early life we know nothing. Presumably he had the ordinary training of the Jewish boy of his time, and no more. In the order

## SAINT JOHN . . .

of narration, he first appears, according to an obvious inference, as an unnamed disciple of John the Baptist, who with Andrew follows Jesus (John i. 35-39). After some association with Jesus, John returned to his occupation as a fisherman, from which Jesus summoned him and his brother, together with Simon and Andrew, to discipleship, which was the basis of his appointment as one of the 12 apostles. In this company he was one of the three who were admitted to the closest intimacy with their Master and, indeed, is understood to be "the disciple whom Jesus loved." Little in particular is noted, however, in reference to him while Jesus lived. He and his brother are said to have been called "Boanerges," defined as "Sons of Thunder" (Mark iii. 17). While the meaning is somewhat obscure, it seems most probable that this hints at great stores of emotional power and passion. He, with his brother, is rebuked for proposing to summon fire from heaven to destroy the inhospitable Samaritan village, and he alone confesses attempting to check the activity of a healer who was not of their company. He alone of the apostolic company is mentioned as present at the trial of his Master and at his crucifixion, where he received the commission to care for Mary, the mother of Jesus, which he faithfully carried out, making a home for her till her death.

It appears from the statements in Acts and of Paul in his Epistle to the Galatians that for some time John remained in Jerusalem. Beyond this we are dependent upon tradition, which consistently associated the latest years of his life with the city of Ephesus. To be sure, on the basis of uncertain inferences from an obscure passage possibly incorrectly quoted by Eusebius from Papias, it has been argued that all the tradition that John was at Ephesus was due to the confusion of the Apostle with a supposed presbyter and original disciple of Jesus bearing the same name. But all the positive evidence tends toward the association of John in his latest years with Ephesus. There is a fragmentary tradition that he went to Rome and was there plunged into a cauldron of boiling oil, from which he miraculously escaped unharmed, and that he was then banished to an island. John, the author of the Apocalypse, speaks of himself as being "in the isle that is called Patmos," and the date which is given by Irenæus and others for the exile of John the apostle is late in the reign of Domitian, and for his return the year 96, early in the reign of Nerva. There is no tradition as to the date of his death. Many legends are current as to his life at Ephesus. Irenæus tells of his hostility to the tenets of the Gnostic Cerinthus, such that John even refused to remain under the same roof with the heretic. Clement of Alexandria exalts his pastoral fidelity by a story how he journeyed into the forest to reclaim a young man who had fallen into evil ways and joined a band of robbers. Cassian relates that when he was censured for spending time in play with a tame partridge, he answered that the bow cannot always be bent. The story, however, which is most familiar, is due to Jerome, who tells that, when so aged that he must be carried into

church and was unable to speak at any length, John would continually repeat, "Little children, love one another." Perhaps partly based on this story, partly perhaps on an impression gained from a superficial reading of his letters, the notion has widely prevailed that John was a weak sentimentalist. But this is unjust. It has been profoundly said of his epistles that their words are thunderpeals, and it is plain that in his soul burned the fires of passion and power which made him in his youth one of the "Sons of Thunder," although in his age he had learned repression and self-mastery.

DAVID FOSTER ESTES,

*Professor of New Testament Interpretation,  
Colgate University.*

**Saint John, Charles Edward**, American physicist: b. Allen, Mich., 15 March 1857. He was graduated at the Michigan Normal College in 1876, and studied physics at Harvard and at the University of Berlin. He became instructor of physics at Michigan Normal College in 1885; was made associate professor at Oberlin College in 1897, and in 1899 became professor of physics and astronomy at that institution. He has written 'Wave-Lengths of Electricity on Iron Wires' (1894); 'A Study of Silphium Perfoliatum and Dipsacus Laciniatus in Regard to Insects' (1887).

**Saint John, Frederick Edward Molyneux**, Canadian journalist and author: b. Newcastle, England, 26 Nov. 1838. His father was one of Wellington's veterans at the battle of Waterloo, and the son followed him in a military career, on 23 April 1855 entering the Royal Marines (Light Infantry) as second lieutenant. He served under General Van Straubenzie throughout the operations against Canton in 1857-8, and acted with such gallantry under fire during the storming of the fort that in August 1858 he was promoted first lieutenant. In 1868 he came to Canada and being a member of the staff of the Toronto 'Globe' was appointed in 1870 to accompany Col. Wolseley's Red River expedition, and later served with Lord Dufferin on his tour of British Columbia. Upon the forming of the Northwest Territories, he became the first clerk of the Legislature, the first secretary of the Protestant Board of Education and later was appointed sheriff and Indian commissioner. In 1879 he returned to England, where in 1884 he became the first emigration agent and London secretary to the Canadian Pacific Railway. He was at different times editor of the Winnipeg *Standard*, the Montreal *Herald*, and the Manitoba *Free Press*, and in 1888 was president of the Ottawa Press Gallery. He has published: 'A Sea of Mountains,' an account of Lord Dufferin's tour (1877); and 'Under the Mistletoe,' a society play.

**Saint John, Henry.** See BOLINGBROKE, VIS-COUNT.

**Saint John, James Augustus**, English author and traveler: b. Carmarthenshire, Wales, 24 Sept. 1801; d. London 22 Sept. 1875. At 16 he went to London and engaged in newspaper work, and in 1827 started the 'Weekly Review.' He lived much of his life abroad, in France, Switzerland, Egypt, and elsewhere, and found material in his travels for many of his works. He contributed to 'Constable's Miscellany' in

## SAINT JOHN — SAINT JOHN RIVER

1830 a 'Journal of a Residence in Normandy' and wrote 'Egypt and Mohammed Ali' (1834); 'Anatomy of Society' (1831); 'Manners and Customs of Ancient Greece' (1842); 'Egypt and Nubia' (1845); 'Views in the Eastern Archipelago' (1847); 'Isis, an Egyptian Pilgrimage' (1853); 'Philosophy at the Foot of the Cross' (1854); 'Nemesis of Power' (1854); 'Preaching of Christ' (1856). He also wrote 'Lives of Celebrated Travelers' (1831), a biography of 'Louis Napoleon' (1857), an elaborate 'Life of Sir Walter Raleigh' (1868-9); etc.

**Saint John, Sir Spencer**, English diplomat, son of J. A. Saint John (q.v.); b. London, 22 Dec. 1825. In 1848 he was appointed secretary to Sir James Brooke in Borneo, in 1850 became secretary to the mission to Siam, and during 1855-61 was consul-general in Borneo. During the years 1861-66 he was consul successively in Haiti, Lima, Bolivia, Mexico, and Stockholm. He was knighted in 1881. He has published 'Life in the Forests of the Far East' (1862); 'Life of Sir James Brooke, Rajah of Sarawak' (1876); 'Hayti, or the Black Republic' (1885); 'Rajah Brooke' (1899).

**Saint John**, one of the Virgin Islands, Danish West Indies, lying east of Saint Thomas (q.v.); area, 21 square miles. It is of volcanic origin and hilly; only a small portion of the land is cultivated; sugar is the chief agricultural product. Cattle are raised and exported, and bay rum is also exported. Coral Bay, on the east coast, is one of the best sheltered and safest harbors of refuge during hurricanes in the Antilles. The island was included in the treaty of 1902 for the purchase of the Danish West Indies by the United States, which was rejected by the Danish Folkething. Pop. 925. See WEST INDIES, DANISH.

**Saint John**, West Indies, the capital of Antigua; situated on the northwest coast, stands at the head of a safe but small bay. The residence of the English governor-in-chief is the principal building. The staple of the island is sugar, which, together with pineapples, forms the chief export trade.

**Saint John**, Canada, city and county-seat of Saint John County, New Brunswick, situated at the mouth of the Saint John River on the shores of the Bay of Fundy; on the Canadian P., the Intercolonial, and the Shore Line R.R.'s.; 450 miles from Boston, 480 from Montreal and 275 from Halifax. It is the Atlantic terminus of the Canadian Pacific Railway.

**Shipping Interests.** — The harbor of Saint John can be entered by ships of any size and has ample accommodations for a very large number. It has always been the principal port in New Brunswick for the shipment of lumber, for it naturally commands the trade of the Saint John River and its tributaries, which flow through one of the great forest regions of the continent. The port is becoming the great winter port of Canada and there are now three elevators, and connected with them berths for seven large steamships which can all be loading or discharging at the same time. Other wharves are being built for the growing trade of the port, the exports of which now amount to \$25,000,000 annually and which are likely every year to increase. The development of the West is making Saint John a very important shipping port and the outlet for

a large proportion of the products of the great prairie region beyond Lake Superior. During the year 1903, 2,724 vessels measuring 1,200,300 tons entered or cleared at Saint John in the foreign trade, and 1,236 vessels measuring 687,742 in the coasting trade. Seven lines of steamships run from St. John to Great Britain during the winter. There is also a line of steamships to Bermuda, Barbadoes, Trinidad, and Demarara.

Saint John has a steamboat connection with Portland, Me., Boston, Digby, Yarmouth, Grand Manan and other points on the sea coast, and with Fredericton and other points on the river.

**Business Interests.** — Saint John has become a considerable manufacturing centre, and has cotton mills, iron and brass foundries, nail factories, rolling mills, a broom and brush factory, flour mills, and many other industries. The saw-mills at Saint John and vicinity employ about 2,000 persons and form its leading industry. Seven chartered banks and three private banks do business in Saint John.

**Public Works, Buildings, etc.** — Saint John has an electric railway system, electric lights and a splendid water and sewerage system. It has a large public hospital, fine modern school houses, exhibition buildings, free public library, and other public buildings of a similar character. Its custom house is said to be one of the finest in the world. The city has about 40 churches.

**History, Population, etc.** — The Saint John River received its name from Champlain, who visited it in the year 1604, and it was at that time the site of an Indian town. The French held possession of the country until the year 1713, when Acadia was ceded to Great Britain, under the Treaty of Utrecht. A fort was built in 1630 by Charles LaTour on the west side of the harbour, which was afterwards from time to time occupied by garrisons until the year 1700, when it was allowed to fall into ruin for about half a century, when, about the year 1758, it was taken possession of by the English and named Fort Frederick. The first English settlement at Saint John was in 1762 when Messrs. Simonds, Hazen, and White began business at what is now called Portland Point and engaged in the fisheries and in the manufacture of lime. In 1763, Saint John received a large accession to its population by the coming of the Loyalists, who had left the old Thirteen Colonies which had become independent. Saint John received a charter and became a city in 1785, and now has a population of 50,000.

JAMES HANNAY,

*Author of 'New Brunswick: Its Resources and Advantages.'*

**Saint John, Knights of.** See JOHN (SAINT).

**Saint John**, Lake, Canada, in the Chicoutimi district, Quebec, 200 miles by rail north of Quebec, a circular body of water, about 28 miles long and 25 miles broad, drained by the Saguenay River (q.v.). It receives the waters of the Metabetchouan, the Mistassini, the Peribonca, the Ashuapmouchouan, the Ouatchouan, and several smaller streams.

**Saint John River**, Canada, the largest river of the province of New Brunswick, has its source in the highlands of northern Maine. After a course of 446 miles, it empties into the Bay of Fundy through a rocky gorge about 600 feet wide.

## SAINT JOHN

It enters the harbor through a rocky and sharply defined gorge, having a total fall of about 17 feet. Throughout most of its upper course it forms the boundary between Maine and Canada. Near the sea it is navigable for large steamers and for 75 or 80 miles for smaller craft.

**Saint John, Mich.,** village, county-seat of Clinton County; on the Detroit, Grand Haven & Milwaukee railroad; about 20 miles north of Lansing and 100 miles west-northwest of Detroit. It is in an agricultural region and it has considerable manufacturing interests. The chief manufactures are a large table factory, grist mills, lumber mills, carriage work, machine shop, and foundry. There is considerable trade in manufactures and farm products. The three banks have a combined capital of \$185,000. The educational institutions are a high school, public graded school, and a library, which is under the auspices of the Ladies' Library Association. Pop. (1910) 3,154.

**Saint John's, Newfoundland,** the capital of the colony, situated on the east side of the island, opposite to the Atlantic, midway between Cape Race and Cape Bonavista, in N. Lat. 47° 33' 54", and W. Long. 52° 40' 18". It is distant 1,691 miles from Cape Clear (Ireland), 1,213 from New York, 885 from Boston, and 488 from Halifax, N. S. The harbor is completely landlocked, with good holding ground, and is entered by a short passage, known as the "Narrows," between high beetling cliffs. The town is situated on the north side of the harbor.

**Communication**—Saint John's is the terminus of the Newfoundland Railway, which runs across the island to Port Aux Basques, from whence the palace steamer "Bruce" connects three times a week with Sidney, C. B. It is expected that the Reid Newfoundland Company will soon convert this into a daily service each way. There is a steamship line to Liverpool, England, carried on throughout the year by the Furness Line; to Glasgow, from April 10 January, by the Allan Line; to New York, by the Red Cross Line; to Philadelphia and Halifax, N. S., by the Allan, Red Cross, and Furness Lines; to Montreal, Prince Edward Island, and Sydney, C. B., by the Black Diamond Line, and freighting steamers. Constant communication is maintained with all parts of Newfoundland and Labrador by the fine steamers of the Bowring and Reid Lines. Each bay has also a local steamer running in connection with the railway.

**Shipping Interests**—Saint John's is not only the capital of the colony but the centre of all the business and financial interests of the island and Labrador. Three Canadian banks, Bank of Montreal, Bank of Nova Scotia, and Royal Bank, have their headquarters in the city. All the principal merchants reside here, all the supplies for the chief business, the fishery, are bought in Saint John's, and the great bulk of the exports shipped from the capital, 90 per cent. of the duties being paid and the revenue collected in Saint John's; 991 vessels of 720,332 tons entered and cleared during the year 1905.

At the head of Saint John's harbor there is a splendid dry dock, built by the government, but now leased to the Reid Newfoundland Com-

pany. It is capable of taking up the largest ships. There is ample warehouse room and the Reid repairing shops are equipped with all the best modern machinery.

**Manufactures.**—There are several important factories, one of the largest being a rope walk, also biscuit factories, oleomargarine factories, tanneries, breweries, lumber factories, foundries, a large tobacco factory, and an extensive boot and shoe factory, with several minor establishments. The most extensive business is connected with the curing and drying of codfish for foreign markets, about \$8,000,000 worth of fishery products being shipped every year. Seal, cod, and whale oil are manufactured and guano from the whale refuse. Between 300,000 and 400,000 skins of the hair seal are sold to be manufactured into leather and fur abroad.

**Public Works, Buildings, Etc.**—The Capital of Newfoundland has an electric railway, electric light, and owing to recent improvements one of the finest water services of any town in America. There are very complete telephone and telegraph lines, one belonging to the Anglo-American Telegraph Company, the other to the local government. The town possesses a large public hospital, convalescent home, lunatic asylum, poorhouse, a large Roman Catholic Cathedral, and an Anglican Cathedral, one of the most beautiful of churches, a masterpiece of the late Gilbert Scott, which has lately been restored after being destroyed by fire in 1892. The Customs-house and Courthouse are commodious, but not picturesque. Government House has fine grounds, but the building is very plain. There is no Public Library in the Capital, the town having refused a most liberal offer from Mr. Carnegie.

**Education.**—The education is strictly denominational, even the Salvation Army having separate schools. The Anglican, Roman Catholic, and Wesleyan bodies have very fine Colleges and good Schools, but no University.

**History.**—Owing to its unrivalled position in the centre of the great cod-fishing grounds, Saint John's became, from the date of the discovery of North America, in 1497, the centre and metropolis of this great industry. The date of its foundation cannot be exactly determined. Its first inhabitants were part of the fishing ship's crews left behind to build boats, houses, stages, etc., for the fishery. There were 20 houses in Saint John's in 1530. In 1583, Hayes, the survivor of Gilbert's ill-fated expedition, speaks of the town as a "place very populous and much frequented." A large barter trade was carried on between the French, Portuguese, Spanish Basques, and the English fishermen, the principal traffic consisting in selling for cash, or bartering for fish and oil. Mediterranean products, salt, olive oil, fruits, wines, etc., were exchanged for the then as now famous West of England cloth, cordage, cloth caps, and hosiery, and the well-known Sheffield cutlery. There were 20,000 men engaged in this early transatlantic fishery, and the trade was one of the most important of the Tudor age. The American colonists began trading with Newfoundland as early as 1641. By the time of the Revolution, Saint John's did a business of \$4,000,000 with the United States, mainly through Boston and New England.

## SAINT JOHNS--SAINT JOHN'S COLLEGE

The town was twice invaded by the French and destroyed by them and their Indian allies. It was recaptured in 1762, by Colonel William Amherst, with the Highlanders and Royal Americans, the last and most gallant fight of the great Seven Years' War. Saint John's was built entirely of wood and has been several times utterly destroyed by fire, once in 1817, again in 1846, and partially in 1892. It has been greatly improved of late years and is now built chiefly of stone and brick and is a well-laid-out city with Roman Catholic and Anglican Cathedrals, numerous other places of worship, Colleges, Schools, Town Hall and Courthouse combined, Parliament House, and other buildings.

**Government and Population.**—Saint John's is governed by an elected mayor and an elected municipal council of six members. As usual the city debt is large, amounting to \$1,187,322. The total amount of the revenue of the city is \$150,000. The population by the last census (1901) was 29,594, for the city; with the districts of Saint John's East and West, 39,995, divided as follows: Roman Catholic, 21,576; Anglican, 9,556; Wesleyan, 6,737 and other denominations about 2,000.

D. W. PROWSE,

*Author of 'The History of Newfoundland, from the Records.'*

**Saint Johns, Quebec,** a town, the county-seat of Saint Johns County, situated on the Richelieu River, 27 miles southeast of Montreal. It is a port of entry and a station on the Grand Trunk, Canadian Pacific, and Central Vermont R.R.'s. The principal manufactures are earthenware and silk goods. Large quantities of lumber and agricultural products from the lower Champlain region are exported through Saint Johns, the exports amounting to nearly \$3,000,000 annually.

**Saint Johns,** a river in Florida; the source, Lake Poinsett in Orange County, is about 12 miles from the Atlantic Ocean. The river flows north, nearly parallel with the coast, and enters the Atlantic about 15 miles northeast of Jacksonville. The total length is about 350 miles. It flows through swamps, ponds, and lakes; luxuriant vegetation is along its banks the greater part of the course. In some places are large trees, their green foliage intermingled with feathery brown and gray mosses which hang down to the ground. Reptiles are numerous in the marshes. In the north part of its course the land is higher and dryer. It is navigable to Enterprise in Volusia County. See **FLORIDA**.

**Saint John's Broad.** See **CAROL-TRER**.

**Saint John's College,** an institution located at Toledo, Ohio, under the direction of the Fathers of the Society of Jesus. The college was opened in September 1898, was incorporated on 22 May 1900 and on 29 Aug. 1903 the power to grant degrees, under an amended charter, was ratified by the Secretary of State. The college is divided into academic and collegiate departments. The academic department consists of a four years' course in the study of English composition and literature, Latin and Greek, algebra, history, German, elocution, and the principal business courses. The collegiate course is known as the college course of liberal arts, which, including mathematics, natural

science, a higher course in religion, a study of history from the Catholic viewpoint, and a course in mental philosophy, leads to the degree of B.A. French and Spanish, drawing and typewriting, are also taught. There is also a meteorological observatory connected with the college. In 1904-5 the students numbered 157; the faculty, 15; volumes in the library, over 2,000.

**Saint John's College, Cambridge, England,** was founded by Margaret, countess of Richmond and Derby, mother of King Henry VII., in 1511, mainly through the exertions of Fisher, bishop of Rochester, then chancellor of the university, who raised sufficient funds to endow 32 fellowships. The college replaced Saint John's Hospital founded in the 12th century, and now consists of a master, at least 56 fellows, 60 foundation scholars, and nine sizars; both fellowships and scholarships being open to all British subjects. Five fellowships are professorial fellowships to be held by professors of the university. There are three divinity studentships of the value of about \$400, tenable for three years, and open to the competition of Bachelors of Arts not of sufficient standing to take the degree of M.A.; also four law studentships of the value of \$450, tenable for four years; and a Hebrew scholarship of the value of \$160, tenable for three years. Some \$33,500 are expended annually in assisting deserving students of the college, and there are a number of prizes which are awarded on the results of the annual examinations. The college has the patronage of 52 church livings. The buildings include four courts chiefly of brick; the new court (1826) across the Cam, built of stone, is united by an ornamental covered bridge, commonly called the "bridge of sighs," with the third court. The chapel (1869) is by Sir Gilbert Scott, and is a fine specimen of the Early Decorated style. The combination-room, 93 feet long, and the library (1623), are curious and striking. Ascham, Ben Jonson, Bentley, Rowland Hill, Wilberforce, Wordsworth, and Lord Palmerston were members of the college.

**Saint John's College, Oxford, England,** a college founded in 1555 by Sir Thomas White, a London alderman, for a president, 50 fellows and scholars, a chaplain, an organist, six singing men, eight choristers, and two sextons. Some of the buildings belong to the earlier college or Saint Bernard dating from about the middle of the 15th century. With buildings added at subsequent dates the whole form a picturesque group. Under the present statutes the college consists of: (1) Not less than 14 nor more than 18 fellowships, of which seven may be official fellowships, the rest tenable for seven years. To these may at future times be added two *ex-officio* fellowships to be held by the Laudian professor of Arabic and the professor of civil engineering. (2) Not less than 28 scholarships, of which six shall be open, 15 appropriated to Merchant Tailors' School, two to Coventry School, two to Bristol School, two to Reading School, and one to Tunbridge School. (3) Four senior scholarships confined to former pupils of Merchant Tailors' School. There are also the Holmes Scholarship, tenable for five years; the Lambe Scholarship, tenable for four years; the four Casberd scholarships of \$400 each per

## SAINT JOHN'S COLLEGE—SAINT JOHN'S-WORT

annum, and certain exhibitions for undergraduates not on any foundation, and of at least one year's standing in the college. There are also four fellowships, tenable for 14 years, open with certain limitations and under certain conditions in respect of literary proficiency, first to the kindred of the founder, Dudley Fereday of Ettingshall Park, Stafford, secondly to natives of Staffordshire, and then to any other person whatsoever. Thirty-three church livings are in the patronage of the college.

**Saint John's College**, located at Annapolis, Md. It was chartered in 1784, and opened to students in 1789, but is the direct successor of King William's School (founded 1696), which in 1784 was merged into the college, thus being one of the oldest institutions of collegiate grade in the United States. The work of the collegiate department is arranged in four courses, classical, Latin-scientific, scientific, and mechanical engineering; in each course certain studies are required and others are elective. The degree of A.B. is conferred for the completion of the classical and Latin-scientific courses; the degree of B.S. for the scientific and mechanical engineering courses. Graduate work is provided for, leading to the degree of A.M., and there is a preparatory school. Instruction in military science and military drill are a part of the curriculum, required of all students. The State provides one full State scholarship for each senatorial district, and in addition 26 scholarships for tuition only, to be distributed among the counties in order of priority of application; there are also other scholarships. In 1904, the grounds and buildings were valued at over \$250,000; Henry Williams Woodward Hall, the new science building, was erected in 1900; the library in 1910 contained 8,200 volumes. The annual income of the year 1910 was \$70,000; the students numbered 190, and the faculty 14.

**Saint John's College**, an institution in New York, opened 24 July 1841, under the auspices of the Roman Catholic Church. The land upon which the college stands is a part of the old Dutch village of Fordham, and is of historic interest. In 1639 the land between the Harlem and Bronx rivers was purchased by the Dutch West India Company, from three Indian sachems. In 1694 the land which is now the college property came into possession of the Corsa family. The farm was known as "Rose Hill," a name which still clings to the place and by which the college was known in earlier years. In 1787 the "Rose Hill" farm was purchased by John Watts and later it passed through several owners to Horatio Shepherd Moat. In 1838 Moat built the stone house which is now the central college building, and which contains the principal offices and the reception room. In 1839 the new house and a farm of 80 acres was purchased by John Hughes (q.v.), the coadjutor bishop of New York, for \$29,750. John McCloskey (q.v.) was first president, and for the five years the college was in charge of secular priests, four clergymen, who afterward became bishops, three who became archbishops, and one a cardinal, were associated with its government or were members of the faculty. On 10 April 1846 the Act of Incorporation was passed which made the school a university with power to grant all degrees usually granted by a

university. In 1846 and 1850 the Fathers of the Society of Jesus bought the buildings and a portion of the 80-acre tract and took charge of the college. It still (1910) remains one of the Jesuit schools. The area of the college grounds is about 70 acres, bounded east and south by Bronx Park (q.v.). The group of gray stone buildings presents an attractive and imposing appearance; the 1904 addition to the buildings, a hall built on the site of the "Rose Hill Manor House" (1690), cost about \$130,000.

The college includes four departments under the same management; the college department furnishes the usual four-year course leading to the degree of B.A.; the academic furnishes a four-year course and prepares for college; the commercial, and the preparatory departments. There are seven scholarships, which have been endowed by friends of the school who designed to aid worthy students. Social life as well as intellectual is fostered by the various college societies. The number of pupils in attendance, in 1910, was 648. Some of the noted alumni are Archbishop Farley, of New York, Mgr. J. F. Mooney, vicar-general of New York, Bishop Hendricks, of Cebu, Philippine Islands, Morgan J. O'Brien, New York, and John T. McDonough, supreme court justice, Philippine Islands.

**Saint John's College**, located at Washington, D. C. It is the outgrowth of Saint Matthew's Institute, founded in 1870 by the Brothers of the Christian Schools (Roman Catholic); its name was changed to Saint John's Collegiate Institute in 1880, and to Saint John's College in 1887. The ideal of the college is to give a scientific and business education. There are three departments—collegiate, academic (secondary), and preparatory (elementary). The collegiate department offers two courses, English-science, leading to the degree of B.S., and commercial course, for completion of which a commercial diploma is granted. The English-science course includes instruction in French and German; drawing is taught in all three departments. The grounds and buildings in 1904 were valued at over \$150,000; the library contained 5,000 volumes. The students in 1910 numbered 225, the faculty 14.

**Saint John's Eve.** See JOHN'S, SAINT, EVE or.

**Saint John's River**, Quebec, the local name near the town of Saint John, of the Richelieu River (q.v.).

**Saint John's University**, in Collegeville, Minn., founded in 1857 and chartered the same year. It is a Roman Catholic institution in charge of the Order of Saint Benedict. In 1869 the school was granted power to give degrees; and in 1878 it was further empowered by Lea XIII. to grant the degrees of doctors in theology, philosophy, and canon law. In 1883 it received from the legislature of Minnesota the title of university. In 1910 there were connected with the school 36 professors and instructors, and 375 students. The courses lead to the degrees of A.B. and B.S. The preparatory department prepares for the university. There is connected with the school a business department.

**Saint John's-wort**, a large genus (*Hypericum*) of plants of the family *Hypericaceae*. They

## SAINT JOHNSBURY—SAINT JOSEPH

are to be found nearly everywhere in the temperate and torrid zones, and are often shrubs or small trees. The foliage is pellucid punctate or black-dotted, and the leaves and blossoms emit, when bruised, a strong, resinous-aromatic odor, and have a bitter taste, due to an oil possessing astringent and tonic properties, and which held a prominent place in old pharmacopoeias. The flowers are perfect and five-merous, borne solitary or in cymose panicles, and are generally yellow. *Hypericum perforatum*, to which formerly the name of Saint John's-wort was limited, has its leaves marked with pellucid dots, somewhat simulating perforations. It is a European plant which has become naturalized in our country, and is a troublesome weed. It is a very smooth, shining herb, sometimes two feet high, with opposite oblong leaves, and bright-yellow flowers in broad terminal cymes. Both petals and leaves are black-dotted. Its yellow, acrid resinous juice will stain the skin purple, and was believed by Dr. Torrey to cause inflammatory trouble in cattle. The dried plant dyed wool yellow.

Tradition states that the Saint John's-wort was so called because blood-like spots appeared on its foliage immediately after the Saint was beheaded, and re-appeared on the anniversary of the date. It was regarded as a universal panacea, and perhaps possessed some curative qualities, especially in external use. It was supposed to preserve persons and property against lightning, but was still more in demand as a preventive of witch-visits, or those of other evil spirits, perhaps because, according to tradition, a baptized person anointing the eyes with the green juice of its inner bark could see witches. Italians gave it the name of "devil-chaser." It was not only worn as an amulet, but was hung over doors and windows; yet it was not safe to tread on it after dark, since the luckless wight that bruised it might be snatched up on a fairy horse and carried about all night; Saint John's-wort, plucked on midsummer night's eve took its place among the love-charms.

**Saint Johnsbury, Vt.**, town, county-seat of Caledonia County, on the Passumpsic River, and on the Boston & M. and the Saint Johnsbury & L. C. R.R.'s, about 34 miles east-northeast of Montpelier. It was settled in 1786 by Jonathan Arnold; and incorporated in 1884. It is in an agricultural region in which there is considerable attention given to dairying; but the principal industry is the manufacturing of the Fairbanks scales. There are about 1,000 men employed in the Fairbanks Scales Works, and an equal number in the combined smaller manufacturing. There are nine churches and one hospital. The educational institutions are the Saint Johnsbury Academy, Notre Dame Academy, public and parish schools, Saint Johnsbury Athenaeum and a free library, and the Fairbanks Museum of Natural History. The four banks have a combined capital and deposits of \$2,000,000. The government is vested in a board of trustees. Pop. (1910) 8,098.

CHARLES A. WALTER,  
Editor (Saint Johnsbury Republican.)

**Saint Joseph, Mich.**, city, county-seat of Berrien County; on Lake Michigan, at the mouth of the Saint Joseph River, and on the

Cleveland, C. C. & St. L., the Père Marquette, and the Saint Joseph, S. B. & S. R.R.'s; about two miles south of Benton Harbor and 23 miles north by west of Niles. It has steamer connection with the Lake Michigan ports. It is in an agricultural region, noted especially for its peaches and other fruit. The chief industrial establishments are flour and grist mills, lumber mills, fruit-basket and box factories, machine shops, lumber mills. In the government census of 1900 there are given 75 manufacturing establishments, with 933 employees. The annual value of the products was \$1,308,277. There is an extensive trade in peaches, apples, and lumber. The two state banks have a combined capital of \$50,000. The educational institutions are a high school, public elementary schools, and a public library. Pop. (1910) 5,936.

**Saint Joseph, Mo.**, city and county-seat of Buchanan County, the third city in size and wealth in Missouri, and located on its western border on the east bank of the Missouri River, 131 miles southeast of Omaha.

**History.**—In 1826, Joseph Robidoux, born in Saint Louis of French parentage, established a trading post at this point known as the "Black-snake Hills," and thus became the founder of the city, which he later christened with his own name. For hundreds of miles on every side, the whole country was then an unbroken wilderness, inhabited only by the aborigines, who gained a scanty subsistence by trapping and hunting. The furs and pelts of the wild animals they killed soon became a source of extensive traffic between the trader and his Indian neighbors. The famous "Platte Purchase" was accomplished through a treaty with the Indians, dated 17 Sept. 1836. The trading post grew into a town, incorporated in 1845, and then into a city, incorporated in 1851. Its growth at first was not rapid, but steady and gradual. Planted, however, in the midst of one of the finest and wealthiest agricultural sections of the United States, and drawing to itself the larger part of the trade that came from the country to the westward, it later on began to assume a more vigorous and rapid growth. In 1880 it had a population of 32,431; (1890) 52,324; (1900) 102,979; and (1910) 77,403.

**Trade.**—The development and extension of the business and material resources of the city kept pace with its increase in population. As a distributing point for the entire West, from the Mississippi River to the Pacific Ocean, it has but few rivals, and, outside of Saint Louis and San Francisco, no superiors. It has about 50 large wholesale establishments engaged in all branches of trade, with over 1,200 traveling men in the field, selling goods to the retail merchants in almost every town and hamlet throughout this vast region of country lying to the westward. The volume of the jobbing business of the city for the year 1910 exceeded \$75,000,000, and the manufacturing output was over \$40,000,000. This is exclusive of the retail trade, which has been correspondingly large.

**Schools, Churches and Charities.**—The school census, taken pursuant to the requirement of State law, shows that the children of school age, from 6 to 20 years, number about 40,000. A large portion (12,553) are in actual attendance upon the public schools, housed in 43 public school buildings and taught by 330

## SAINT JOSEPH

teachers. The most imposing of the school houses now in use is the High School building, erected in 1894-5 on a commanding hill overlooking the city, and involving an expenditure of \$113,534. From it and its humble predecessor 1,107 graduates have been sent forth, since the establishment of a high school course in 1868. All the public school buildings, with the grounds on which they are situated, are valued at \$298,412. The attendance upon the private schools is likewise large, and the buildings used for that purpose correspondingly valuable. In the city are 66 church buildings, owned and used by the different denominations as follows: Baptist, 11; Christian, 4; Jewish, 2; Congregational, 2; Episcopal, 4; Lutheran, 3; Evangelical, 2; Methodist Episcopal, 11; Methodist Episcopal South, 7; Presbyterian, 8; Catholic, 8; Reformed, 1; Unitarian, 1; Christian Science, 1; Latter Day Saints, 1. The aggregate value of this church property is in excess of \$1,000,000. The Young Men's Christian Association building was erected in 1886-7 at a cost of \$60,000, and four years later the Young Women's Christian Association took possession of its handsome home on 10th Street. The Memorial Home for the support and care of helpless and needy old people, and the Home for Little Wanderers, for the sheltering and rearing of poor and neglected children, built and endowed by charitably disposed citizens at an outlay of nearly \$100,000, are substantial structures, worthy of their founders and supporters. The most important charitable institution, however, in Buchanan County, is Hospital No. 2, for the care of the insane, located just east of the city limits, erected and sustained by the State. The original building, which was erected in 1873 at a cost of \$200,000, burned down in 1879, but was at once rebuilt, and has since been added to and improved at a total cost of about \$500,000. The institution, which is a very capacious and imposing structure, has a capacity of 1,350 patients, and requires the services of 205 employees. It is modern in all its appointments, and its management has always been a model of excellence.

**Public Buildings.**—The court-house, built anew in 1873-5 at a cost of \$173,000, injured by fire and rebuilt in 1885, is in the shape of a Maltese cross, and is a very imposing and capacious structure. Here two divisions of the circuit court, a criminal court, a county court, a probate court and several inferior courts are in continuous session most of the year. Here also are located the offices of the county officials. The United States circuit and district courts are held in the Federal building, finished in 1890, involving in its erection an expenditure of \$345,000. In this building are also located the post-office, the United States internal revenue office and the surveyor of customs and his assistants. Even thus early after its completion the building has been found to be wholly inadequate to meet the demands of the public service; and Congress in 1903 appropriated \$225,000 for the purpose of enlarging it to more than double its present size and capacity. There are now in the post-office proper 80 employees, whose yearly salaries aggregate about \$36,000. The receipts of the post-office for a single fiscal year aggregated approximately \$200,000. The receipts at the South Saint Joseph post-office, located in the stock yards

district, amounted to \$19,240 for the same period. A city-hall and market house was erected in 1873 at a cost of \$50,000, which serves the purpose of a market place on the ground floor, and of offices for the numerous city officials in the upper stories. The city is the owner of two public library buildings, one erected in 1902 in the southern part of the city, at a cost of \$25,000—the other erected in 1900 in the central part, at a cost of \$106,534. Though in their infancy, there are 27,500 volumes on the shelves of these libraries, accessible to the free use of the reading public. Saint Joseph has two large opera houses of modern construction and equipment, with a seating capacity of 1,785 and 1,740, respectively, beside a large number of smaller places of amusement. The Commercial Club, assisted by the Board of Trade, looks after the commercial interests of the city. Both organizations occupy the Chamber of Commerce, built in 1884-5 at a cost of \$105,000. Almost \$100,000 have been already subscribed toward the building of a Convention Hall. This subscription is expected to be largely increased in the course of the next few months, when the work of building will be commenced. The city has 50.68 miles of paved streets, 59.33 miles of main and district sewers, a number of hotels and hospitals, one convent, two elevators, several flouring mills, many factories and five parks, all except one being small in size, but all in an excellent state of improvement. There are 21 newspapers published in Saint Joseph, 5 daily, 9 weekly and 7 monthly.

**Light and Water Plants.**—The city owns an electric light plant, representing in its construction an expenditure of over \$100,000, and which will be enlarged in the near future to twice its present capacity, in order to meet the demands for additional street lighting, resultant from the recent growth of the municipality. In 1902 there was consumed in the city 120,000,000 feet of gas, at a cost to the consumer of \$1.00 per thousand cubic feet. The gas plant, which was built in 1876 and has been in almost continuous extension and improvement since that time, now represents an investment of about \$1,000,000 of money expended in construction. It has in use 56 miles of main pipe and has a capacity of furnishing 2,000,000 cubic feet of gas every 24 hours. Saint Joseph is supplied with water through an extensive system of waterworks, first built in 1879, and improved and extended since that time, until it now represents in cost of construction an expenditure of over \$1,800,000. The water is pumped from the Missouri River, at a point about three miles above the city, into reservoirs and settling basins, located on a hill 317 feet above the level of the river, and is clarified and purified by means of these basins and the Jewell system of filtration. It is then emptied into water mains, which now aggregate 92 miles in length, and is carried by the force of gravitation to the fire hydrants, 794 in number, and to the myriad points of distribution for the consumers throughout the city.

**Railroads.**—Saint Joseph has 38 miles of electric street railway, with an extensive electric plant connected therewith, to furnish the motive power for its operation. The equipment of cars, both in number and perfection of construction, is such as to satisfy the demands of street railway travel. By a systematic course of super-

## SAINT JOSEPH → SAINT JOSEPH'S SEMINARY

vision and improvement the whole system has been kept at all times in splendid condition. In 1902 there was a change of ownership in the street railway plant, the purchasers paying therefor as an investment the sum of \$4,000,000. The city is connected with the outside world by nine railroads, including one the construction of which began in 1903. Three lines run to Chicago, three to Kansas City, two to Saint Louis, two to Omaha, one to a connection with the Union Pacific railroad at Grand Island, Neb., and two others traverse that vast territory lying to the west and southwest. Most of them use the Union Station, erected in 1896 at a cost of \$126,000. During the year ending 1 Sept. 1903 there were 438,800 pieces of baggage handled at this station. Two of the railroads centering in the city cross the railroad, wagon and foot bridge, which spans the Missouri River at this point, built by the city in 1872 at a cost of \$716,000. This bridge is about to be enlarged by the two railroad companies using it, so that it will be greatly strengthened and its capacity doubled.

**Stock Yards.**—A great impetus was given to the growth and prosperity of the city by the improvements and extensions made at the stock yards located at this point, which were begun in the year 1897, and which have been carried on extensively ever since. The stock yards proper consist of 500 acres of land, 80 acres of which are covered by the pens and sheds. There are 20 miles of railroad tracks upon the grounds, and five packing houses engaged in the slaughtering of animals, three of them, Swift & Company, Nelson, Morris & Company, and the Hammond Packing Company have erected large and extensive plants here at a cost of several millions of dollars. A part of the Hammond Packing Company's plant was burned 5 July 1903, but is now being rebuilt on a much more extended plan than before. During the 12 months, ending 1 Sept. 1903, there were slaughtered by these houses 645,694 cattle, 1,681,784 hogs and 637,033 sheep, a large increase, except in the killing of hogs, over the business of the preceding year. During the same period there were 21,407 horses and mules bought and sold, and 51,642 cars of stock handled at the stock yards. There is also a packing house at this point located outside of the stock yards, which does a large business, not included in the foregoing statement.

**Financial.**—There are nine incorporated banks doing business in Saint Joseph, three national and the other six organized under the banking laws of the State. The Comptroller of the Currency at Washington and the Secretary of State at Jefferson City called for statements from these banks, showing the conditions of their business on 9 Sept. 1903. All responded, making their statements under oath, from which it appears that the entire resources of all the banks in the city, at the close of business on that day, was \$19,478,855.19, and that they had on deposit \$17,371,533.20. The clearings of all the banks belonging to the clearing-house for the 12 months ending 30 Sept. 1903 aggregated \$293,407,800. The city had a public debt (1910), less sinking fund in the treasury applicable to its payment, of \$1,202,230. This outstanding indebtedness is in bonds, bearing 3½ and 4 per cent interest in about equal proportions for each rate. There is no floating debt, the city charter

prohibiting the contracting of any debt, without there being money in the treasury with which to pay it. The assessed valuation of property in the city, made upon a basis of about 40 per cent of its actual value, is \$37,743,450.

**Government.**—Saint Joseph is governed by a mayor, elected for two years, who is the chief executive officer of the city, and by a common council, entrusted with the enactment of all municipal legislation, whose members are elected for four years, one member from each ward of the city, but chosen by the voters of the whole city, the terms of one half expiring every two years. The city has also a board of public works, charged with originating and recommending to the council all ordinances for the improvement of the streets and other public works, and superintending the construction thereof. This board is appointed by the mayor, comptroller and auditor, not more than two members of which can belong to the same political party. There is also a board of park commissioners, to which is committed the custody, improvement and management of the parks, and a board of police commissioners, appointed by the governor, which has charge of the selection and control of the police force and the enforcement of the police regulations. The public schools are controlled by a school board consisting of six members, one half chosen from each of the two leading political parties, so as to free the management of the schools as much as possible from partisan bias. They serve without pay, and their terms of office are so arranged that two of them expire every two years. The fire department, under the control of the mayor and council, consists of a chief, his assistant and 70 firemen, located in 12 firehouses, distributed throughout the city, and equipped with all the engines, hose, ladders and other appliances needed for extinguishing fires.

**Bibliography.**—Barns, 'The Commonwealth of Missouri' (1877); 'Encyclopedia of the History of Missouri' (1901); 'History of Buchanan County, Missouri' (1881); 'Buchanan County and Saint Joseph' (1898); 'Saint Joseph Directory' (1903).

B. R. VINEYARD,  
Saint Joseph, Mo.

**Saint Joseph**, an island belonging to the province of Ontario in Canada. It is at the mouth of Saint Mary's River, and near the mainland of both Michigan and Ontario. There are many high bluffs and large rocks on the coast, but nearby the whole of the surface is covered with trees, shrubs, and flowers.

**Saint Joseph**, (1) A river in Michigan whose source is in Hillsdale County. It flows west-northwest, then south into Indiana, west, then northwest, returning to Michigan and entering Lake Michigan at Saint Joseph (q.v.). South Bend, Ind., is on the banks of this river, at the head of navigation. Its total length is about 250 miles. (2) Another river of the same name rises in the southwestern part of Michigan, crosses the northwestern corner of Ohio, enters Indiana, and flows southwest and unites with Saint Mary's River at Fort Wayne, to form the Maumee (q.v.). Its total length is about 100 miles.

**Saint Joseph's Seminary**, a theological school at Yonkers, N. Y. The local name for the place is Dunwoodie. The seminary belongs

## SAINT-JUST—SAINT LAWRENCE RIVER AND GULF

to the archdiocese of New York, but the attendance is not limited to any locality. The history of the school begins as far back as 1833, when Bishop Dubois began at Nyack, N. Y., the erection of a school on the plan of Mount Saint Mary's (q.v.), Emmitsburg, Md. The corner stone was laid 29 May 1833. But the institution was destroyed by fire before it was finished. Later the project of establishing the school in Brooklyn was proposed, but soon abandoned. The next location, selected by Bishop Hughes, was Lafargeville, Jefferson County, N. Y. A school was opened here, 20 Sept. 1838; but it was soon abandoned, as it was too far from New York. The Lafargeville school was intended for both theological and secular studies. The school was removed to Fordham, N. Y., in 1840 and is now known as Saint John's College (q.v.). The theological department was moved, October 1864, to a new home, and Saint Joseph's Seminary, Troy, N. Y., was opened in charge of professors from the University of Louvain, Belgium. The present seminary at Yonkers is on a beautiful tract of land, and built on the eminence known in history as Valentine Hill. The land was purchased in 1890 by Archbishop Corrigan (q.v.), and the new seminary was dedicated 12 Aug. 1896, and placed in charge of the Sulpician Fathers. In May 1898, one of the gifts presented to Archbishop Corrigan in honor of his silver jubilee was the certificate of the entire liquidation of the debt upon the seminary. The seminary chapel was built entirely at the personal expense of Archbishop Corrigan.

The conditions for admission are (1) a well-formed desire to study for the priesthood, (2) entrance examination, (3) must have completed a good classical course, (4) the permission of the bishop of the diocese to which the applicant belongs. The courses of study demand a large amount of work: as, the course in Sacred Scripture is for five and one half years, and the regular class work is supplemented by an academy or seminary composed of interested students who meet once a week to discuss particular questions. In connection with this department there are two courses of Hebrew, and instructions are given in other Semitic languages. All the other courses are equally thorough. In addition the students regularly visit hospitals, penal and charitable institutions, and teach in Sunday schools. In 1910 there were connected with the seminary 13 professors and instructors and 161 students. The library, in the centre of the main building, contains about 30,000 bound volumes.

**Saint-Just**, *sân zhüst*, Antoine Louis de, French patriot: b. Decize (Nièvre) 25 Aug. 1767; d. Paris 28 July 1794. He studied law at Rheims, but devoted himself almost exclusively to literary pursuits until the outbreak of the Revolution, when he became one of its most notable participants. His political career as deputy from Aisne to the convention at Paris in 1792 began with his famous oration setting forth his reasons for voting for the death of Louis XVI. Because of his youth he has been called the instrument of Robespierre, with whom he was closely associated throughout the Revolution. But the extreme measures attributed to him were undoubtedly undertaken

through intensity of personal conviction. In 1793 he was made president of the Convention, and in 1794 was responsible for the execution of Danton, Hébert, and Desmoulins. But the Revolutionary Tribunal, whose acts he had so mercilessly directed, was destined to be dissolved. In July 1794 Robespierre and Saint-Just were executed upon the same scaffold by order of the Committee of Public Safety. The political works of Saint-Just were published in 1833-4. Consult: Fleury, 'Saint-Just et la Terreur' (1851); Hamel, 'Histoire de Saint-Juste' (1859); Aulard, 'Les Orateurs de la Législative et de la Convention' (1879-81).

**Saint Kilda**, Scotland, an island of the outer Hebrides, belonging to Harris in Inverness-shire and lying 40 miles west of North Uist. It is three miles long by one mile broad with shores rising in perpendicular cliffs from the water's edge. The highest point is Conna-Ghair, a gigantic precipice 1,220 feet high. The richness of the verdure softens an otherwise bleak and forbidding landscape. There are about 40 acres of arable land, and sheep are raised. Sea-birds, petrels, etc., which supply feathers, oil, and meat, form the chief source of income. The fisheries are productive but neglected. The population from 110 to 1851 had dwindled to 71 in 1891. The natives speak Gaelic and inhabit a little village at the head of East Bay.

**Saint Kitts**, West Indies. See **SAINT CHRISTOPHER**.

**Saint-Lambert**, Jean François, zhôn frân-swâ sân lân-bâr, MARQUIS DE, French philosopher and poet: b. Nancy, France, 26 Dec. 1716; d. Paris 9 Feb. 1803. He was for many years attached to the court of Stanislaus of Poland when that prince lived in Lorraine, and for a time he served in the French army. He won literary recognition by a volume of descriptive verse, 'Les Saisons' (1796), which received extravagant praise at the time but possessed little merit. His present fame seems to rest upon the fact that he was the successful rival in love of both Voltaire and Rousseau. His 'Fugitive Poems' (1759) and 'Stories' (republished 1883) possess considerable merit, and his 'Universal Catechism,' though somewhat materialistic, was approved as a text-book on ethics by the Institute in 1810.

**Saint Lawrence**, *lâ'rên*, an island belonging to Alaska, in Bering Sea, intersected by lon. 170° W. and lat. 63° N. It is about 100 miles long and 34 miles wide, and is about 500 feet, at the highest point, above the sea. It is inhabited by Eskimos who are engaged chiefly in fishing.

**Saint Lawrence**, Cape, Canada, the north-west projection of Cape Breton Island, Nova Scotia, on the Gulf of Saint Lawrence.

**Saint Lawrence River and Gulf**. The Saint Lawrence River is in North America; its head-waters are about lon. 93° W., and its mouth near lon. 66° W. The total length from the source of the Saint Louis in Minnesota to its entrance to the Gulf of Saint Lawrence at Anticosti Island is 2,200 miles. The area of the basin is about 530,000 square miles. The area of the water surface of the Saint Lawrence River system, including all the rivers and lakes,

## SAINT LAWRENCE RIVER AND GULF

is 95,300 square miles. The area of that portion of the basin which is drained by the Great Lakes is nearly 200,000 square miles. The length of the shore line of the Great Lakes and their rivers is 5,400 miles. This system is the only large one in North America whose main stream flows from west to east, and the only large system, except Columbia, whose main stream does not run in the direction of the greatest extent of the continent.

**Formation of Lakes.**—Prior to the Glacial period the land area of this region was greater than at present, and broad valleys were excavated by the rivers. With but few exceptions the last formed rocks in this great depressed region belong to the latest formations of the Paleozoic strata. The whole region was under ice-cover during the Glacial period. This vast body of ice moved southward, elevations were worn down, the rocks were carved in fantastic designs, new grooves were formed, and the entire topography was changed. In addition to change of form produced by the movement of the great mass of ice, other and equally great changes were made by the vast amount of debris deposited by the glacial drift. Of this debris one peculiar formation is found in the rocks in Ohio, western New York, and other places, where angular and somewhat rounded stones are imbedded in boulders or striated with rocks. Another is the arrangement of the boulders, showing in many places their removal from their original beds. Sand, clay, and gravel, were washed by the streams into long lines, so that in the Saint Lawrence basin great sand belts extend across the country for miles, and are usually found on the lowlands, at the places that were once edges of ice-coverings. The rocks formed before the Glacial period are in some places covered by glacial deposit for from 100 to 200 feet. On the south side of the Saint Lawrence, at the lower foot-hills of the Adirondacks, may be found rock layers considerably below the surface. Old river channels were dammed, old valleys filled up, and new drainage channels formed. The new sub-basins were changed by the glacial deposit and the removal of former divides. The depressions where the Great Lakes are now were formed in part when the southern margin of the glaciers was obstructed north of the divide which extended through New York, Ohio, Indiana, Illinois, and toward the Northwest by the ice-block. The glacier south of the divide discharged its melted waters through streams flowing generally south. The outlets of the glacial streams from the north ice-covering were at first southerly. One was through New York State, near Ithaca, and through a portion of the Mohawk and Hudson River valleys to the Atlantic Ocean. Another was south of Lake Michigan along channels into the Mississippi Valley and to the Gulf. Another was from Lake Erie by way of Fort Wayne. At first there were only small but numerous depressions along the south margin of the northern glacier. They grew broader as the ice retreated slowly, and gradually merged into each other until the vast lake basins were formed which still preserve proof of their age in the Paleozoic strata that has undergone but little change. Mechanical and chemical agencies and erosion removed rocks and graded the lake beds.

The ancient beaches of the early lakes show that at one time the water occupied a greater space than at present. The Iroquois beach, south of Lake Ontario, is quite distinct, and shows that the old lake was much larger than the present Ontario (see New York). The ancient lake is supposed to have extended north to the glacier. There are shore-line marks south of Lake Erie some distance from the present shore line, and from 175 to 220 feet above the lake as it is now. East of Lake Huron are beaches showing a shore line from 25 to 260 feet above the present lake. This record of an ancient large lake is called Algonquin beach. The broad beaches of the ancient lake, of which the present Superior is a part, are on the north shore and extend the whole length. They range from 100 to 600 feet above the surface of the present lake. The soils within the area of the lake-beaches now beyond the lake limits differ from the soils farther inland. They possess many of the characteristics of inundated lands. The beach lands are not alike; near Lakes Ontario and Erie are masses of yellow sands, in some parts approaching a gravel, and between are large clay deposits. The Lake Superior beaches of the old lake show broad clay coverings, pinkish in color. The combined area of the lakes north and west of Superior which flow into Superior, is equal to one of the large lakes. (See articles on each one of the GREAT LAKES.)

**The Rivers.**—The main stream of the system was the last to assume its present form, when the ice covering left the region and the waters began the formation of channels extending to the sea. The streams from the divides gradually made their way to the lowest points of the valley, and entered the main stream. The main outlet channel, or the river Saint Lawrence, may be said to have its source at Lake Ontario and to extend to below Quebec, to the island of Orleans, where it becomes an estuary. From Lake Ontario until it becomes a tidal stream it is a surface river, of which the waters are remarkably clear. The distance from Lake Ontario to the Gulf is 750 miles. The descent from Lake Ontario to tide water is 230 feet. The Saint Lawrence forms the boundary line between the United States and Canada to lon. 74° 15' W., after which its course is wholly in Canada. In width the Saint Lawrence varies from one to three miles, until it broadens into a very wide stream; at Cape Gaspé it is over 50 miles wide. Just after leaving the United States boundary, the river expands and forms what is called Lake Saint Francis, and a little above the city of Three Rivers is another expansion called Lake Saint Peter. The chief tributaries are the Ottawa, Saint Maurice, Saguenay, from the north, the Chaudière, Richelieu, Saint Regis, Racquette, Grasse, and Oswegatchie, from the south. The Richelieu brings to the Saint Lawrence the waters of Lake Champlain. There are numerous beautiful islands in the Saint Lawrence; at the beginning of the main outlet, near Lake Ontario, there is a group (about 1,500 in all) called the "Thousand Islands." These islands are famous summer resorts.

**The Estuary and Gulf.**—The estuary beginning below Quebec, is 250 miles long, with an extreme width of 35 miles until it flows beyond Anticosti Island, where it widens, as has been

## SAINT LAWRENCE STATE HOSPITAL—SAINT LEGER

mentioned, at Cape Gaspé to over 50 miles. The greater part of the Gulf and the estuary are submerged portions of the river valley. A submerged river channel 800 feet wide has been traced to the eastern edge of the continental plain, about 100 miles from the present coast line. The marine shells found in the sands and clays above Montreal show that at one time the estuary began much farther up the stream than at present. The Gulf of Saint Lawrence has its mouth in the large island, Newfoundland. It enters the Atlantic by three channels; Cabot Strait, between Newfoundland and Cape Breton, about 65 miles wide; Strait of Belle Isle, between Newfoundland and Labrador; and Gut of Canso, between Nova Scotia and Cape Breton Island. The principal islands in the Gulf are Prince Edward Island, Magdalen Islands, and Anticosti.

**Navigation.**—Ocean steamers of the largest size ascend the Saint Lawrence to Quebec, and large vessels go as far as Montreal. Above are several rapids, and in Niagara and Saint Mary's River are falls. Steamers coming down the river often pass through the channels between the rocks of the rapids, but ascending the stream they have to go through canals which have been built to overcome the obstructions to navigation. The Welland Canal (q.v.), in Canada, furnishes a means of going around the Niagara Falls. Two canals, one on the American and one on the Canadian side, have been built at Saint Mary's Falls. Navigation on the rivers and lakes is closed in winter. The average number of days the Lachine Canal is opened during the year is 220. See CANALS; for history, see CANADA; UNITED STATES.

**Saint Lawrence State Hospital,** a State institution for the insane situated on the Saint Lawrence River near Ogdensburg, N. Y. It is built on the Cottage System (q.v.), and consists of three principal groups and two detached cottages. The central group includes a central administration building and 12 cottages and utility buildings which are detached except for a one story fire-proof corridor to facilitate communication. The cottages are two stories in height and are substantially and beautifully constructed of Potsdam sandstone and limestone. The cottages for men are on the west and those for women on the east of the administration building. The first is called Reception Cottage East or West and it is here the patients are admitted from home accompanied by a trained nurse sent from the hospital for that purpose. Every effort is made to give this cottage a home-like appearance and to avoid the depressing influence of a large institution. There is a cottage for convalescents, the doors of which are never locked and the patients are permitted to come and go at will. Other cottages are for the disturbed and noisy class, for the quiet and harmless, and for working patients. The Infirmary Group and Group Number Three are one fourth mile from the central group and each accommodates about 400 patients of the chronic classes. The Garden Cottage and Farm Cottage are each one mile from the administration building and are occupied by patients who are employed at gardening and farming. The Saint Lawrence State Hospital is chiefly remarkable as one of the first institutions to abandon the Kirkbride or block

system which dominated asylum construction in this country for 50 years and to establish in its stead a simple and more convenient plan. The first medical superintendent was Dr. Peter M. Wise, to whose genius the hospital owes its plan and organization. The hospital was opened for the reception of patients 9 Dec. 1890, but was not completed until 10 years later. It has accommodation for 1,700 patients and has 336 employees. The total expenditures for the fiscal year ending 1 Oct. 1903 were \$276,750.96; annual expenditure per patient, \$161.89. The value of real estate including buildings, \$2,500,600; value of personal property including furniture, etc., \$143,000.

R. H. HITCHINGS,  
Superintendent.

**Saint Lawrence University,** located at Canton, N. Y. It was chartered in April 1856; the theological school was opened in 1858, the collegiate department in 1859; a preparatory school also was organized, but was discontinued in 1864. The collegiate department is unsectarian, the theological school is Universalist; the two institutions are under the control of one board of trustees, but the seminary has a separate building, faculty, and funds. From 1869 to 1872 a law school was conducted, and in November 1903 a Law Department was again established by the incorporation of the Brooklyn Law School as an integral part of the university under the name of the Brooklyn Law School of Saint Lawrence University. The university, therefore, consists of three departments: (1) the college of letters and science; (2) the theological school; (3) the law school. The college offers two courses, one leading to the degree of bachelor of arts, the other to the degree of bachelor of science; the work of the first two years in each course is prescribed, of the last two years largely elective; the bachelor of arts course is divided into three groups, according to the second language (other than Latin) offered for admission. Thirty scholarships are provided. The main departments of study in the theological school are ethics, history, theology, comparative religions, homiletics, sociology, church administration, psychology, and interpretation and criticism; the full course occupies four years. In the law school the two years' course of study leads to the degree of LL.B., the three years' course to the degree of LL.M. All departments of the university are open to women. The buildings on the Canton campus include the main building, the Herring Library, the Cole Reading Room, the gymnasium, and the seminary building. The library contains about 25,000 volumes; the productive funds amount to \$400,000. The students (1910) numbered 200 in the college, and 514 in all departments.

**Saint Leger,** *saint lèj'ér* or *sil'én-jér*, Barry, British soldier: b. 1737; d. 1789. He served in the siege of Louisburg in 1758, and under Wolfe at Quebec, and checked the flight of the French forces at the Heights of Abraham. He was also the leader of the expedition against Fort Stanwix in the American Revolution. At the close of his career in the British army, in 1784, he was commandant of the royal forces in Canada. His 'Journal of Occurrences in America' was published in London in 1780.

## SAINT LOUIS

**Saint Louis**, *sint loo'is* or *loo'i*, Mo., city, port of entry; on the west bank of the Mississippi River, about 20 miles below the mouth of the Missouri. It is the metropolis of the State, and by the Federal census of 1910 ranks fifth in population among the cities of the United States.

**Topography.**—The city stands on a gentle bluff with an average elevation of 100 feet above the river and about 500 feet above the sea. It stretches along the Mississippi a distance of 19 miles, and its greatest width, east and west, is six and one half miles; the area is 61½ square miles. The surface is rolling and drainage by the city sewer system has been easily accomplished. "Mill Creek" Valley, which extends east and west and bisects the city was once the bed of a lake (Chouteau Pond). It is used chiefly for depots, railroad yards, and industrial establishments. Bridges and viaducts carry street traffic across the valley. The Mississippi River borders the city in the form of the arc of a circle, the city on the concave side. In the river are several islands; the largest Cabaret and Kerr belong to Illinois. The river is here a vast torrent of turbid water which picks up and drops again large masses of sand and silt as the river rises and falls. It is very deep abreast the city, and in good water there is a continuous depth of 12 or 14 feet all the way to the Gulf of Mexico. It regularly rises and falls during the year about 25 or 30 feet. High water mark is 412.7 feet above sea-level. The historic water mark of 1844 still remains unsurpassed, though in June 1903 the water was but four or five feet lower. In each case the broad bottom between the channel and the Illinois bluffs was flooded and looked like a vast inland sea. In no case has the river climbed far up the bluff upon which Saint Louis is built. West of the city the land spreads out in a picturesque plateau.

**Climate.**—The latitude of the city is about 36° 38', so that it is entitled to a mild winter and a warm summer. Fair summer winds are south and southwest, and the cool winds come from the north and northwest. The record of the United States Weather Bureau is here given for the highest and lowest temperature for the twelve months, January to December, 1909, and the normal or mean temperature, respectively:

|                     |                      |                       |
|---------------------|----------------------|-----------------------|
| Jan., 74°, 32°, 31° | May, 94°, 32°, 66°   | Sept., 108°, 37°, 70° |
| Feb., 78°, 18°, 34° | June, 102°, 44°, 75° | Oct., 91°, 34°, 58°   |
| Mar., 60°, 3°, 44°  | July, 107°, 25°, 70° | Nov., 83°, 5°, 43°    |
| Apr., 61°, 22°, 56° | Aug., 106°, 33°, 77° | Dec., 74°, 17°, 30°   |

The annual rainfall is 37½ inches. The longitude of the city is about 90° 15' west from Greenwich; hence "Standard Central" time is about one minute faster than "Mean Solar" time.

**Transportation.**—In 1874 the Eads Bridge (q.v.) was opened for highway and railroad traffic. Prior to 1874 Saint Louis had no bridge over the Mississippi, and in times of ice gorges and ice-runings direct communication with the East, at this point, was cut off for days. The Merchants' Bridge, three miles up-stream from Eads Bridge, was built in 1890. Twenty-seven lines of railroad meet in Saint Louis Union Station; 10 from the west and 17 from the east, the latter crossing the river by the

Eads Bridge and the Merchants Bridge. Vast quantities of freight cross the river by ferries and are handled by steamboats. Nearly all the coal used in the city crosses the river or comes up the Mississippi in barges. Terminal facilities have lately been greatly increased and the tunnel running from the Eads Bridge to Cupples Station is used for merchandise almost exclusively.

The Union Station with its spacious train shed large enough to house 32 tracks, each one long enough to accommodate 11 passenger coaches, is unique in construction and use. All trains "back in" to the station, stopping at the Midway, an area 130 feet wide and 601 feet long, crossing the station from 18th to 20th streets. Freight, mail matter, and express are handled in subterranean driveways and passages, with the use of 26 elevators. The station covers 13.2 acres of ground. The capacity of the station has recently been increased 200 per cent.

**Commerce and Industries.**—Saint Louis is the natural commercial metropolis of the territory lying to the west and south, including Texas and Mexico. In manufactures it has always been prominent, and it is now the fourth city in the United States in the value and output of its manufactures. The value of the products of the factories of Saint Louis is estimated at about \$400,000,000. If the factories of East Saint Louis, Venice, Madison, and Granite City, all lying just across the river and forming parts of this industrial centre, are included, the annual product amounts to about \$400,000,000. The annual sales in dry goods and kindred lines amounted to \$120,000,000; the sales of boots and shoes alone amounted to \$50,000,000, nearly one half of the stock being made in the city. The trade in tobacco and cigars, nearly all manufactured here, footed up \$41,000,000; in beer, \$18,000,000; in street cars, \$15,000,000.

The most interesting and the most important commercial feature in Saint Louis is Cupples Station, which deserves an extended description. There is not in the world a similar establishment which approaches it in magnitude and completeness of organization. Cupples Station was planned and inaugurated by Robert S. Brookings, the vice-president and general manager of the Cupples Wooden Ware Company. The object of the station was to save expense, time, and wear and tear in handling merchandise. Expense was to be saved chiefly by the elimination of drays and street wagons drawn by horses. Time was to be saved by reducing the handling to one half, and storing goods in buildings adjoining the station platforms. The saving in wear and tear was to result from less handling and no street hauling. All these ends have been attained. All the 25 lines of railroad converging in Saint Louis haul freight to and from the terminal yards lying between Eighth Street and Grand Avenue. Cupples Station occupies nearly four acres of ground at the east end of the yards on both sides of the main tracks as they leave the tunnel at Eighth Street and Clark Avenue. It owns and controls switches and platforms sufficient for 60 cars, all practically under cover. The 20 big buildings alighting the tracks are occupied by some 30 tenants, including some of the largest concerns in the city dealing in hardware, woodenware, and groceries. The total mer-

Digitized by Google

## SAINT LOUIS

merchandise handled by Cupples Station is valued at about \$40,000,000 annually, of which \$25,000,000 represents the business of two firms, each the largest of its kind in the world—the Simmons Hardware Company, and the Samuel Cupples Woodenware Company.

There is a single power-plant for the entire station furnishing heat, light, and power, either electric or hydraulic. The platforms for the handling of goods have a total area of 30,000 square feet, and are on two levels, one by the car doors, and one a story higher. These levels are connected by seven elevators operated by the station employees. The tenants operate 44 elevators to all floors in their respective quarters. The station has over 4,000 four-wheeled trucks, each easily drawn by hand and capable of carrying a load of 5,000 pounds. These trucks carry all the merchandise handled in Cupples Station.

The manner of operating the station is as follows: During the night the various railroads having freight to deliver to Cupples Station place their cars upon the switches adjacent to the lower platforms. At 7 A.M. a force of about 200 station employees open and unload the cars, place the goods upon trucks, and deliver them at the doors of the tenant firms according to their destination. By 9 A.M. the cars are empty, and the goods are for the most part piled away in the respective buildings. Soon the trucks begin to reappear loaded with goods which are to be shipped. These are taken in hand by the station employees in the freight-receiving room on the upper platform; bills of lading are signed; and the trucks are sorted according to a schedule which specifies the order in which cars shall be loaded and immediately removed by the different roads. Each railroad knows just when to send an engine for its cars, and the station forces always see that the cars are ready. The employees of the tenant firms go scarcely beyond their own doors. About 25 per cent of the goods received are delivered at the street doors of the various firms to meet local demands. In this systematic and economical way over 30 cars with 1,000 tons of assorted merchandise are received and shipped in a day, or 300,000 tons in a year. No other single freight station approximates that amount of business. The sight of the station in full activity is most impressive. The constant passing of hundreds of loaded trucks; the simultaneous motion of many elevators; the loading and the despatch of cars,—all this is at first confusing, but a deeper insight detects a perfect, harmonious system which wins the admiration of every attentive visitor.

One further fact remains to be stated, namely, that Samuel Cupples and Robert S. Brookings, the original owners and builders of this great enterprise, and the owners of several neighboring blocks occupied by firms which could not be accommodated in the station, have given the entire property to Washington University, as a permanent endowment for the cause of higher education.

**Banks and Trust Companies.**—Not to mention the smaller banks, the capital of 20 of the larger banks and 10 trust companies in 1902 amounted to \$42,315,800; their surplus was \$44,951,373, making a total of \$87,267,173. The clearing-house statement shows that the clear-

ings for 1910 of the whole city amounted to \$3,704,263,700.

**Municipal Improvements.—Parks and Boulevards.**—The city has 18 public parks, containing 2,125 acres. The four large parks, Forest, O'Fallon, Tower Grove, and Carondelet, have recently been connected by a system of boulevards carried across Mill Creek Valley on a magnificent viaduct. Lafayette Park (30 acres) was early improved and seven years ago was the gem of the city. Its wealth of elms, maples, sycamores was almost entirely destroyed by the great cyclone of 27 May 1896. Out of 700 forest trees 575 were broken and ruined. During the season which followed over 1,000 young trees were set out, to begin again the work of rearing a forest of ornamental trees. The cyclone destroyed property in the city to the amount of ten million dollars, and killed some 160 people. Shaw's Garden, the popular name of the Missouri Botanical Garden, was the gift to the people of Saint Louis of the late Henry Shaw. It is beautifully laid out, and full of a vast variety of flowers, trees, and shrubs, collected at great expense from all lands, and most carefully cultivated and housed. The Flower and Plant Garden contains 9.4 acres; the Arboretum, which contains specimens of all trees known which are hardy enough to survive the climate, covers 20.5 acres; the Fruticetum, which contains an extensive collection of hardy fruit trees and plants, extends over eight acres; other grounds near and tributary to the Shaw residence amount to 6.8 acres, making a tract of 45 acres.

Adjoining the Arboretum and vegetable garden is a pasture area of some 80 acres, of which one fourth has recently been graded, drained, supplied with water, and partially planted with North American plants arranged in the familiar sequence of families adopted by Bentham and Hooker; while the remainder will shortly be molded and planted to exemplify the more modern arrangement of Engler and Prantl, on plans already largely prepared. The Botanical Library contains 18,550 books, 22,608 pamphlets, and 66 manuscript volumes. The herbarium contains 400,000 sheets of specimens.

The ownership of the Missouri Botanical Garden is vested in a board of trustees which is charged with the care and maintenance of the garden and the administration of income-bearing property valued at some \$4,000,000, the net income of which shall be spent upon the garden. With this munificent endowment the trustees are able to constantly improve, extend, and enrich the garden. The Henry Shaw School of Botany is conducted as a department of Washington University.

Tower Grove Park contains three fine bronze statues: Shakespeare, Humboldt, and Columbus, designed and executed by Müller of Munich, the gifts of Henry Shaw. Forest Park, two miles long by a mile in width, was a wooded tract of great variety and rare beauty, but one half of it has been loaned to the Louisiana Purchase Exposition Company, and what was for the most part an irregular grove of magnificent forest trees is now covered by a series of exposition buildings, which in extent and splendor stand unrivaled on the face of the earth. The winding Des Peres River is buried

## SAINT LOUIS

out of sight; the little lake is filled and covered with magnificent palaces. A mile of lagoons with curving banks of grass and flowers, and many a springing bridge, fill the scene with an amazing wealth of beauty and variety, utterly and entirely new—so great and wonderful is the transformation.

Of all the exposition structures now standing within the limits of Forest Park only the Art Building is to be permanent.

**The City Waterworks.**—The city waterworks consist: First, of a pumping station and settling basins several miles above the city proper, on the west bank of the Mississippi, a few miles below the mouth of the Missouri. Second, of a conduit leading the water from the settling basins to the pumps at Baden and Bissell's Point. Third, the high-service pumping engines, where the water is pumped into the city mains or into Compton Hill Reservoir, several miles away to the south. Fourth, a system of pipes along every street and to every house, so that the supply is abundant everywhere. All old wells are filled and spring water is no longer used. A water tower near the reservoir furnishes high-pressure water through a separate system of pipes to residences on high ground. The capacity of the works at present is 120,000,000 gallons per day. The average daily consumption is 67,179,600 gallons, or at the rate of over three barrels per day for every man, woman and child in the city. The total length of all underground water pipes of all sizes is over 700 miles.

The Mississippi water coming from northern lakes and from the distant slopes of the Rocky Mountains, though heavily laden with mineral matter and more or less stained with vegetable matter from alluvial fields and forests, was until recently exceptionally wholesome, and when filtered was as clear as crystal. The drainage of river towns and mills was of course objectionable, but before the time when the city of Chicago, with a population exceeding the whole State of Missouri outside the limits of Saint Louis, poured its drainage through the Illinois River into the Mississippi, 40 miles above Saint Louis, the water pumped at Saint Louis was considered excellent. The present condition of the water is unsatisfactory in the extreme. Plans are being made to filter the entire water supply of the city and to eliminate, by legislation or otherwise, the vast evil of Chicago sewage.

The income from the "water rates" can be spent only in the water department. The unappropriated balance on hand in April 1903 was over \$2,000,000, nearly sufficient to build a filtration plant which shall filter all the water used.

**Sewers and Streets, Street Cars, etc.**—There are 530 miles of sewers and 450 miles of paved streets. The streets are in general macadamized, but about 110 miles are paved with granite blocks, asphalt, or brick, and there are 85 miles of Telford pavement dressed with fine hard gravel. All streets are sprinkled daily throughout the summer months, and the granite and brick pavements are swept and washed. The city is not densely built, as good building ground is abundant; consequently the residence districts extend far into the country. This extension is favored by an admirable supply

of street railways and cars. There are 337 miles of single street tracks at present, under two separate managements. All cars are run by electricity, with overhead trolleys, and the system of transfers is quite general. At present there are no underground or elevated electric roads in Saint Louis.

In numbering the houses one hundred numbers are assigned to each block, counting westward from the river, and north and south from Market Street. The odd numbers are on the north and west sides. Thus, 2305 Pine Street is on the third house lot west of 23d Street, on the north side of Pine Street.

**Education.**—The public schools are administered by a Board of Education which is independent of the city government, having its separate charter, and by the Constitution authorized to levy and expend taxes for school purposes. The rate of school tax is by the Constitution of the State limited to six mills on a dollar. The tax actually levied by the Board of Education in 1903 was five mills. The board consists of 12 members elected for six years on general tickets embracing the entire city; four members retire every two years unless re-elected. The expert officers charged with the business of conducting the schools under the authority and supervision of the board are: a superintendent of instruction, a secretary and treasurer, an auditor, a commissioner of buildings, and a supply commissioner.

A normal school is in course of construction which will receive 300 pupils; there are three first-class high schools, with accommodations for 4,000 pupils; a colored high and normal school for 300 pupils; and 91 district schools, of which 12 are for colored children under the care of colored teachers. The enrolment for day schools in 1910 was 87,931; for evening schools, 3,353. The number of teachers was 2,027. The cost of maintenance for every pupil in the day schools is about \$21.

The estimated revenue for public schools from all sources, including its quota from the income of the State school fund (\$202,251.16) is about \$1,000,000.

The first year of the school course is devoted to kindergarten instruction and training in 78 kindergarten rooms, specially built and fitted for the purpose. Book work may begin in Grade I. at the age of seven. At the end of the VII. Grade, at the normal age of 14, the child should be fitted for a high school. In the high schools, pupils may choose a classical course, a general literary and scientific course, or a mixed course, including manual training or domestic art and science. In the two highest grades of the district schools the pupils receive one lesson per week in manual training—the boys in mechanical drawing and elementary woodwork, the girls in domestic science (sewing, cooking, and household economics). There is a school for the deaf, enrolling 34 pupils and five teachers.

All day schools are taught 40 weeks a year. There is no law compelling school attendance in Missouri, consequently in spite of a high degree of excellence pervading all grades of the public schools, a few children are allowed to grow up in ignorance. The superior quality of the public schools of Saint Louis is a matter of common observation. This is due to teachers

## SAINT LOUIS

thoroughly trained and carefully supervised; and to buildings well equipped. Appointments and reappointments are on merit alone. School houses are now built strictly fire-proof, with every valuable modern convenience.

A vigorous Pedagogical Society containing 400 members, chiefly public school teachers, marks progressive ideas; and a Teachers' Benevolent Annuity Association, with 1,100 members, indicates a desire to co-operate and render mutual aid. The members pay one per cent of their salary as annual dues, and after 25 years of service as teachers (15 in Saint Louis) the women (for men the service is 30 years) may on retiring receive an annuity for life. Twenty persons at one time received annuities. The association has invested a permanent fund amounting to \$48,606.50. This is increased every year by dues, gifts, and an occasional festival held for the purpose, and with such aid this work is being extended.

Washington University is a generously endowed and finely equipped institution for higher and professional education. The charter of the university was signed by the governor of the State on 22 Feb. 1853, hence the name "Washington." It was originally called Eliot Seminary, in honor of its organizer, first president, and third chancellor, Dr. William Greenleaf Eliot. By the terms of its charter the university is strictly non-partisan in politics, and non-sectarian in religion. Hence certain questions are never asked when a professor's chair is to be filled or a tutor is to be appointed. The College was inaugurated in 1857; the Law School was organized in 1867; the Engineering Department in 1870, and Architecture was added in 1900. The School and Museum of Fine Arts became a department in 1870; and the School of Botany in 1885. The Saint Louis Medical School (founded in 1842) was admitted to the university in 1891. The Missouri Dental College was admitted in 1892. In 1899 the Missouri Medical College (founded in 1840) was admitted, forming with the Saint Louis Medical College the Medical Department of the university.

Prior to 1903 the university had no campus; its nine departments were scattered about the city on different blocks and on several streets. The large campus of 113 acres and a group of 11 beautiful granite buildings, erected by the university and occupied during the Fair by the officials and attachés of the Louisiana Purchase Exposition, became the permanent home of the Undergraduate Department in 1904. As additional buildings are needed they will be placed on lines indicated, thus forming a succession of quadrangles from east to west.

The secondary schools: Mary Institute, for girls, and Smith Academy and the Manual Training School for boys, are permanently located north of Forest Park, about a mile and a half from the university campus. The Manual Training School was established by ordinance 6 June 1879, and opened as an independent school, with a complete course of study and training for boys of secondary grade in September 1880. For 25 years it occupied the original building at 18th Street and Washington Avenue. It enrolls annually about 300 boys. The total enrollment in the university is 2,219 students, and 209 instructors. Its property in educational

buildings, grounds and equipment is \$2,570,000; its endowment \$3,180,000.

The Saint Louis University (Roman Catholic), which dates back to 1869, is a large and flourishing institution on Grand Avenue. Its library of about 38,000 volumes is rich in old books in many languages, huge in size and quaint in binding; the Christian Fathers in Latin, Luther's first editions, the Bible in 27 different languages, are interesting examples. One hundred and nineteen quarto volumes, the gift of the English government in 1831, contain the "Records of the English Government" starting with 'Doomsday Book' and ending with George IV.

The College of Christian Brothers (q.v.) occupies a most imposing structure on the high ground west of Cote Brilliante. Forest Park University for young ladies occupies a most attractive building and site immediately south of Forest Park. There are several independent medical schools, a college of pharmacy, a law school, giving instruction exclusively at night, and numerous convents, seminaries, and parish schools.

**Libraries.**—The Public Library, with 170,000 volumes, is free to all residents. The city contributes annually the income of a tax of  $\frac{1}{4}$  of a mill, yielding in 1903, \$166,000. Andrew Carnegie has generously given \$1,000,000 for the erection of a central library building and branches; the branch libraries to be built in different parts of the city. The erection of these buildings was begun in 1905. A site for a branch library has been presented by Mr. and Mrs. William Barr. There are scattered throughout the city 59 delivery stations for books. The Mercantile Library, containing 127,000 volumes, offers special favors to clerks, and is housed near the commercial centre of the city. It is provided with a fine reading room and a list of 562 periodicals. The present number of annual memberships is 1,603; of life memberships, 516; and of perpetual memberships, 1,310. The walls and niches of the reading room and lobby are decorated by 57 works of art: paintings and statues.

**Government and Finance.**—The mayor, the council (13) and the house of delegates (28) are elected for four years; the councilmen at large, and the delegates one from each ward. A Board of Public Improvements, consisting of a president, a water commissioner, a street commissioner, a sewer commissioner, a harbor commissioner, and a park commissioner, is organized every four years. All the commissioners are appointed by the mayor and confirmed by the council. The three commissioners first named must be educated engineers. The Board of Police Commissioners (excepting the ex-officio member, the mayor) and the Board of Election Commissioners are appointed by the governor of the State, and are quite independent of municipal control, though all their bills must be paid by the city, the penalty for a negative vote on such bills in the city council being disfranchisement.

The assessed value (real and personal) of the city in 1910 was \$504,391,890. The public debt was \$23,853,178.30; and the tax rate \$2.22 per \$100. The year of the World's Fair the bonded debt was \$23,500,000, includ-

## SAINT LOUIS

ing \$5,000,000 given in bonds to the Fair. The city's revenues are about \$10,000,000.

**Hotels.**—Saint Louis is well provided with over 100 hotels, large and small, with accommodations for 21,000 guests. The Planters, The Southern, and The Lindell are first-class in all respects, being new buildings with old names on old sites. During the year 1903 new hotels are going up with capacity for 47,000 guests; many of these, like the Washington, Hamilton, and Jefferson, will be permanent and first-class. A novel feature of the Fair is an "Inside Inn," 400 by 800 feet, capable of receiving 6,000 guests, within the Fair grounds, so that visitors may actually live within the gates.

**History.**—Saint Louis was founded 14 Feb. 1764, by a party of Frenchmen under Auguste Chouteau, a 14-year-old boy, who had been sent up from New Orleans by his step-father, Pierre Laclède Liguest, to establish a settlement on a site already selected as a post for trading with the Indians. The little village was named in honor of Louis IX. of France. By secret treaty France had already, in 1763, ceded the entire territory west of the Mississippi to Spain, but no knowledge of the treaty was received in Louisiana for some years, and the settlement remained French. In 1765 Saint Louis was made the capital of Upper Louisiana, with Saint Ange de Bellerive as governor. In 1769 the village of Saint Louis contained 17 white men, 16 white women, and 17 negro slaves. In 1770 the Spanish took formal possession, and Don Pedro Pierras was inaugurated governor 29 November. The village remained under Spanish control for 33 years. By another secret treaty Spain ceded the territory back to France, 1 Oct. 1800, and on 30 April 1803 Napoleon sold the entire territory to the United States. (See LOUISIANA PURCHASE.)

The formal transfer of Upper Louisiana from Spain to France took place on 9 March 1804. Capt. Amos Stoddard of the United States army had been commissioned by the French Republic to receive the territory from the Spanish governor, Delassus. On the next day, 10 March 1804, Capt. Stoddard in the presence of a few apathetic French people and a company of United States troops lowered the flag of France and raised the Stars and Stripes and assumed control of Upper Louisiana in the name of the United States. It is said that the only demonstration attending this ceremony was a call for three cheers for the new authority by a prominent citizen, Charles Gratiot. Thus for 40 years Saint Louis had been under France and Spain. General (afterward President) Harrison, who a few months later was in command of the United States post at Cahokia, Ill., organized the new local government. The population at that time was about 1,000 whites and 300 or 400 slaves and free mulattoes.

No sooner was the Louisiana Territory a part of the United States than settlers swarmed across the great river, and in a few years emigrants from Germany in great numbers settled in and near Saint Louis, so that the French became a small minority of the population; but the memory of the early families is well preserved in the names of streets, schools, and parks. The names of Laclède, Chouteau, Gratiot, St. Ange, and Stoddard have already

been mentioned. Carondelet, Gravois, La Salle, Papin, Cote Brillante, Dodier, Soubard, Céré, Lucas, Dillon, Lafayette, Dozier, Des Peres, Marquette, and others, are reminders of the early history of the city and Territory. King's Highway, an avenue destined to be one of the most beautiful in the city, is a relic of the broad highway originally laid out for the King of Spain, running on the king's land from the rear of Saint Louis village to New Madrid, hundreds of miles south. The pseudonym of "Mound City" arose from the fact that on the east side of Broadway at about Mound Street, there was formerly an immense Indian burial mound; it was removed in 1866.
